The steering column is adjustable electrically for reach and rake. The column can be adjusted for 40.00 mm (1.57 in) of reach adjustment and 6 degrees of rake adjustment. The adjustment mechanism comprises an electric adjustment motor, a lead screw, a rake solenoid, a reach solenoid, a rake clutch and a reach clutch.

The column adjustment is controlled by the driver using a joystick switch located on the left hand side of the column cowl. The joystick can be moved forward and backward to adjust the column reach in and out and moved up and down to adjust the rake. The single electric motor is used for both adjustment ranges. The switch selection s the applicable solenoid, engaging the applicable clutch on the lead screw.

When selected by the Auto function on the joystick adjustment switch, the steering column will adjust to the uppermost tilt position when the key is removed from the column lock barrel, and re-adjust to the previous set position, when the key is re-inserted.

For the reach adjustment, the lead screw drives the outer housing in or out as required. For the rake adjustment, the lead screw drives a rake lever which moves the column up or down as applicable.

The pivot housing is attached to the roof bracket with two pivot pins. When the rake adjustment is operated, the pivot housing rotates around the pivot pins to allow for the up and down adjustment, but maintains a positive location to the roof bracket.

The electric column is linked to and controlled by the memory control module. The memory control module provides storage of three separate memory positions which are stored against three individual vehicle keys.
For additional information, refer to: Seats (501-10 Seating, Description and Operation).
The electric column also has an easy egress feature which lifts the column to its maximum rake to allow easier access to the vehicle.

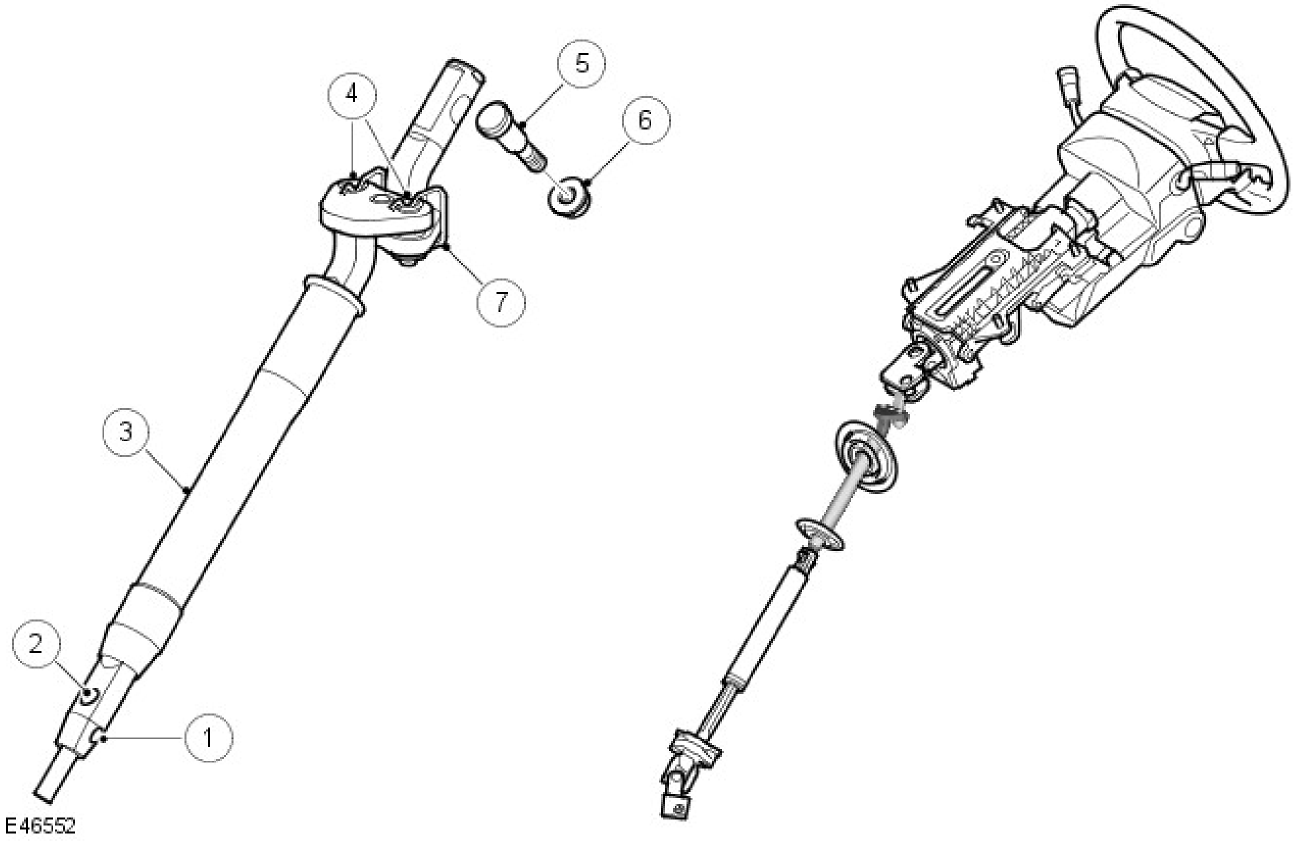
In the event of a high energy frontal impact, the upper column assembly is designed to collapse reducing impact injury to the driver. A number of components interact together to ensure that the collapse of the column is in a controlled manner. The following components control the column collapse:

- Shear pin
- Strap
- Upper and lower shaft (splined) connection.

The strap is rectangular section steel, which is secured by two Allen screws to the outer housing and by a shear pin to the strap guide. The strap provides the main element for energy absorption as the column collapses. To initiate axial movement of the column, the shear pin has to be severed, friction between several column interfaces has to be overcome, and an axial load applied sufficient to initiate strap guide deformation. Once the column is telescoping, deformation of the strap guide, and sliding friction between column interfaces, absorbs the energy of the occupant in a controlled manner, as the column collapses.

WARNING: Do not attempt to dismantle the steering column. The crash safety of the unit will be compromised.

INTERMEDIATE SHAFT



Item	Part Number	Description
1	-	Alignment slot
2	-	Attachment hole
3	-	Seal sleeve
4	-	Load limiter pins
5	-	Cam bolt
6	-	Self-locking nut
7	-	Retention spring

CAUTION: Care should be taken when handling the intermediate shaft, to ensure that it is not subject to impacts or that the retention spring is not displaced.

The non-handed, intermediate shaft is attached at its upper end to the swivel yoke on the lower shaft of the steering column assembly. The intermediate shaft comprises two main parts; the upper and lower axis which are joined together with a shear joint.

The upper axis has a cut-out in the shaft which allows for the fitment of the cam bolt. Only when the shaft is located correctly in the swivel yoke, can the cam bolt be inserted. A self-locking nut is fitted to the cam bolt. The torque applied as the nut is tightened, rotates the bolt, forcing the cam against the shaft, positioning it correctly in the swivel yoke prior to the joint being clamped.

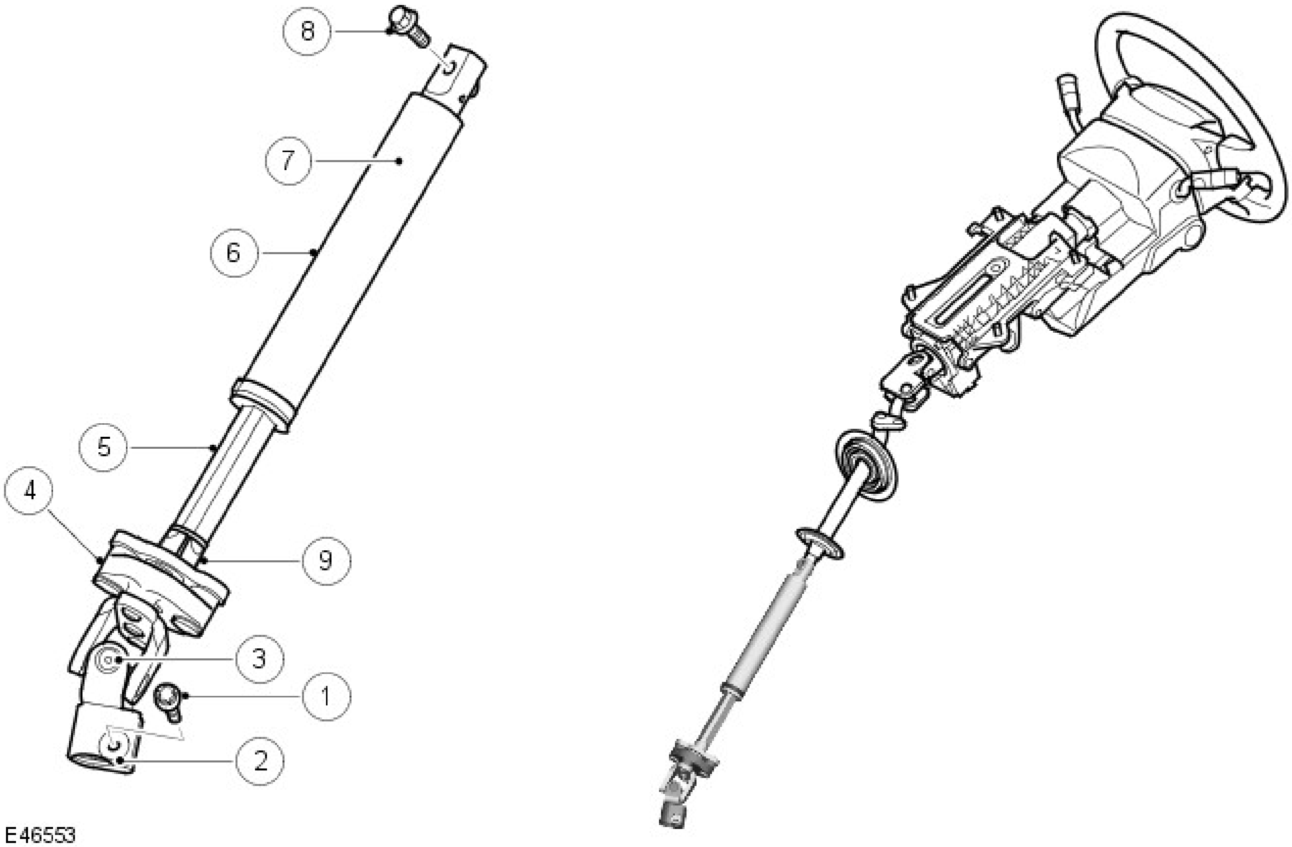
- NOTE: If the self-locking nut is removed for any reason, it is recommended that a new, correct nut is fitted to maintain the optimum torque on the cam bolt.

The lower axis is fitted with a plastic molded seal sleeve which provides a suitable surface for the location of the plastic bearings within the two bulkhead seals. The bottom of the lower axis is machined to a double 'D' shape which tapers at the end. One side of the taper has a slot which is used to align the intermediate shaft and the lower collapsible shaft to ensure that the correct orientation of the steering wheel to steering gear is maintained. A hole is drilled through the double 'D' shape and provides for attachment of the intermediate shaft to the lower collapsible shaft.

The upper and lower axis, are joined together via a load limiter. The load limiter is designed to disconnect the upper and lower axis in the event of a high energy frontal impact preventing an excessive load being applied to the steering column (causing intrusion into the passenger compartment or an unstable airbag deployment).

The load limiter comprises two plates which are part of the upper and lower axis. The plates have a central 'guide' pin, and two retention pins, which pass through bushes in the plates, onto which a rubber and steel washer are staked in position. The size of the staking controls the load at which the lower axis separates from the upper axis. A wire 'retention' spring is also fitted to the load limiter.

LOWER COLLAPSABLE SHAFT



E46553

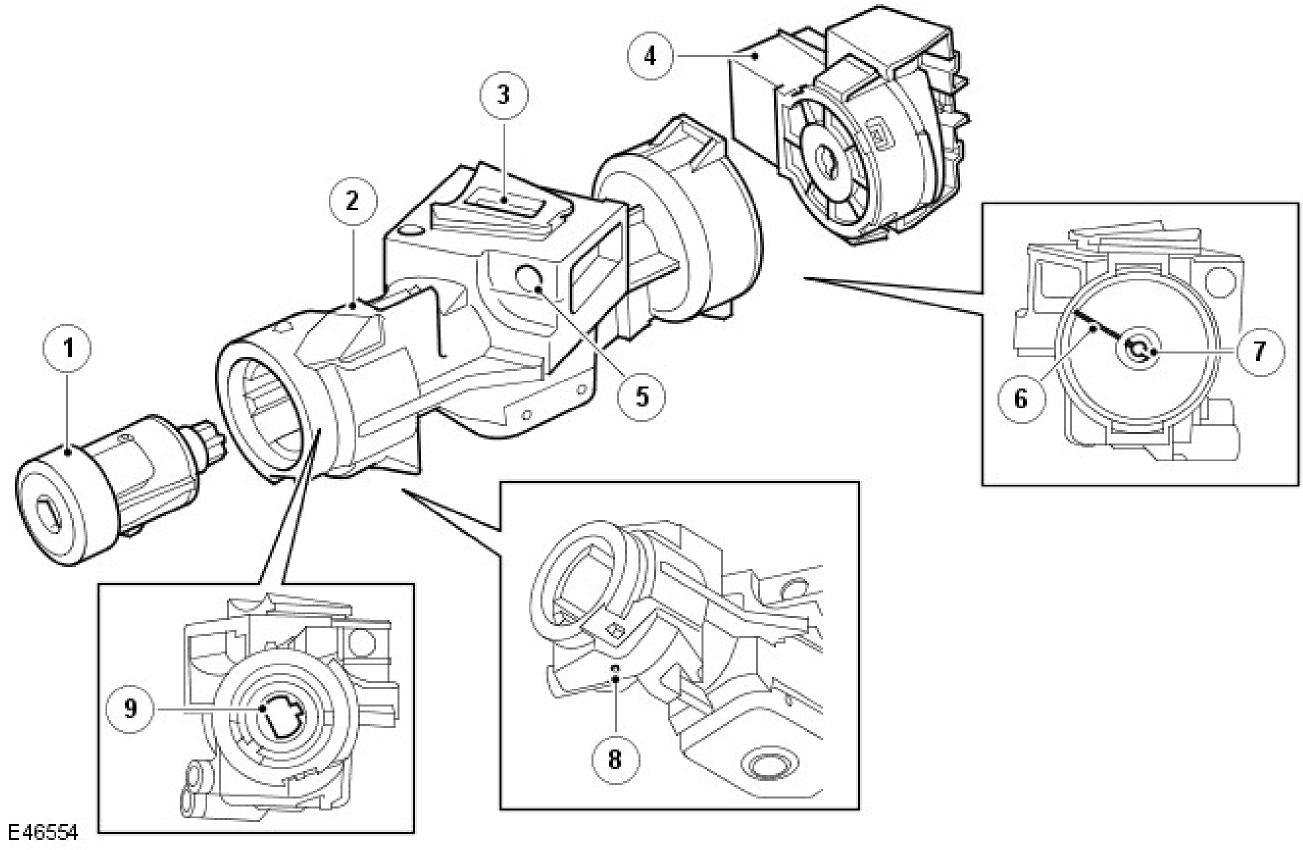
Item	Part Number	Description
1	-	Torx bolt
2	-	'U' yoke
3	-	Universal joint
4	-	Flexible coupling
5	-	Male shaft
6	-	Female shaft
7	-	Heat shield
8	-	Bolt
9	-	Plastic spacer

The lower collapsible shaft is a handed component and the correct component must be fitted to ensure that the steering phase angle is maintained. The shaft is attached at its upper end to the intermediate shaft and at its lower end to the valve unit pinion on the steering gear. These attachment joints can only be fitted in one orientation to ensure the correct alignment of the steering wheel to the steering gear. The shaft comprises two female and male shafts which are a telescopic fit on each other. The male shaft can slide up to 77 mm (3.03 in) within the female shaft in the event of a frontal impact, to minimize the effect of frontal intrusion. The sliding fit also allows for dynamic displacement between the chassis and the body during severe off-road driving. A plastic spacer is fitted to the male shaft which is only used as an assembly aid during vehicle production and serves no function once the shaft is assembled to the vehicle.

The female shaft is a triangular section tube which is formed to a double 'D' hole at its upper end which mates with the intermediate shaft. An indentation pressed in the wall of the tube ensures the correct alignment between the intermediate shaft and the lower collapsible shaft. A captive nut, clinched to one side of a hole in the double 'D' section, allows for the fitment of a patchlock bolt to secure the intermediate shaft. Clamped around the end of the female shaft is a dust seal which prevents the ingress of dirt and moisture into the sliding joint, and a heat sleeve is also fitted to reflect radiant heat from the exhaust.

The male shaft is a triangular section tube which is staked at its lower end into a flange. A cage and curved 'spring plates' are fitted to its upper end, which slide in the female shaft. A pin is fitted into the side of the female tube, to secure the male tube in the bore. The lower end of the male shaft is fitted with a flexible coupling to absorb vibration and steering 'kick back', transmitted from the steering gear. A 'stabilizing pin' is fitted through the coupling to prevent coupling articulation (acting as a universal joint), while still allowing rotational flexing and plunge movement. The coupling is a rubber molding within which are nylon fibres wound around the attachment holes to transmit torque applied to the steering. The coupling is attached to a drive flange (which is part of the male shaft), and to the 'U' yoke which in turn is connected to the pinion yoke, by the universal joint assembly.

STEERING COLUMN LOCK



Item	Part Number	Description

1	-	Ignition barrel
2	-	Column lock assembly
3	-	Lock bolt
4	-	Ignition switch
5	-	Attachment hole
6	-	Alignment mark
7	-	Switch drive
8	-	Barrel release hole
9	-	Barrel drive

The column lock comprises a cast housing which contains the locking components. The unit is assembled and sealed with a cover which is secured with roll pins into blind holes. The column lock is not a serviceable part and must be replaced as a complete component. The lock has a locking bolt which moves up and down on a cam. The cam is part of a shaft which runs through the lock and is operated by rotation of the ignition key in the ignition barrel.

The column lock is attached to the column with two shear bolts. When the column lock is fitted to the column, the bolts are tightened to a specified torque which shears off the heads of the bolts, preventing easy removal of the column lock.

⚠CAUTION: Before removing the ignition switch and/or key barrel, ensure the lock is in key position I. Ensure that the shaft is not rotated from this position when the ignition switch has been removed from the column lock. If the shaft is rotated beyond key position 0, a plunger and spring can become unseated from the lock bolt, causing incorrect operation of the column lock. . If the plunger is not correctly located in the lock bolt, the lock is not serviceable and must be discarded.

The ignition barrel is fitted to the right hand end of the column lock. The lock is pushed into the bore and locks in position. Removal and fitment of the barrel is achieved by inserting the ignition key into the key barrel and turning to position I. To remove from the column lock, a suitable probe must be inserted through the release hole to depress the locking plunger on the key barrel. The key barrel can then be pulled from the lock using the key.

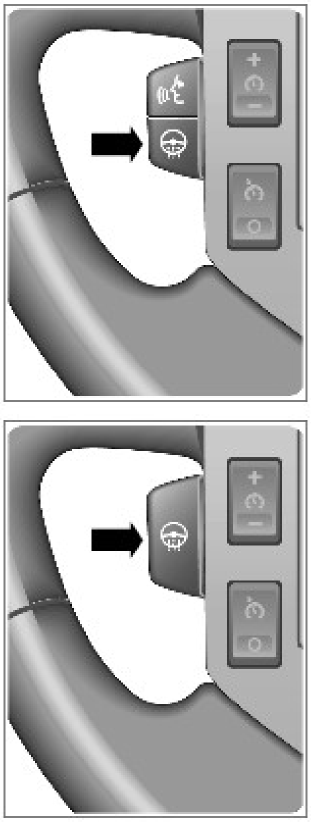
The ignition switch is fitted to the left hand end of the column lock. The ignition switch is pushed into the bore and two plastic clips locate in slots in the lock to retain the switch. Removal of the ignition switch is achieved by ensuring that the key is in the ignition barrel and turned to position I, depressing the two plastic clips and pulling the switch from the lock. Before replacing the ignition barrel, ensure that the switch is in position I (a new switch is supplied in position 0), and ensure that the drive tangs on the lock shaft are aligned with the alignment mark on the lock casting. Push the switch into the lock and ensure that it is fully engaged on the drive tangs and the plastic clips are fully located in the slots.

Steering Wheel Heating

Overview

The heated steering wheel is controlled by the driver using the switch on the steering wheel. The switch is either a dual function switch, or a separate switch depending on the feature level fitted.

Heated steering wheel switches



E103222

The heated steering wheel icon, in the switch, will illuminate as follows:

- If the steering wheel heating is on, the icon will show amber.
- If the steering wheel heating and headlamps are off, the icon will not illuminate.
- If the steering wheel heating is off and headlamps are on, the icon will show green.

5	-	Clockspring
6	-	Steering wheel heater module
7	-	Steering wheel heater element
8	-	Steering wheel heat sensor
9	-	Steering wheel heater switches

A non-serviceable heater element is incorporated in the steering wheel which provides a uniform distribution of heat throughout the rim of the steering wheel. A heat sensor also located in the rim of the steering wheel is monitored by the steering wheel heater module located under the steering wheel's right-hand switch pack.

The heater element is activated when the driver operates the switch on the steering wheel. The switch provides an input to the steering wheel heater module, which responds by supplying an output signal to the heater element. The heater module, via signals from the heat sensor, controls the operation of the heater element to maintain a steering wheel surface temperature of approximately 30°C (86°F).

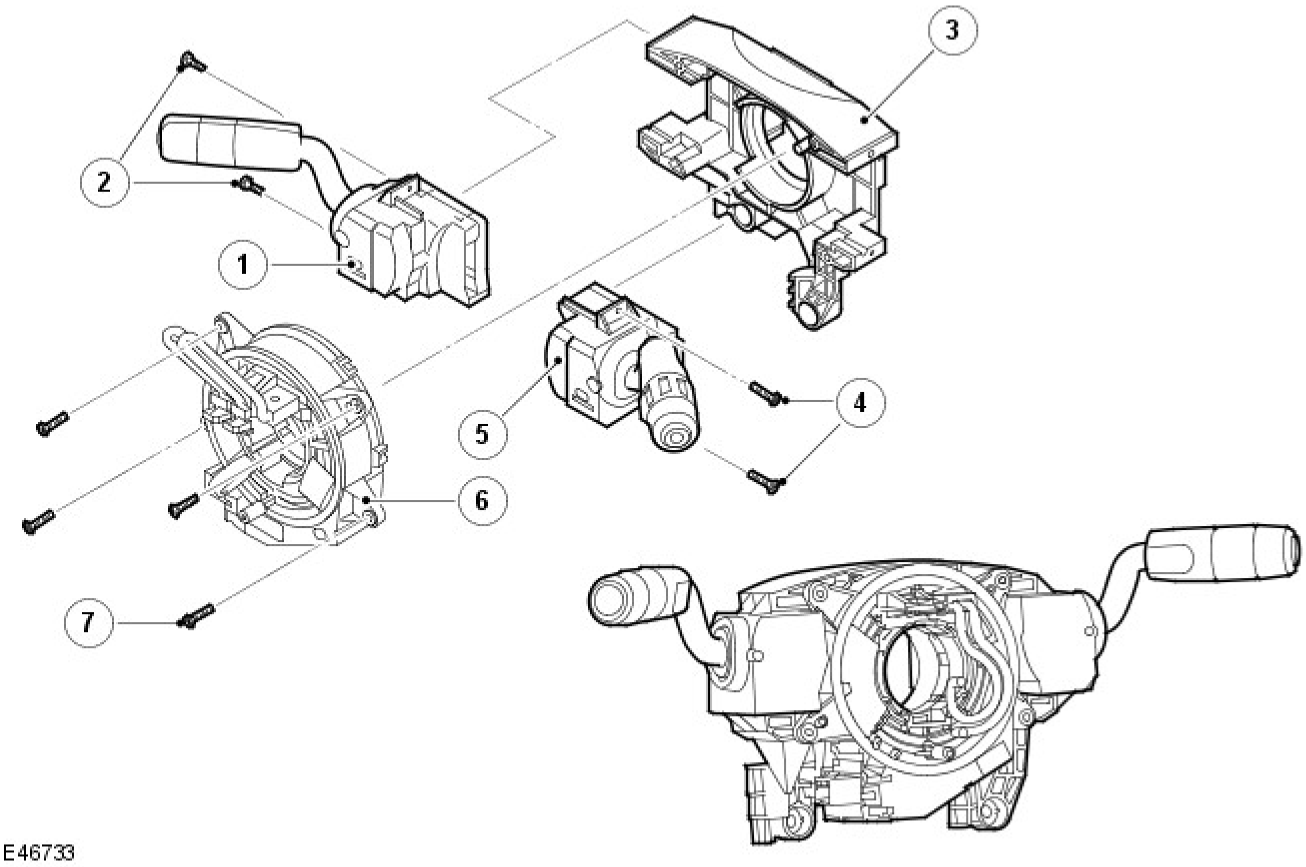
Steering Column Switches - Steering Column Switches

Description and Operation

The steering column switches comprise the steering column multifunction switch and the ignition switch. Both switches are located on the steering column assembly.

STEERING COLUMN MULTIFUNCTION SWITCH

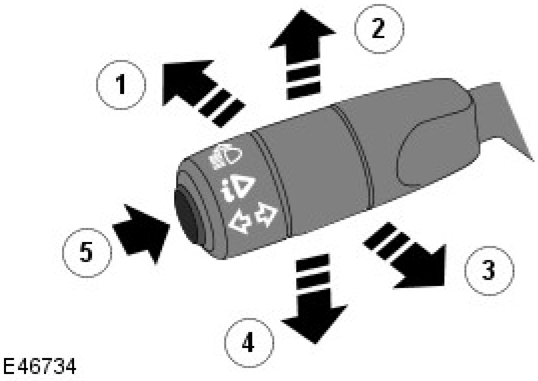


Item	Part Number	Description
1	-	Turn signal indicator switch assembly
2	-	Screw (2 off)
3	-	Case
4	-	Screw (2 off)
5	-	Windshield wiper switch assembly
6	-	Clockspring
7	-	Screw (4 off)

The steering column multifunction switch comprises a case which houses a turn signal indicator switch assembly, a windshield wiper switch assembly and a clockspring. The multifunction switch is located behind the steering wheel and is secured with two screws at the top to the steering column assembly and two screws at the bottom to the column lock housing.

The clockspring is located in the front of the case and retained with four screws. The clockspring engages in slots in the steering wheel boss and turns with the rotation of the steering wheel. The clockspring incorporates a tang which cancels the turn signal indicators when the steering wheel is rotated.
For additional information, refer to: Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) (501-20B Supplemental Restraint System, Description and Operation).

Turn Signal Indicator Switch Assembly



Item	Part Number	Description
1	-	High beam
2	-	Right hand indicator
3	-	Headlamp flash
4	-	Left hand indicator
5	-	Computer function button

The turn signal indicator switch assembly is located in the left hand side of the case and is retained in the case with two screws. The switch is connected to the main harness via a connector on the back of the switch. The switch controls the following functions:

- Left / right turn signal operation
- High / low beam operation
- Headlamp flash
- Computer function selection (if fitted).

Turn Signal Indicators

The turn signal indicators are operated by pushing the switch up for right hand indicators and down for left hand indicators. The switch has a detent position which locks the switch in the selected position until it is moved to the central off position. The switch also has a 'lane change' function which allows the switch to be operated without moving through the detent for use when changing lane on motorways or when overtaking. When released from the 'lane change' position, the switch is automatically returned to the central off position. The left and right hand turn signal indicator switch positions are connected on separate wires to the Central Junction Box (CJB) and the switch. When a switch position selection is made, a circuit is completed from the CJB to ground, via the selected switch position. The CJB detects the completed circuit and operates the selected turn signal indicator until the switch is moved to the central off position. The turn signal indicators can be cancelled either manually by the driver or automatically when the steering wheel is rotated to the straight ahead position.

High/Low Beam and Headlamp Flash

High beam is operated by pushing the switch forwards. The switch is latched in this position and the high beam is active until the switch is manually pulled rearwards. The headlamp flash function is operated by pulling the switch rearwards. The switch contacts complete a circuit and the headlamps are activated for as long as the switch is operated. The switch is non-latching in this position and the headlamp flash is switched off when the switch is released and it returns to its off position. The high beam and headlamp flash positions are connected on separate wires to the CJB and ground. When a switch selection is made, a circuit is completed from the CJB to ground via the switch contacts.

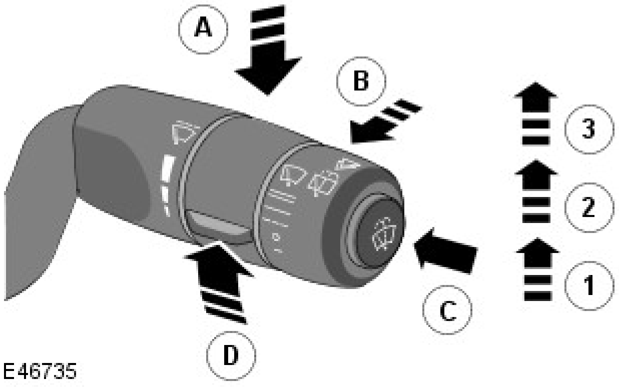
Computer Function Button

The computer function button is located on the end of the switch stalk. The button is a momentary switch and allows the driver to select the following information in the instrument cluster message center:

- Trip distance
- Distance on fuel remaining in the fuel tank
- Fuel tank remaining quantity
- Average fuel consumption
- Vehicle life fuel consumption
- Average speed
- Instantaneous fuel consumption.

The button is connected to the instrument cluster and ground. When the button is pressed the circuit is completed and the instrument cluster displays the next trip computer information. Repeated presses of the button selects each display in the message center in turn.
For additional information, refer to: Information and Message Center (413-08 Information and Message Center, Description and Operation).

Windshield Wiper Switch Assembly



Item	Part Number	Description
1	-	Intermittent position
2	-	Slow speed
3	-	Fast speed
A	-	Flick wipe
B	-	Rear wash/wipe
C	-	Wash wipe
D	-	Intermittent delay (6 positions)

The windshield wiper switch assembly is located on the right hand side of the case and is retained in the case with two screws. The switch is connected to the main harness via a connector at the back of the switch. The switch controls the following functions:

- Windshield wiper intermittent, slow and fast speed
- Windshield wiper flick wipe
- Windshield wash/wipe
- Rear wash/wipe
- Intermittent delay selection.

For additional information, refer to: Wipers and Washers (501-16 Wipers and Washers, Description and Operation).

Windshield Wiper Switch Operation

The windshield wiper functions are operated by moving the switch up or down. Flick wipe is selected by pushing the switch down. The switch is non-latching in this position and wiper operation is stopped when the switch is released and it returns to the off position. The flick wipe switch contact is connected on a single wire to the CJB and ground. This is the same connection to the CJB as the fast speed wipe. When the switch is operated the circuit is completed between the CJB and ground. The CJB detects the completed circuit and operates the wipers for as long as the switch contact is made.

Intermittent is selected by pushing the wiper switch up, to the detent position, the wipers operate at the delay period selected on the rotary switch on the wiper stalk. The wipers remain in the intermittent mode until the wiper switch is moved to the off or slow/fast speed positions. The intermittent switch contact is connected between the CJB and ground. When the switch is moved to the intermittent position the circuit is completed. The CJB detects the completed circuit and operates the wipers in the intermittent delay selected for as long as the switch contact is made.

The intermittent delay period is selected using a rotary control on the wiper switch stalk. The rotary control allows the driver to select six delay periods to suit the prevailing weather conditions. The rotary control is connected on three wires to the CJB and a single wire to ground. The six positions each use a different combination of the three wires. The CJB detects, via the three wires, which selection has been made and operates the wipers with the appropriate delay.

Slow speed operation is selected by pushing the wiper switch up, to the second detent position. The wipers operate at slow speed until the wiper switch is moved to the off, intermittent or fast speed positions. The slow speed switch contact is connected between the CJB and ground. When the switch is moved to the slow speed position the circuit is completed. The CJB detects the completed circuit and operates the wipers at slow speed for as long as the switch contact is made.

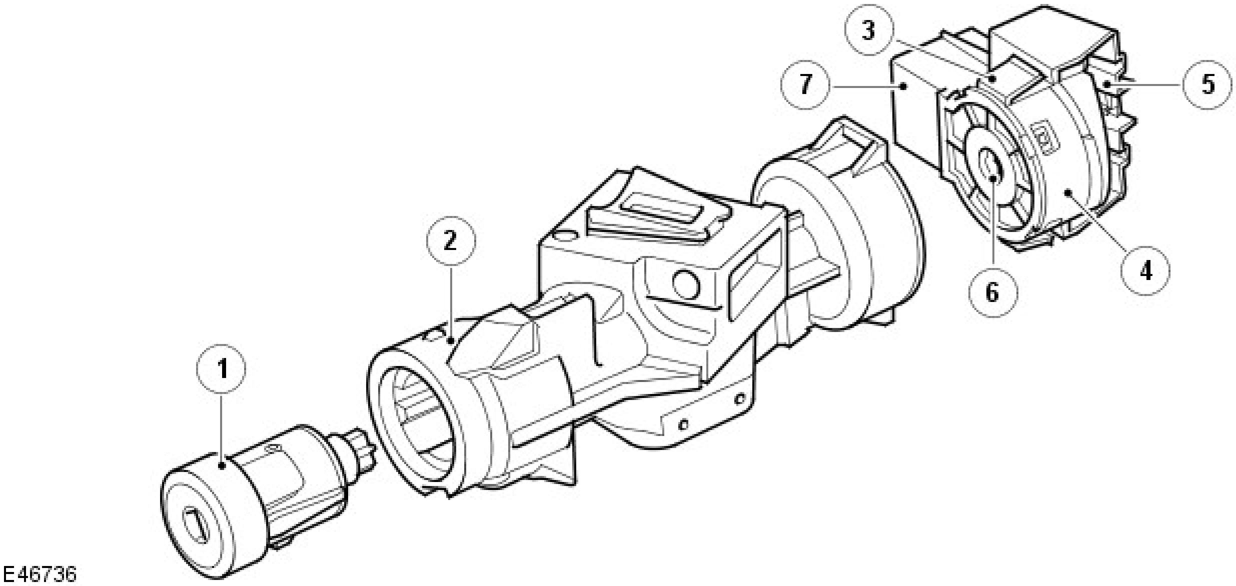
Fast speed operation is selected by pushing the wiper switch up, to the third detent position. The wipers operate at fast speed until the wiper switch is moved to the off, intermittent or slow speed positions. The fast speed switch contact is connected between the CJB and ground. When the switch is moved to the fast speed position the circuit is completed. The CJB detects the completed circuit and operates the wipers at fast speed for as long as the switch contact is made.

Rear Wash/Wipe Switch Operation

The rear wash/wipe functions are operated by moving the switch rearwards. Rear wipe is selected by moving the wiper switch rearwards to the first detent position. The rear wiper switch is connected between the CJB and ground. When the switch is moved to the rear wiper position the circuit is completed. The CJB detects the completed circuit and operates the rear wiper for as long as the switch contact is made.

The rear washer is selected by moving the wiper switch rearwards to the second, non-latching position. When the switch is moved to this position a circuit is completed between the CJB and ground. The CJB detects the completed circuit and operates the rear washer for as long as the switch contact is made.

IGNITION SWITCH



Item	Part Number	Description
1	-	Key barrel
2	-	Column lock
3	-	Locking tab
4	-	Ignition switch
5	-	Harness connector
6	-	Drive shaft location
7	-	Key interlock solenoid

The ignition switch is located in the left hand end of the steering column lock assembly. The switch is held in the column lock casting with two locking tabs which engage in slots in the column lock casting.

The switch has a slot which provides for the location of the drive shaft which passes through the column lock. This shaft is rotated by the driver when the ignition key is turned in the key barrel. This rotation turns a drum inside the ignition switch which moves two electrical contacts to select the required ignition position. A spring loaded ball locates in a seat for each of the three ignition switch positions, allowing the driver to feel when the required position is reached.

On vehicles with automatic transmission. a solenoid is located on the side of the ignition switch. The solenoid, which is controlled on a single wire from the transfer box control module, prevents the key from being removed from the key barrel if the transmission selector lever is not in the PARK (P) position. The transfer box receives the transmission position status via a message transmitted from the transmission control module on the CAN bus.

The solenoid, when energised, moves a pin which prevents the ignition switch returning fully to the '0' off position. This prevents the key being removed until the transmission is in the PARK position.

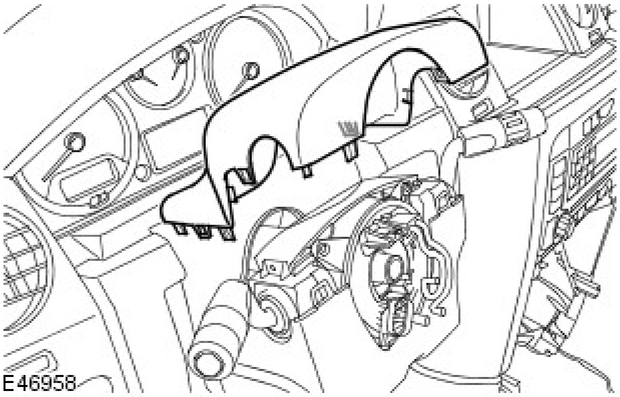
Removal and Installation

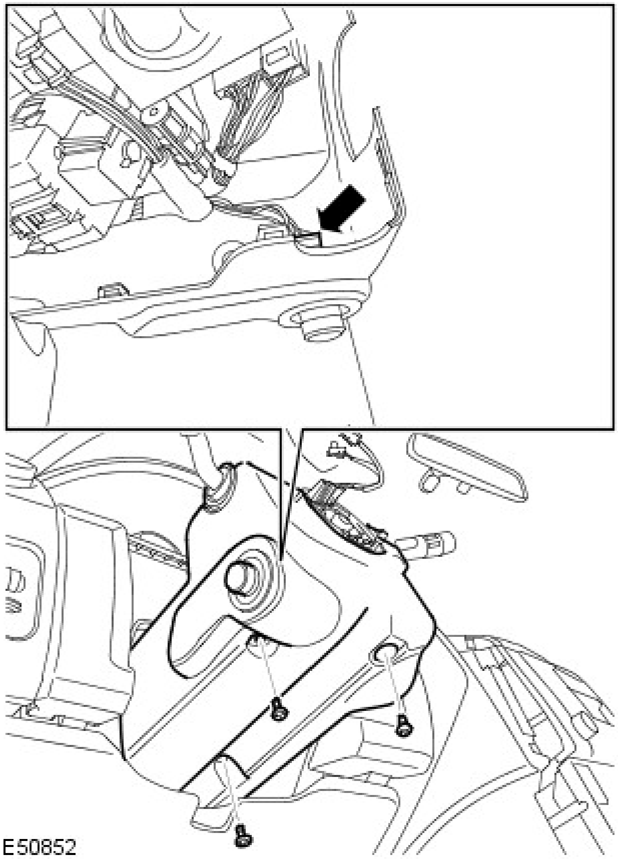
Removal

⚠CAUTION: If the ignition lock cylinder and switch are both removed from the ignition switch assembly, the assembly shaft MUST NOT be rotated. Failure to comply will cause the incorrect operation of the lock, and the assembly must be replaced.

1. Fully extend the steering column for access.
2. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
3. Remove the steering wheel.
   For additional information, refer to: Steering Wheel (211-04 Steering Column, Removal and Installation).

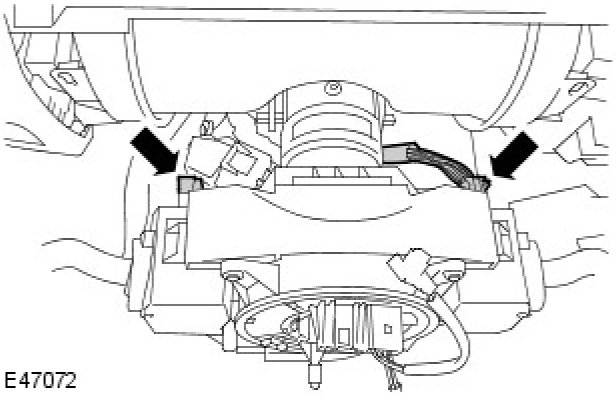


4. Remove the steering column upper shroud.
   - Release the 6 clips.

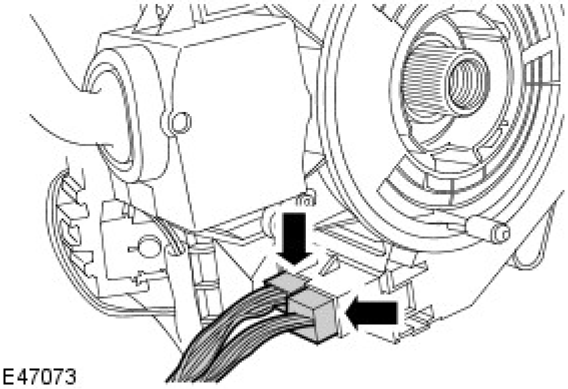


5. Remove the steering column lower shroud.

- Remove the 3 Torx screws.
- Disconnect the electrical connector.



6. Disconnect the 2 electrical connectors from the steering column multifunction switches.



7. Disconnect the 2 electrical connectors from the clockspring.

8. Remove the steering column switch assembly.

- Remove the 4 Torx bolts.

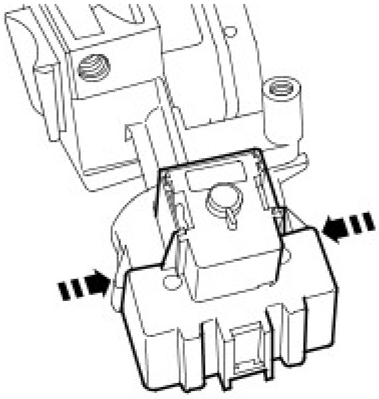
11. ⚠ CAUTION: If the ignition lock cylinder and switch are both removed from the ignition switch assembly, the assembly shaft MUST NOT be rotated. Failure to comply will cause the incorrect operation of the lock, and the assembly must be replaced.

• NOTE: Do not disassemble further if the component is removed for access only.

Remove the ignition lock cylinder.

- Turn the ignition key to position 1.
- Insert a pin, not exceeding 2 mm diameter, through the access hole in the ignition lock cylinder housing to depress the plunger, and release the ignition lock cylinder.



E51364

12. Remove the ignition switch.

- Depress the 2 clips.

Installation

1. Install the ignition switch.

- Secure with the clips.

2. Install the ignition lock cylinder.

- Turn the ignition key to position 1.
- Locate into guides and depress the plunger.

3. Install the passive coil.

- Secure the clips.
- Connect the electrical connector.

4. Install the ignition switch assembly.

- Tighten the shear bolts until the heads shear off.
- Connect the electrical connector.

5. Install the steering column switch assembly.

- Tighten the Torx bolts to 3 Nm (2 lb.ft).

6. Connect the clockspring and multifunction switch electrical connectors.

7. Install the steering column shrouds.

- Connect the electrical connector.
- Tighten the Torx screws.
- Secure the clips.

8. Install the steering wheel.
For additional information, refer to: Steering Wheel (211-04 Steering Column, Removal and Installation).

Diagnosis and Testing

Overview

As diagnosis of the different areas of the engine is covered in other sections and by general procedures, this section is limited to a compression and an oil pressure test.

For specific areas of the engine, refer to the general procedures in this section and the relevant section of the manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical faults.

Symptom chart

Mechanical
• Engine oil level • Coolant level • Transmission fluid level • Fuel level • Coolant leaks • Oil leaks • Fuel leaks • Visibly damaged or worn parts • Loose or missing nuts or bolts • Fuel contamination/grade/quality • Sensor fitment/condition • Viscous fan and solenoid

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before carrying out the following procedures.
    - Make sure that all DTCs are cleared following rectification.

Compression test

WARNING: Make sure the parking brake is applied and the gear selector is in neutral (or park for vehicles with automatic transmission) before beginning this procedure. Failure to follow this instruction may result in personal injury.

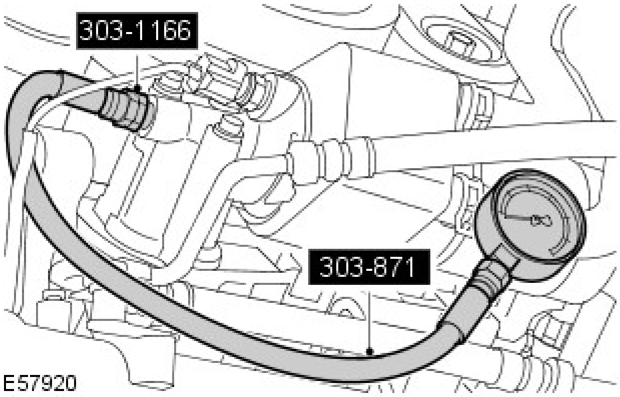
1. **1.** Remove the fuel pump relay.
2. **2.** Start the engine and allow to idle.
    - The engine will run for a few seconds then stall
3. **3.** Remove the spark plugs.
   REFER to: Spark Plugs (303-07B Engine Ignition - V8 4.4L Petrol, Removal and Installation).
4. **4.** Install a compression tester.
5. **5.** Hold the accelerator pedal to the floor and crank the engine a minimum of five and a maximum of ten engine revolutions and record the reading.
6. **6.** Repeat the test on each cylinder, cranking the engine approximately the same number of compression strokes.
    - A reliable indicator of a problem is one cylinder reading lower than the others, rather than a minimum figure for all cylinders
7. **7.** Install the components in reverse order, observing the specified tightening torques.
8. **8.** Check and clear any DTCs.

Oil Pressure check

WARNING: The spilling of hot engine oil is unavoidable during this procedure, care must be taken to prevent scalding. Failure to follow this instruction may result in personal injury.

• NOTE: Before checking the oil pressure, carry out a 6 mile (10 kilometer) road test. Do not attempt to achieve normal operating temperature by allowing the engine to idle.

1. **1.** Remove the engine oil pressure sensor.
   REFER to: Engine Oil Pressure (EOP) Sensor (303-14B Electronic Engine Controls - V8 4.4L Petrol, Removal and Installation).
2. **2.** Install the special tool to the oil filter housing.
3. **3.** Install the special tool gauge and tighten the union.



4. **4.** Check and top-up the engine oil, if required.
5. **5.** Start and run the engine.
6. **6.** Note the oil pressure readings with the engine at idle and at 3,500 rpm.
   REFER to: Specifications (303-01B Engine - V8 4.4L Petrol, Specifications).

General Procedures

VUJ0001696

1. NOTE: Make sure that the following stages are followed exactly. The tappets or followers must be removed to carry out this measurement.

• NOTE: Make sure that the camshaft is to specification.

• NOTE: The bearing caps and journals should be free from engine oil and dirt.

Position on a length of plastigage on the bearing cap.

- Insert the camshaft, without lubrication, into the cylinder head.
- Position a plastigage strip, which should be equal to the width of the bearing cap, on the bearing journal.

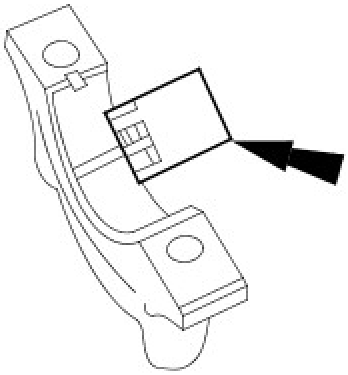
2. Install the camshaft bearing caps.

- Follow the relevant tightening sequence.

3. NOTE: Do not strike the bearing caps.

Remove the camshaft bearing caps.

- Follow the relevant loosening sequence.



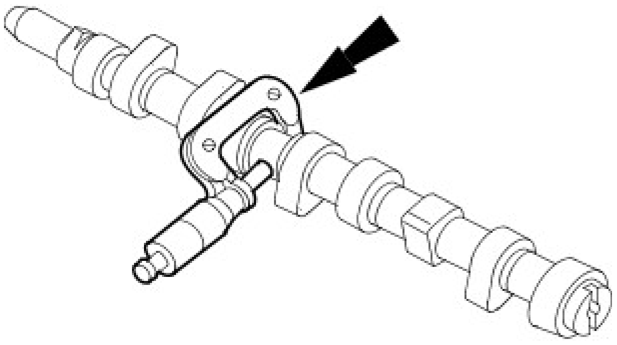
VUJ0001697

4. Using the special tool, read off the measurement.

- Compare the width of plastigage with the plastigage scale.
- The value that is read off is the bearing clearance.
- If the values are not to specification install a new camshaft.

Engine System - General Information - Camshaft Bearing Journal Diameter

General Procedures



VUJ0001695

1. Determine the diameter of the camshaft journals.
    - Using a micrometer measure the diameter at 90 degrees intervals to determine if the journals are out-of-round.
    - Measure at two different points on the journal to determine if there is any tapering.
    - If the measurements are out of the specified range, install a new camshaft.

Engine System - General Information - Crankshaft Main Bearing Journal Clearance

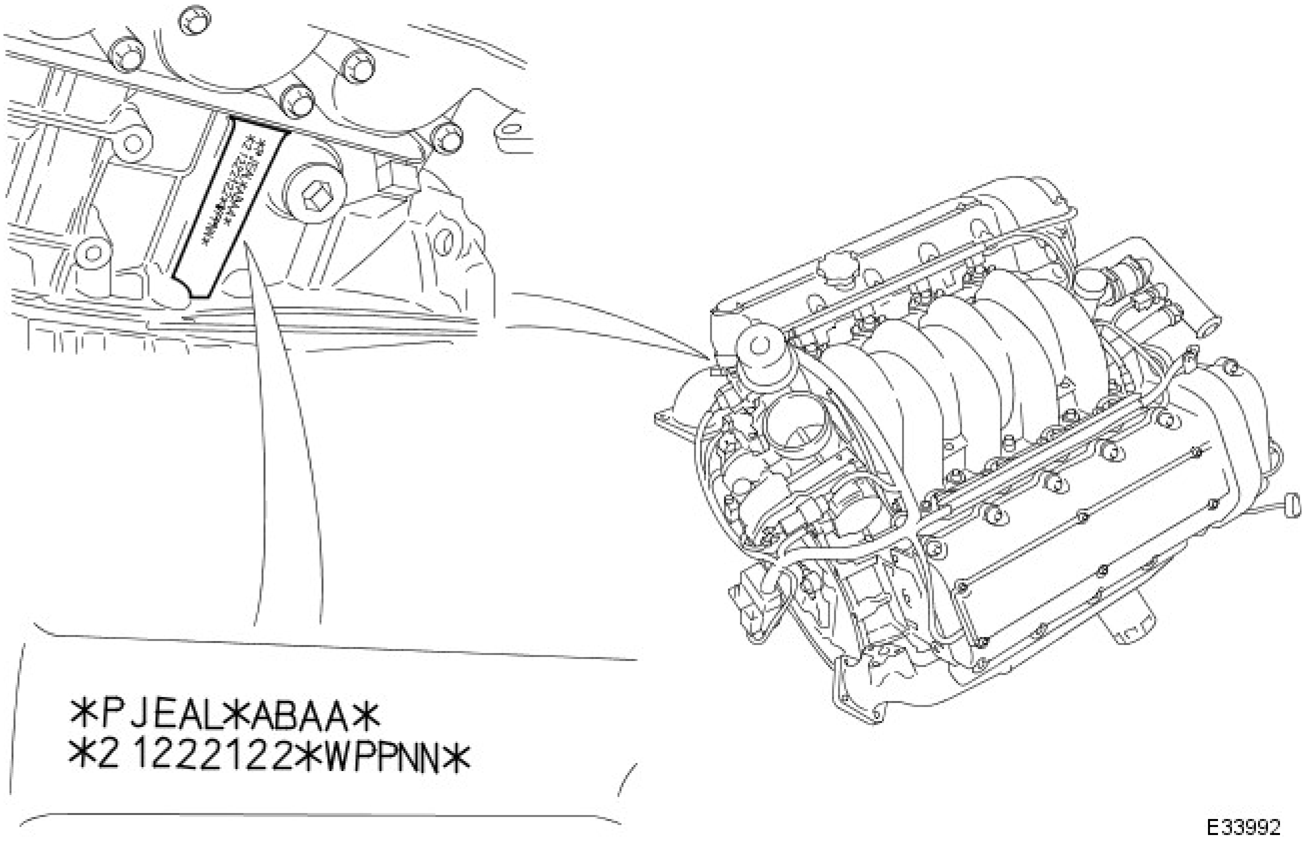
General Procedures

CAUTION: **THESES PROCEDURES SHOULD NOT BE CARRIED OUT DURING THE MANUFACTURERS WARRANTY PERIOD.**

1. NOTE: **Example - *PJEAL* - Crankshaft Main Journal Diameter.**

Read the grade letters from LEFT to RIGHT = FRONT to REAR of engine eg. for this example engine, the crank journal at the front of the engine is grade P, and at the rear is grade L.

- The selection of main bearing shells is described in the following chart.



2. NOTE: **Example - *ABAA* - Crankshaft (Big End Bearing) Crankpin Diameter**

• NOTE: **For vehicles built up to 2002 MY.**

• NOTE: **If the crankshaft main bearing carrier retaining bolts have been marked with a center punch dot, they must be discarded and new bolts installed.**

Read the grade letters from LEFT to RIGHT = FRONT to REAR of engine eg. for this example engine, the crankpin at the front of the engine is grade A and at the rear is also grade A.

- Grade A = 56,000 to 55,994 mm (Bearing Shell Color Code - Blue).
- Grade B = 55,994 to 55,988 mm (Bearing Shell Color Code - Green).

- Grade C = 55,988 to 55,982 mm (Bearing Shell Color Code - Yellow).

3. NOTE: **Example - *ABAA* - Crankshaft (Big End Bearing) Crankpin Diameter**

• NOTE: **For vehicles built from 2002 MY.**

• NOTE: **If the crankshaft main bearing carrier retaining bolts have been marked with a center punch dot, they must be discarded and new bolts installed.**

Read the grade letters from LEFT to RIGHT = FRONT to REAR of engine eg. for this example engine, the crankpin at the front of the engine is grade A and at the rear is also grade A.

- Grade A = 53,000 to 52,994 mm (Bearing Shell Color Code - Blue).
- Grade B = 52,994 to 52,988 mm (Bearing Shell Color Code - Green).
- Grade C = 52,988 to 52,982 mm (Bearing Shell Color Code - Yellow).

4. NOTE: **Example - *21222122* - Cylinder Bore and Piston**

The cylinder bore grades read from LEFT to RIGHT as follows:

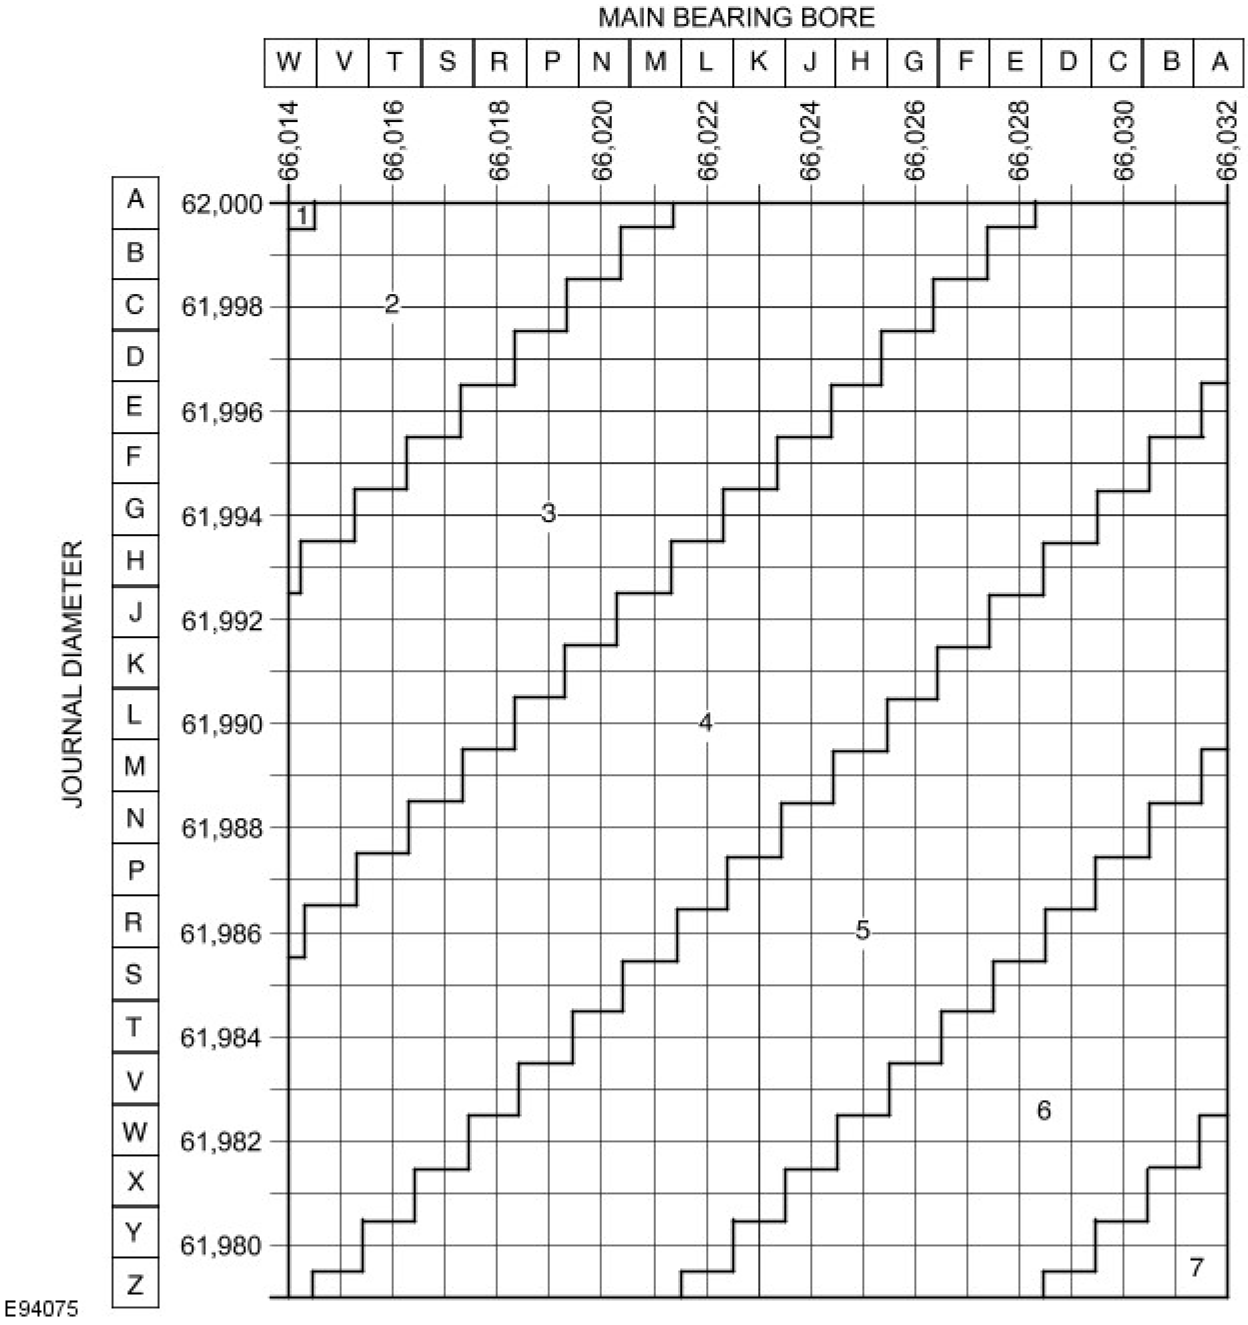
- Bank 2 - Cylinder 1, Bank 2 - Cylinder 2, Bank 2 - Cylinder 3, Bank 2 - Cylinder 4, Bank 1 - Cylinder 4,
- Bank 1 - Cylinder 3, Bank 1 - Cylinder 2, Bank 1 - Cylinder 1.
- **(Note, in earlier publications Bank 1 was described as A-Bank and Bank 2 as B-Bank)**
- Grade 1 Bore = 85,990 to 86,000 mm.
- Grade 2 Bore = 86,000 to 86,010 mm.
- Grade 3 Bore = 86,010 to 86,020 mm.

5. NOTE: **Example - *WPPNN* - Crankshaft Main Bearing Bore in Cylinder Block**

Read the grade letters from LEFT to RIGHT = FRONT to REAR of engine eg. for this example engine, the crank journal bore at the front of the engine is grade W, and at the rear is grade N.

- The selection of main bearing shells is described in the following **JOURNAL DIAMETER AND MAIN BEARING BORE CHART**.

6. JOURNAL DIAMETER AND MAIN BEARING BORE CHART



7. NOTE: **THIS PROCEDURE SHOULD ONLY BE CARRIED OUT WHEN REPLACIING MAIN BEARING SHELLS.**

- NOTE: Refer to the **JOURNAL DIAMETER AND MAIN BEARING BORE CHART** in step 6 for tolerance and bearing information.

The number in each diagonal band represents a PAIR of color coded main bearing shells which must be used with a specific journal, depending on the combination of journal diameter and crankshaft bore diameter. The color codes for each band are as follows:

1. **Blue / Green and Blue / Green**
2. **Blue / Green and Blue**
3. **Blue and Blue**
4. **Blue and Green**
5. **Green and Green**

6. **Green and Yellow**

7. **Yellow and Yellow**

- Consider crankshaft journal 5 (from the example grade markings on the cylinder block) - the cylinder block bore is Grade N and the crankshaft journal diameter is Grade L. From the chart, it will be seen that the point of intersection is in Band 4 which equates to one Blue shell and one Green shell.
- When the appropriate pair of color codes have been selected for a journal, either color may be installed to the cylinder block or to the bedplate, but, the shell which is to be installed to the cylinder block must have an oil groove and the shell which is to be installed to the bedplate must be plain.

8. NOTE: **THIS PROCEDURE SHOULD ONLY BE CARRIED OUT WHEN A REPLACMENT CRANKSHAFT OR CYLINDER BLOCK HAS BEEN FITTED.**

• NOTE: Refer to the **JOURNAL DIAMETER AND MAIN BEARING BORE CHART** in step 6 for tolerance and bearing information.

The thickness grade of all main bearing shells are to be selected to give a total running clearance of not less than 0.022 mm or greater than 0.040 mm.

- Each bearing bore in the block/bedplate assembly should be measured at two mutually perpendicular diameters 45° to the vertical in the middle of the bearing.
- The minimum diameter of the two is to be used.
- Each crankshaft main bearing journal should be measured dynamically at a point in line with the middle of each bearing.
- When the appropriate pair of color codes have been selected for a journal, either color may be installed to the cylinder block or to the bedplate, but, the shell which is to be installed to the cylinder block must have an oil groove and the shell which is to be installed to the bedplate must be plain.

Oil Pressure check

- WARNINGS:

⚠ The spilling of hot engine oil is unavoidable during this procedure, care must be taken to prevent scalding.

⚠ Wear protective gloves.

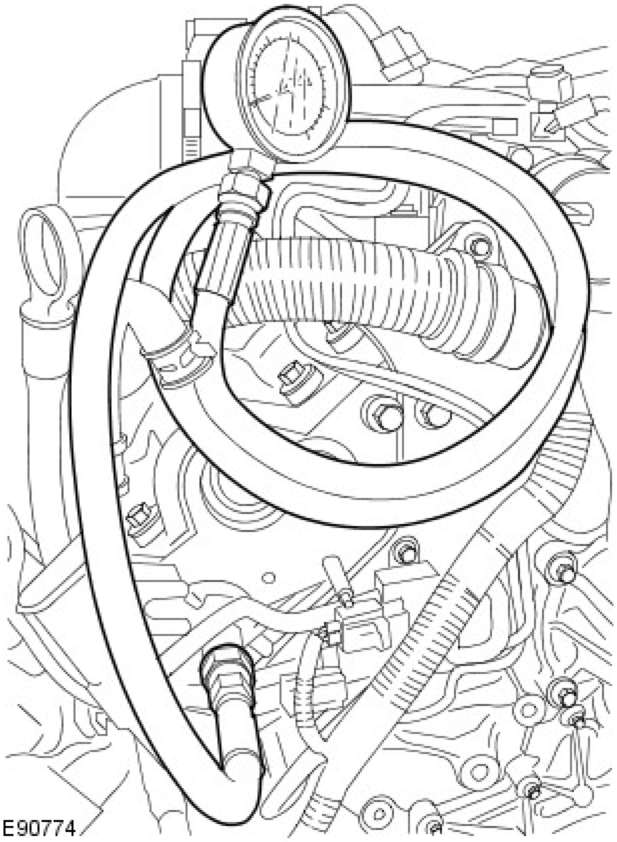
⚠ Eye protection must be worn.

• NOTE: Prior to checking the engine oil pressure, a road test of 6 miles (10 kilometers), must be carried out. Do not attempt to attain engine normal operating temperature by allowing the engine to idle.

1. **1.** Disconnect the battery ground cable.
   REFER to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. **2.** Remove the engine oil pressure (EOP) sensor.
   REFER to: Engine Oil Pressure (EOP) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation).

3. **3.** Install the special tools.



4. ⚠ CAUTION: Make sure that the mating faces are clean and free of foreign material.

   4. Install the brake vacuum pump.
   REFER to: Brake Vacuum Pump - TDV8 3.6L Diesel (206-07 Power Brake Actuation, Removal and Installation).

5. **5.** Check and top-up the engine oil, if required.

6. **6.** Start and run the engine.

7. **7.** Note the oil pressure readings with the engine running at idle and 3500 RPM.
   REFER to: Specifications (303-01D Engine - TDV8 3.6L Diesel, Specifications).

8. **8.** Turn off the engine.

9. **9.** Remove the brake vacuum pump.
   REFER to: Brake Vacuum Pump - TDV8 3.6L Diesel (206-07 Power Brake Actuation, Removal and Installation).

10. **10.** Remove the special tools.

11. **11.** Install the oil pressure sensor.

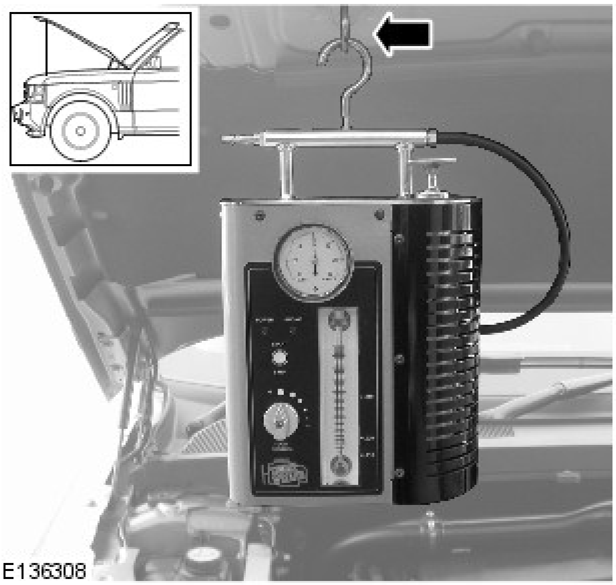
Engine System - General Information - Leakage Test Using Smoke Test Equipment

General Procedures

⚠CAUTION: The compressed air line supply pressure must be between 3.5 and 12 bar (50 and 175 psi) for the smoke test equipment to function correctly. Do not exceed this pressure. Failure to follow this instruction may result in damage to the smoke test equipment.

- NOTE: The vehicle battery must be in good condition and fully charged before carrying out this procedure.
- NOTE: On vehicles with 3.0L TDV6, it will be necessary to insert smoke at both air cleaner outlet pipes independently if the right hand turbocharger and associated hoses are to be tested.
- NOTE: In some cases it may be necessary to remove undertrays, trim or engine covers to obtain access to all potential leak locations.
- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.
- NOTE: For further information regarding operation of the test equipment refer to the manufacturers operators manual supplied with the kit.



1. ⚠WARNING: Use an additional support to prevent the hood from falling if the smoke test equipment is secured to the hood. Failure to follow this instruction may result in personal injury.

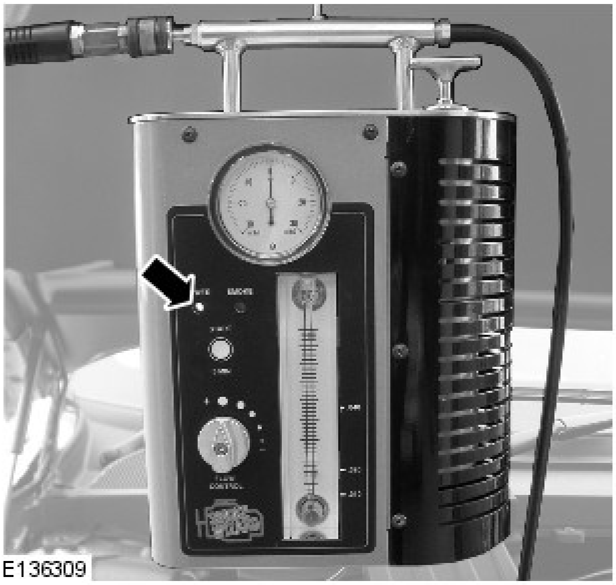
Install the smoke test equipment to a suitable location under the hood.

2. Connect a suitable compressed air line to the smoke test equipment.

3. Connect the smoke test equipment positive power cable to the battery positive terminal.

4. ⚠WARNING: Do not connect the smoke test equipment negative cable to the battery negative terminal.

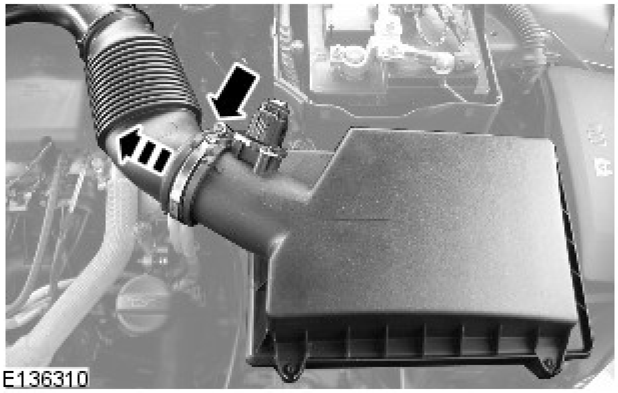
Connect the smoke test equipment negative cable to a suitable body ground point.



E136309

5. NOTE: A flashing green light indicates low battery voltage. In this case, place the battery on charge and make sure that the battery is fully charged before using the smoke test equipment.

Observe the power indicator lamp on the smoke test equipment. Make sure that a continuous green light is displayed.

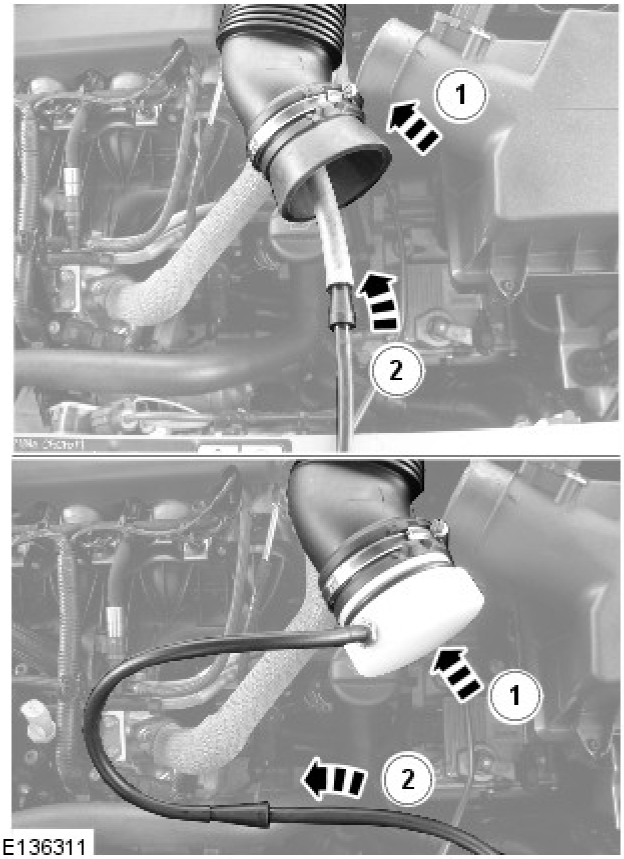


E136310

6. NOTE: In some cases it may be necessary to remove the air cleaner(s) to allow access to the air cleaner outlet pipes.

- NOTE: In some cases it will be necessary to cap one of the air cleaner outlet pipes. Use the blanking caps supplied in the kit to cap the open orifice.

Disconnect the air cleaner outlet pipe(s).

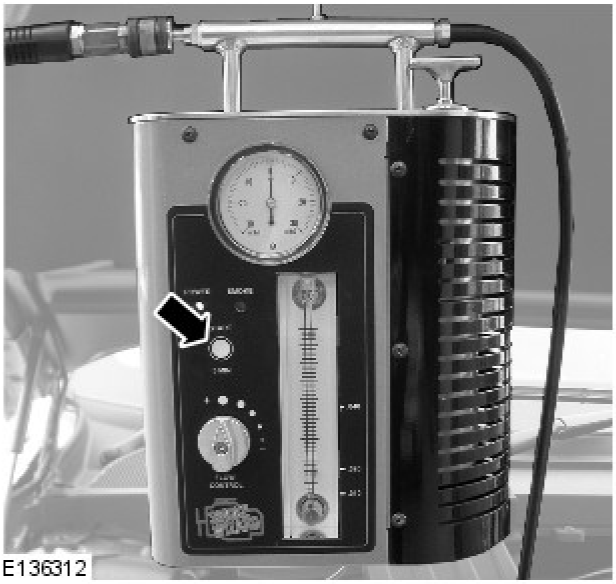


E136311

7. NOTE: Make sure the smoke test equipment adapter is a good fit to the air cleaner outlet pipe. This must be an air tight seal.

Connect the smoke test equipment supply hose to the air cleaner outlet pipe.

1. Install the appropriate adapter to the air cleaner outlet pipe.
2. Connect the smoke test equipment supply hose to the adapter link hose.



E136312

8. NOTE: The flow control valve must be in the fully open position.

- NOTE: Smoke is produced for 5 minutes. The smoke test equipment will automatically switch off after this period of time.

Switch the smoke test equipment on.

9. Remove the oil filler cap, and observe until a constant flow of smoke is visible leaving the oil filler orifice. Install the oil filler cap.

10. NOTE: The longer smoke is allowed to exit from a leak, the more fluorescent dye will be deposited at a leak location.

Using the torch supplied in the kit set to white light, look for escaping smoke. Alternatively, use the ultraviolet light to look for fluorescent dye deposits at the source of a leak.

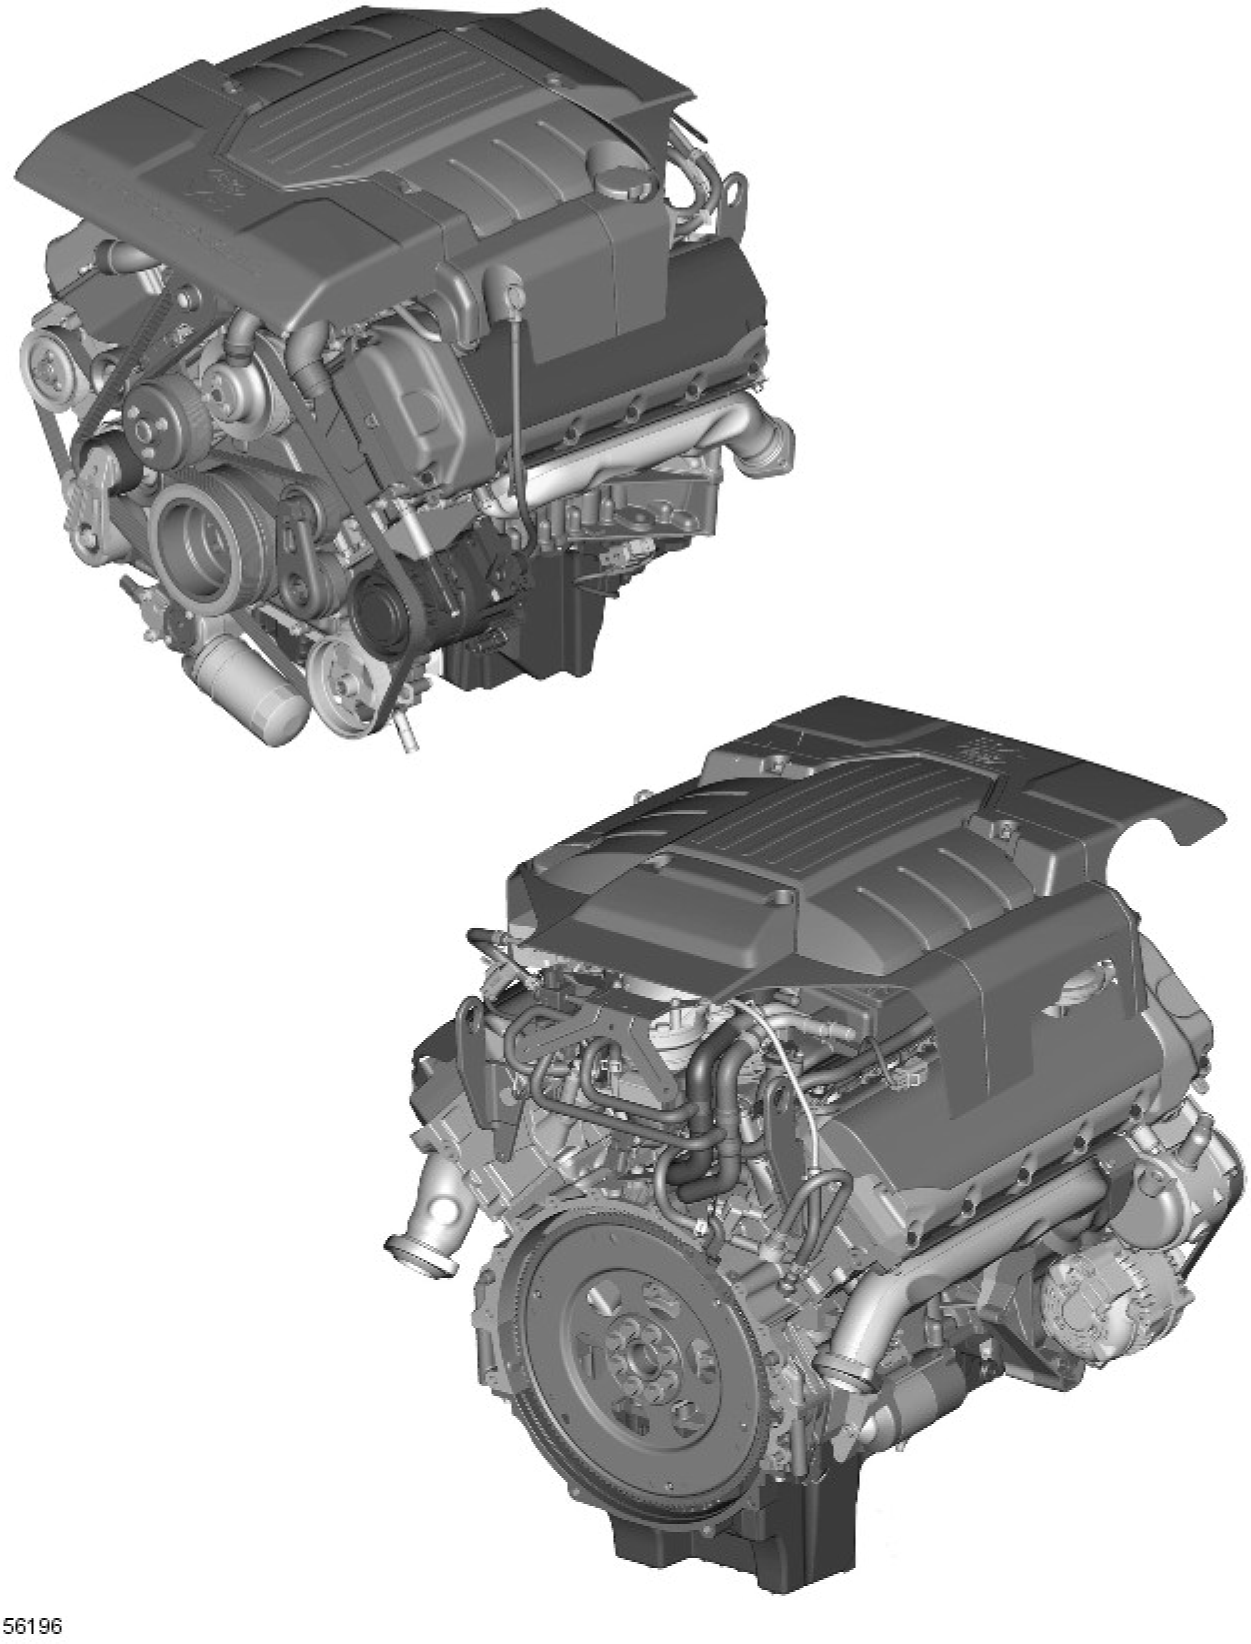
Engine - V8 S/C 4.2L Petrol - Engine

Description and Operation

External View



E56196

GENERAL

The V8 supercharged petrol engine is a 4.2 liter, 8 cylinder, 90 degrees 'Enclosed' V unit, with 4 valves per cylinder, operated by two overhead camshafts per cylinder head. The engine emissions comply with ECD3 (European Commission Directive) and US Federal Tier2 Bin 8 legislative requirements and employs catalytic converters, electronic engine management control and positive crankcase ventilation to limit the emission of pollutants. The cooling system is a low volume, high velocity system. The Engine Control Module (ECM) controls the fuel injection system, the ignition system and the electric throttle.

The cylinder block is of aluminum alloy construction with cast iron liners. A cast aluminum bedplate is bolted to the bottom of the block to improve lower structure rigidity. The cylinder heads are cast aluminum with thermo-plastic camshaft covers. The single-piece oil sump is also cast aluminum. The fabricated stainless steel twin skin exhaust manifolds are unique for each cylinder bank. A molded plastic acoustic cover is fitted over the upper engine to reduce engine-generated noise.

TECHNICAL FEATURES

The technical features include:

- An eight-cylinder 90-degree 'Enclosed V' configuration liquid cooled aluminum cylinder block with cast iron liners
- Pistons are of open-ended skirt design, with two compression rings and a three-piece oil control ring
- Two aluminum cylinder heads, each incorporating two camshafts manufactured in chilled cast iron
- Four valves per cylinder
- Graded valve lifters (shimless)
- Belt driven supercharger
- Top fed, 12-hole fuel injectors
- Engine front cover manufactured from aluminum, accommodating the crankshaft front oil seal
- Primary and secondary chain drive for the camshafts
- An aluminum bedplate
- A cast iron crankshaft

- Fracture-split connecting rods in sintered-forged steel
- A twin multi-vee belt, driving the front-end accessories
- Fabricated stainless steel twin skin exhaust manifolds
- An advanced engine management system incorporating electronic throttle control
- Meets with the fault handling requirements, as detailed in the European On-Board Diagnostic (EOBD) III, US Federal OBD and California OBDII legislation.

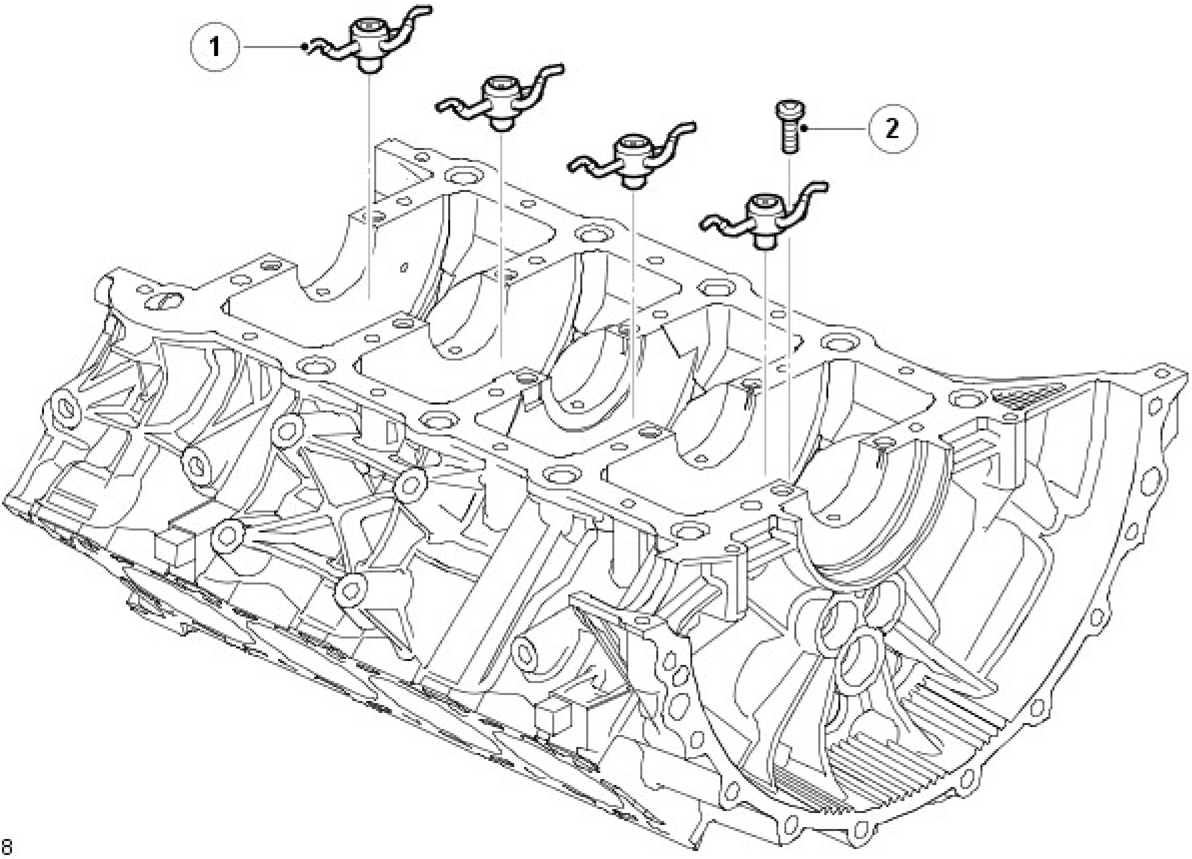
Cylinder Block

The cylinder block is an 'Enclosed V' design, which provides an inherently rigid structure with good vibration levels. A low volume coolant jacket improves warm-up times and piston noise levels; the longitudinal flow design of the jacket, with a single cylinder head coolant transfer port in each bank, improves rigidity and head gasket sealing. The right hand cylinder bank is designated as 'A' bank, and the left hand as 'B' bank.

Piston Cooling Jets



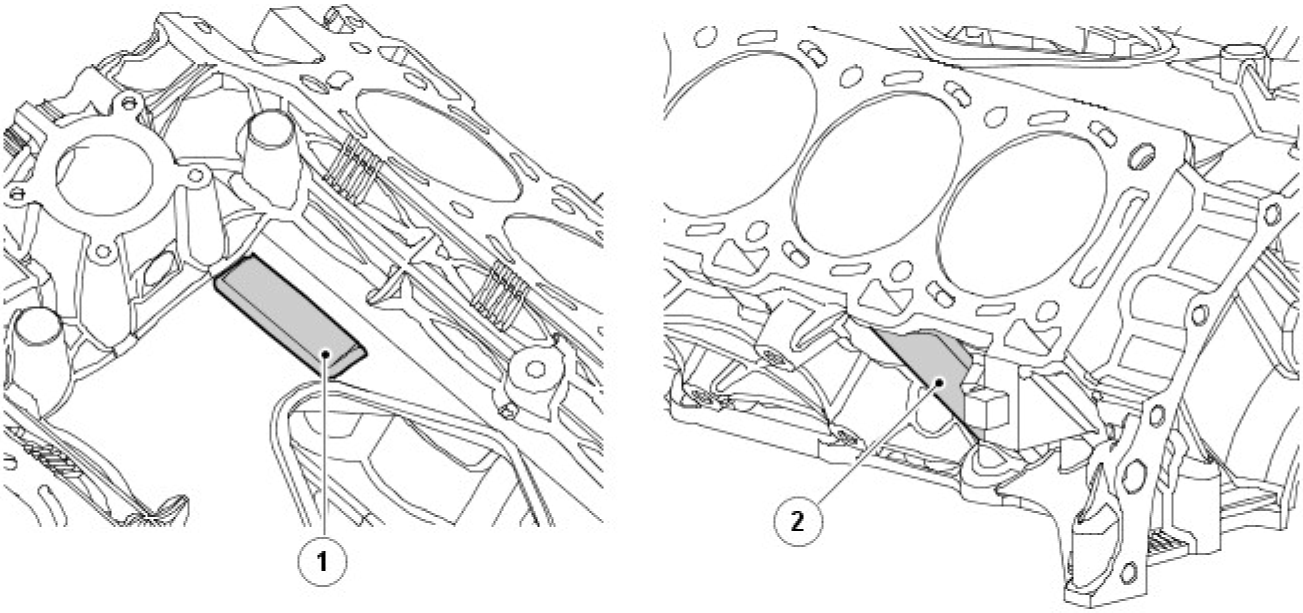
E56198

Item	Part Number	Description
1	-	Piston cooling jets
2	-	Bolt

Jets located in the cylinder block provide piston and gudgeon pin lubrication and cooling. These jets spray oil on the underside of the piston.

Lubrication oil is distributed through the cylinder block, via the main oil gallery and channels bored in the block, to all critical moving parts. These channels divert oil to the main and big-end bearings via holes machined into the crankshaft.

Engine Data Locations

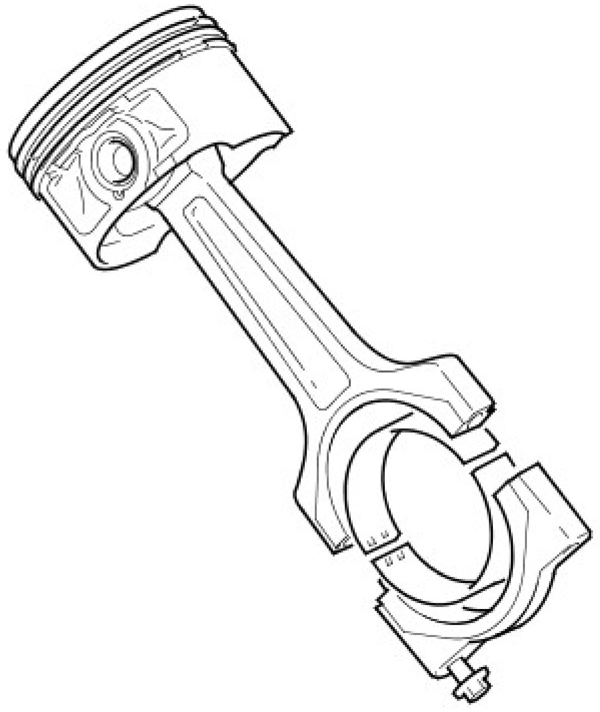


E43426

Item	Part Number	Description
1	-	Engine part number
2	-	Engine data (main bearing diameters, cylinder bore diameters, etc), emissions code and engine number

Engine data is marked at three locations, two on the cylinder block (shown) and one on the engine front cover, which consists a label displaying the engine number. Component diameters are represented by alphabetical and numerical codes; keys to the codes are in the Service Repair Procedures (SRP) Manual.

Connecting Rods and Pistons

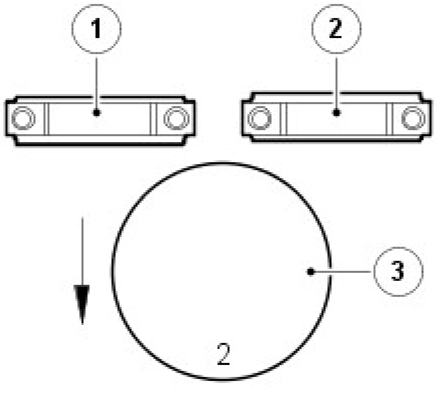


E43427

The connecting rods are manufactured from sinter-forged steel and have fracture-split bearing caps. The bearing caps are produced by fracturing the opposing sides of the connecting rod at the bearing horizontal center line. As well as being easier to manufacture, when reassembled the fractured surfaces interlock to form a strong seamless joint. The cylinder position is marked on adjoining sides of the joint to identify matching connecting rods and bearing caps. The connecting rod bearings are aluminum/tin split plain bearings.

The pistons are of the open-ended skirt design with a dished crown. They are also manufactured from a higher strength aluminum alloy and incorporate a thicker top land to resist the increased thermal and mechanical loads produced by supercharging. Three piston rings, two compression and one solid oil control ring, are installed on each piston. Each piston is installed on a gudgeon pin located in an bronze bushing in the connecting rod.

Connecting Rod and Piston Installation



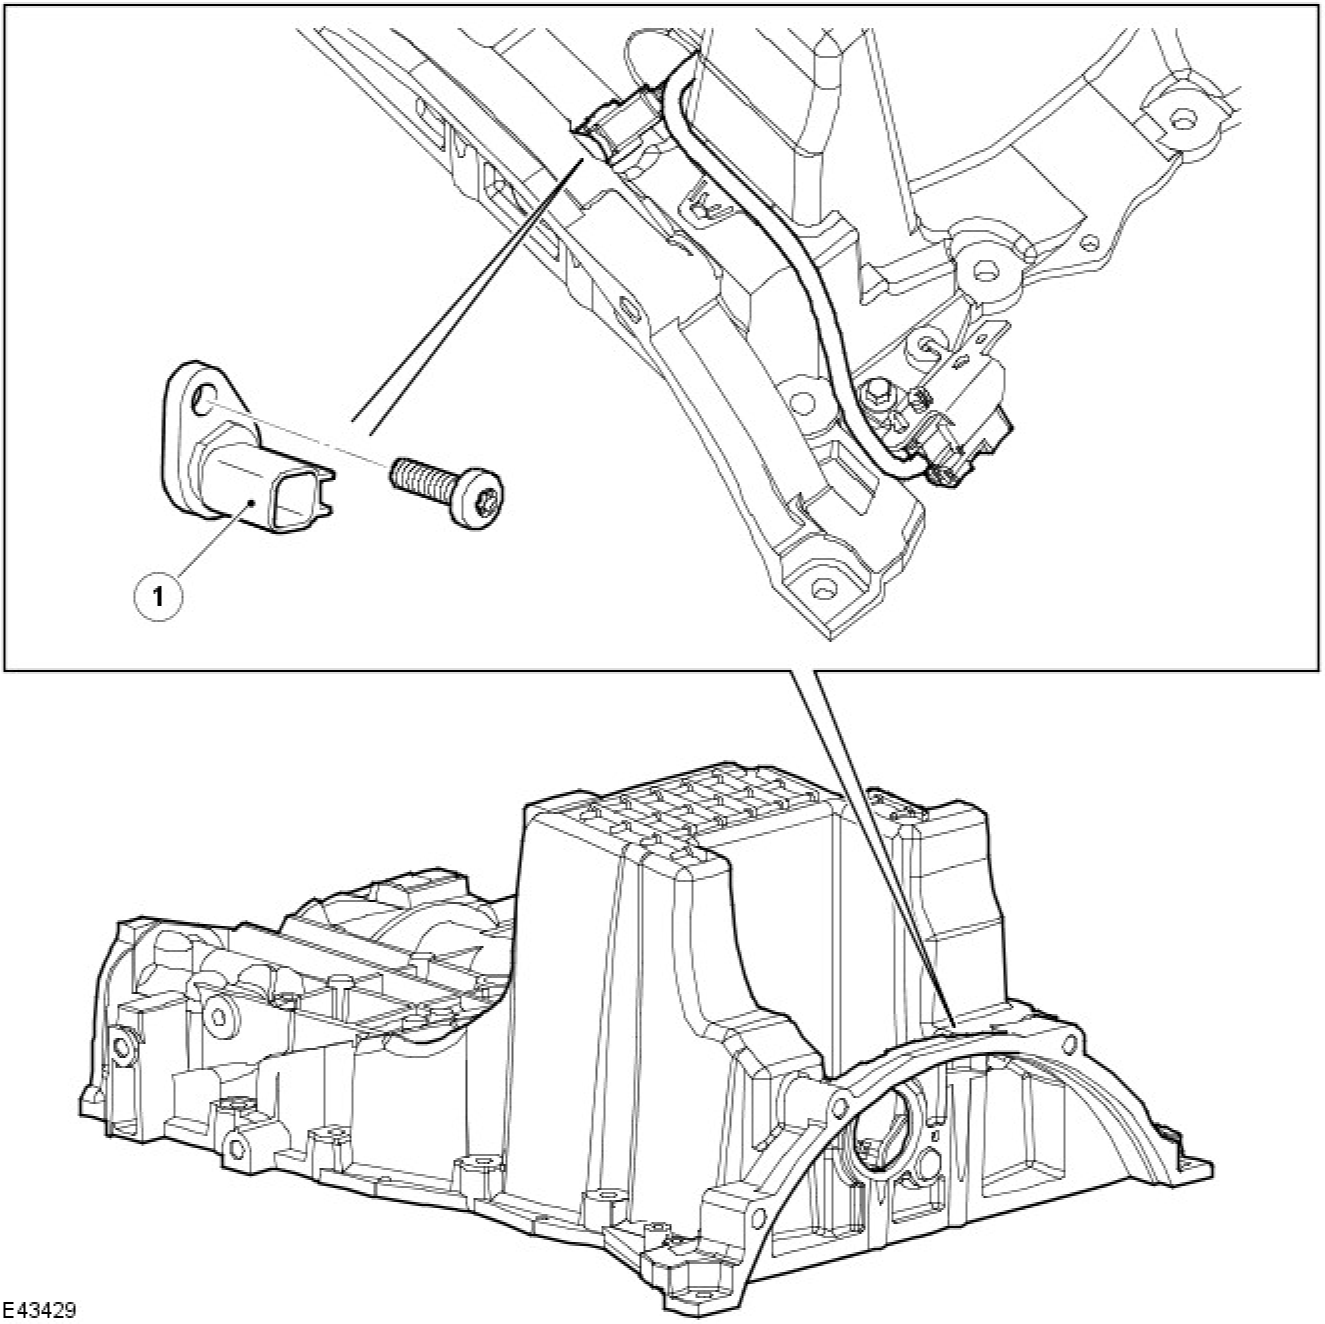
E43428

Item	Part Number	Description
1	-	Bank A (RHS)
2	-	Bank B (LHS)
3	-	Piston

The piston grade number is stamped on the crown of the piston and must coincide with that for each cylinder bore. The piston must be assembled in the correct orientation for the designated cylinder bore:

- Bank 'A' - piston grade number and the thick flange of the connecting rod must face the front of the engine
- Bank 'B' - piston grade number and the thin flange of the connecting rod must face the front of the engine

Crankshaft Position Sensor

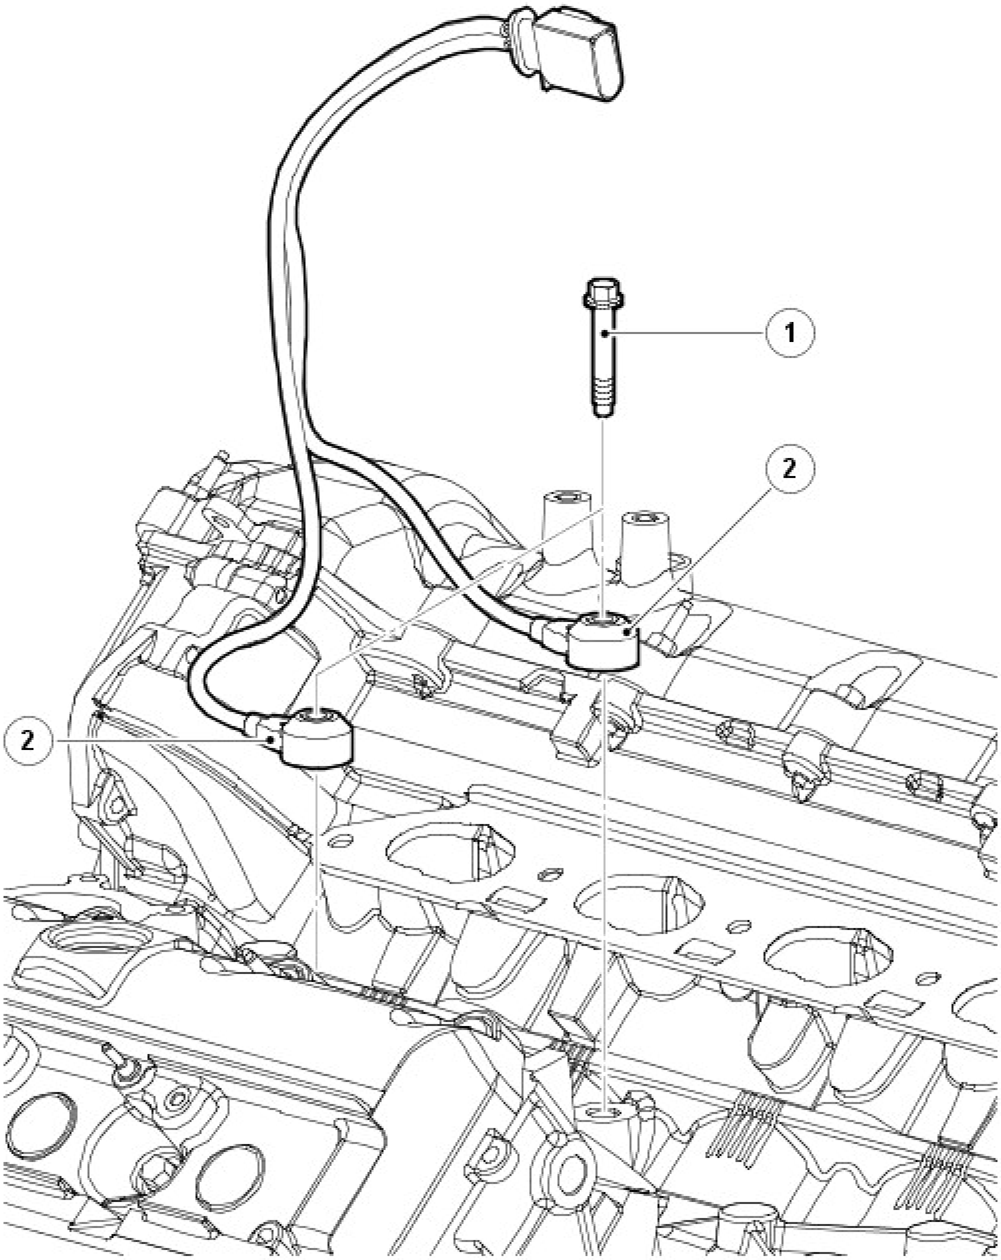


Item	Part Number	Description
1	-	Crankshaft position sensor (CKP)

The CKP sensor is installed at the rear of the sump. It is a variable reluctance sensor that provides an input of engine crankshaft speed and position.

For additional information, refer to: Electronic Engine Controls (303-14B Electronic Engine Controls - V8 4.4L Petrol, Description and Operation).

Knock Sensors



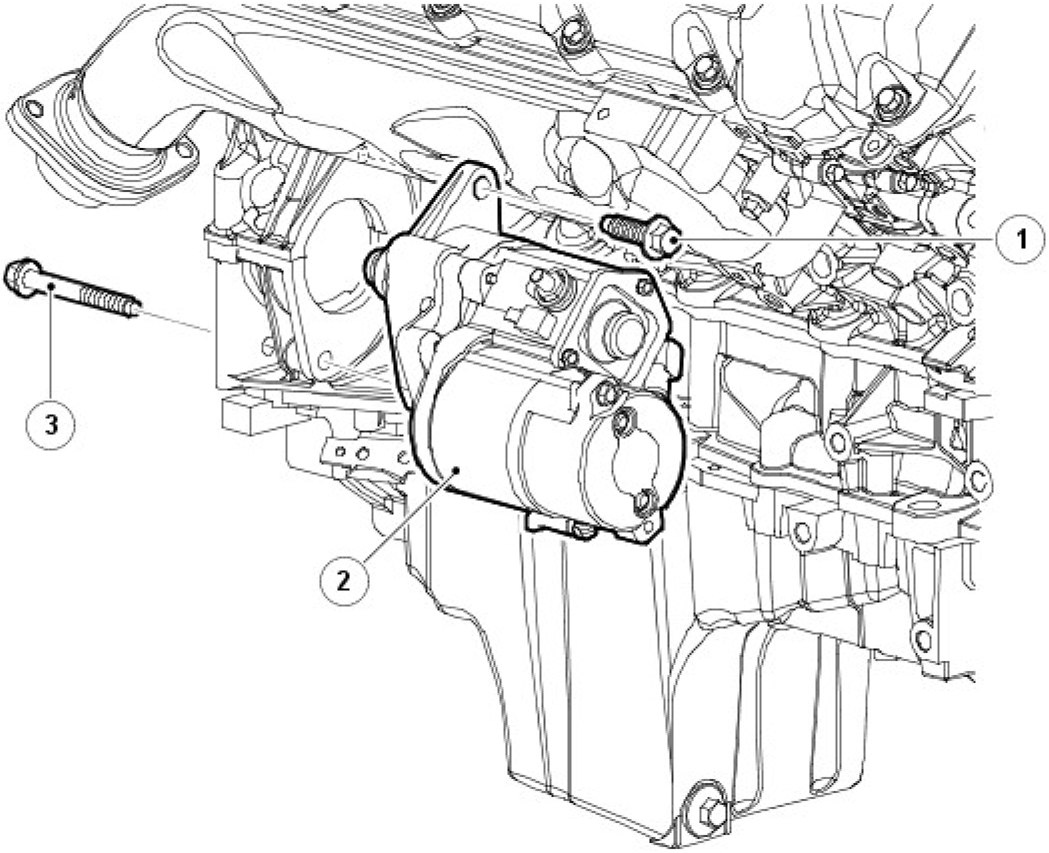
E43430

Item	Part Number	Description
1	-	Bolt
2	-	Knock sensor

The knock sensors are installed in the cylinder block on the inboard side of each cylinder bank. They are piezo-electric sensors that provide inputs to detect and locate detonation during combustion.

For additional information, refer to: Electronic Engine Controls (303-14B Electronic Engine Controls - V8 4.4L Petrol, Description and Operation).

Starter

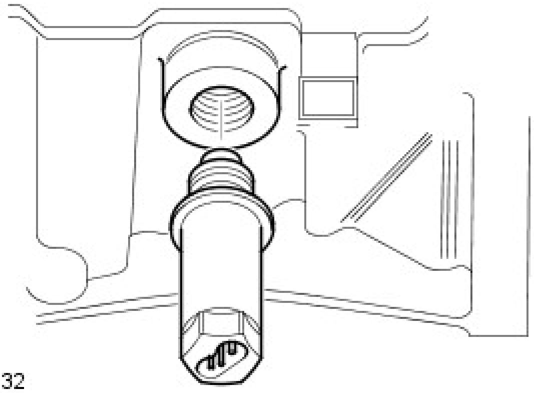


E43431

Item	Part Number	Description
1	-	Bolt
2	-	Starter motor
3	-	Bolt

The engine starter motor is installed at the rear right side of the engine, at the cylinder block to bedplate split line.
For additional information, refer to: Starting System (303-06B Starting System - V8 4.4L Petrol, Description and Operation).

Coolant Drain Plug / Heater

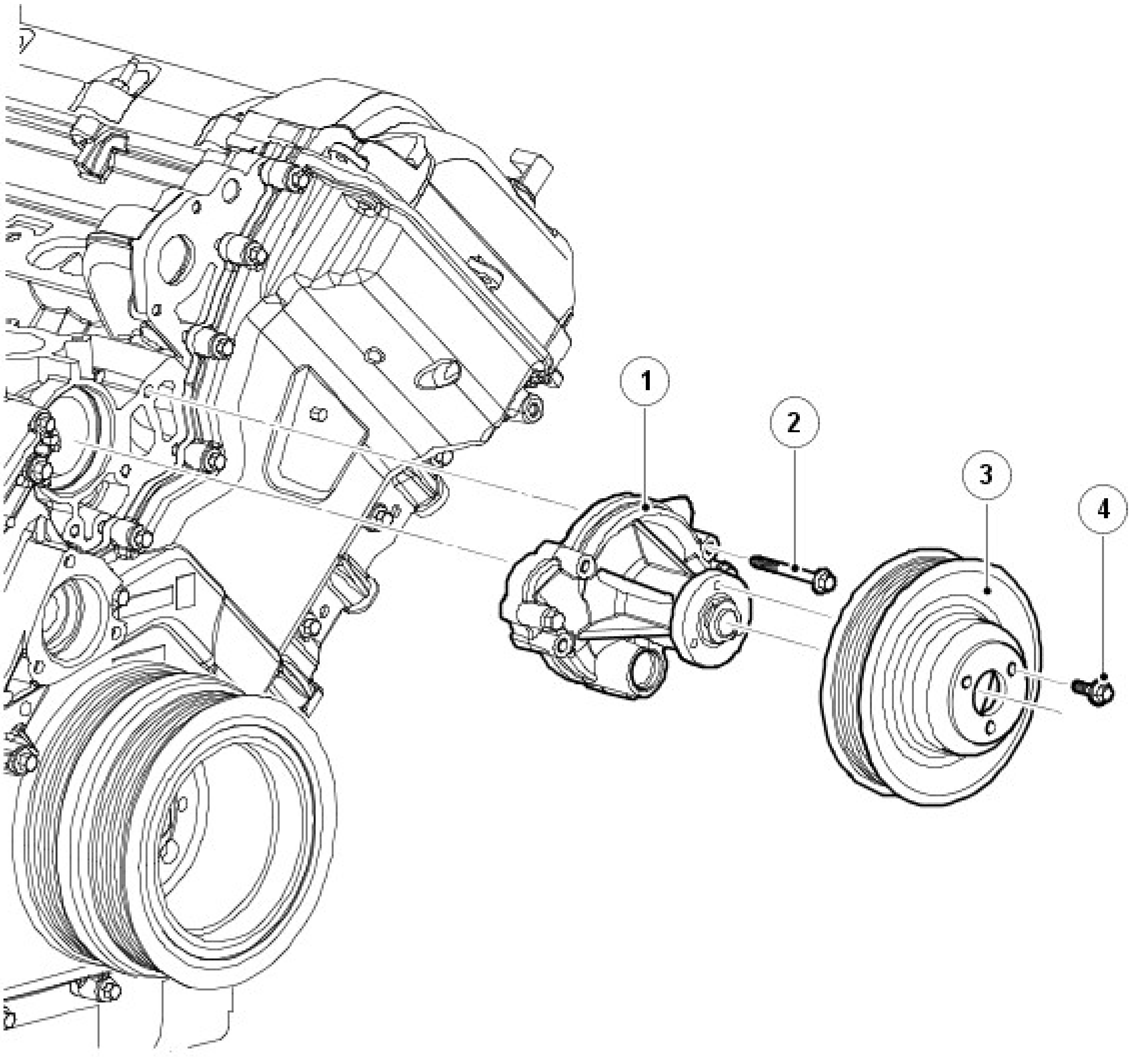


E43432

A coolant drain plug is installed on the rear left side of the cylinder block. On vehicles with the cold climate package, the cylinder block heater replaces the drain plug.

On vehicles destined for Canada, the coolant heater is installed during engine manufacture, but for Scandinavian vehicles the heater is supplied in kit form to be installed at the dealership.

Coolant Pump

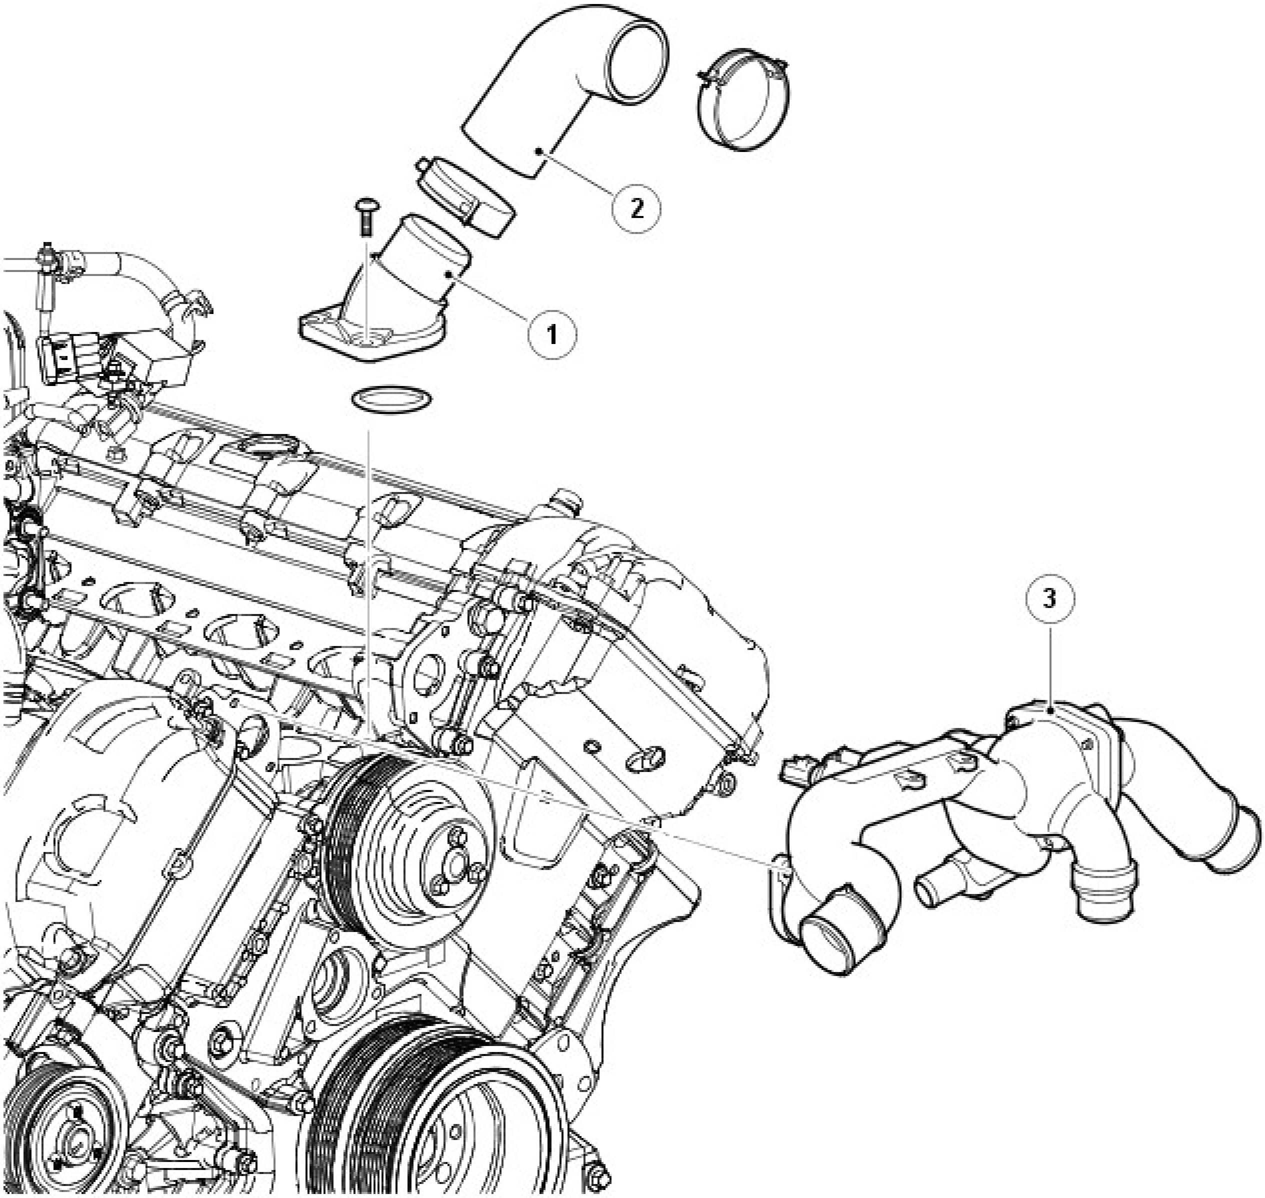


E43433

Item	Part Number	Description
1	-	Coolant pump
2	-	Bolt
3	-	Pulley
4	-	Bolt

The coolant pump is installed between the two cylinder banks, on the front face of the cylinder block.

Coolant Inlet and Outlet Assembly

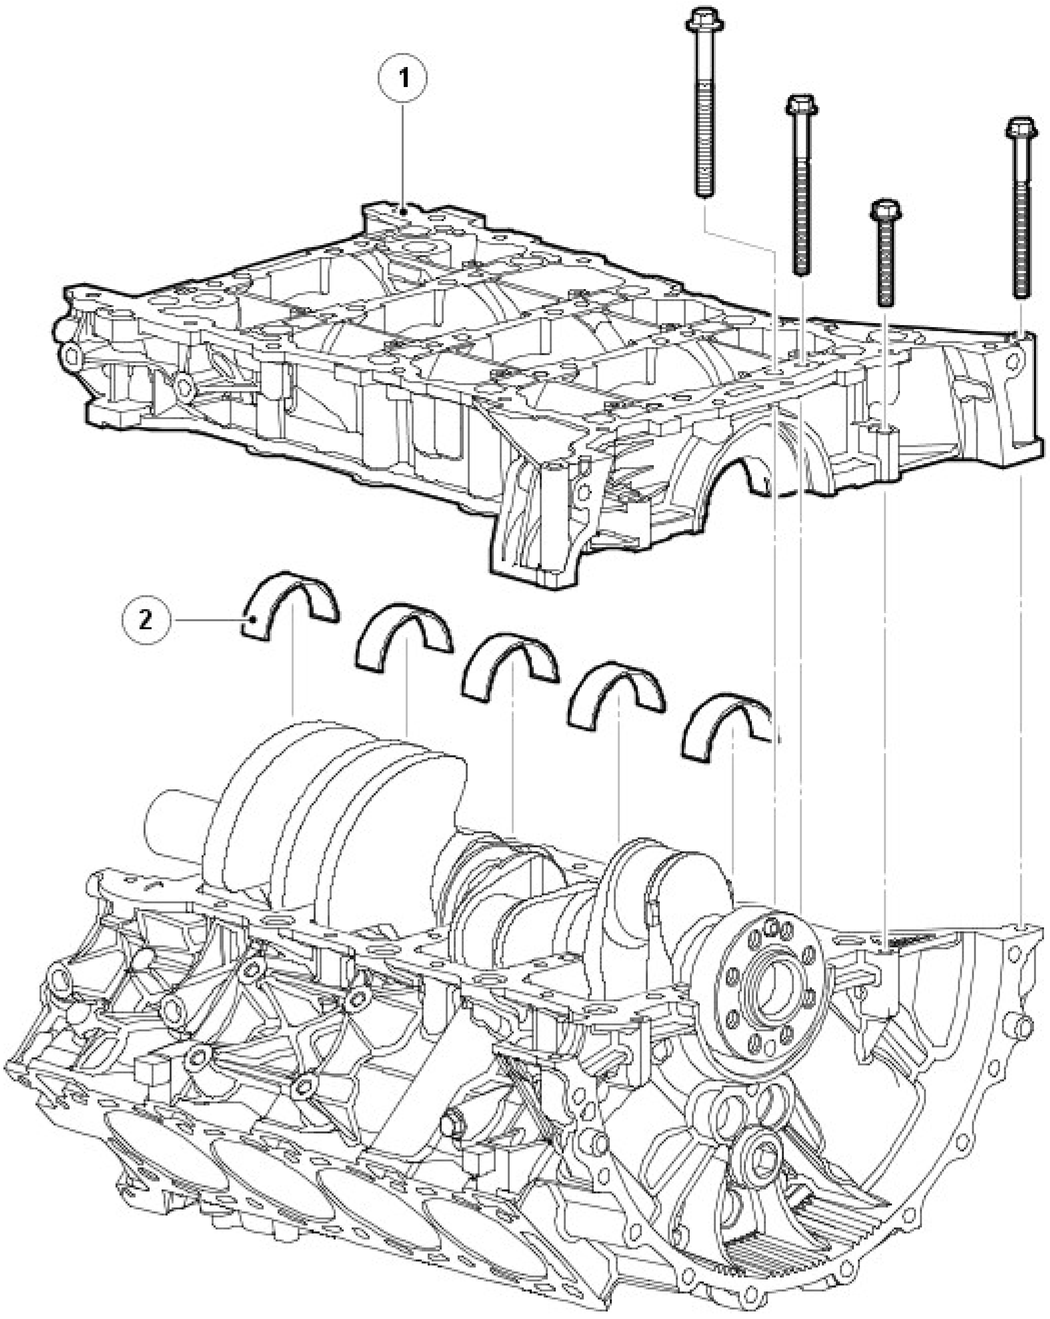


E56199

Item	Part Number	Description
1	-	Coolant outlet elbow
2	-	Coolant hose
3	-	Thermostat housing

To accommodate the installation of the supercharger, the thermostat housing and coolant outlet duct are combined into an aluminum alloy coolant outlet assembly, which is installed between the two cylinder banks, immediately above the coolant pump. A hose connects the coolant outlet assembly to a coolant inlet housing attached to the coolant pump intake on the cylinder block. The thermostat controls the flow of coolant through the radiator.

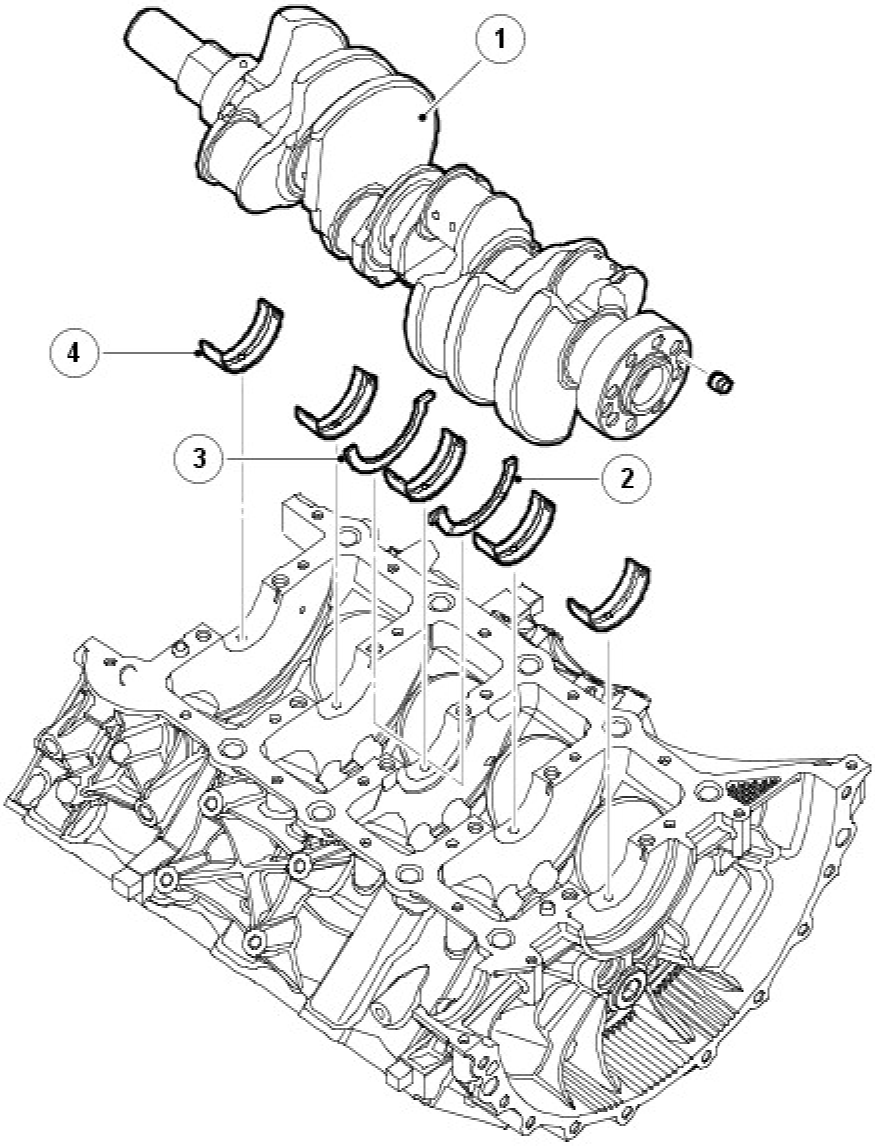
CRANKSHAFT AND SUMP COMPONENTS



E43435

Item	Part Number	Description
1	-	Bedplate
2	-	Main bearings - lower

Crankshaft and Main Bearings



E43436

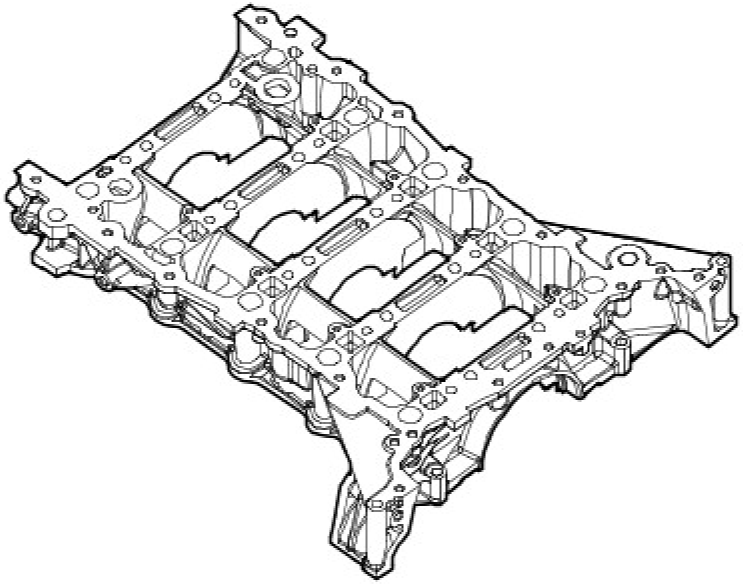
Item	Part Number	Description
1	-	Crankshaft
2	-	Thrust washer
3	-	Thrust washer
4	-	Main bearings - upper

Six counter-balance weights ensure good vibration levels from the four throw, five bearing crankshaft. Manufactured in cast iron, the crankshaft also has undercut and rolled fillets for improved strength.

The crankshaft rear oil seal is a press fit in the bedplate to cylinder block interface.

The main bearings are aluminum/tin split plain bearings. An oil groove in the upper half of each bearing transfers the oil into the crankshaft for lubrication of the connecting rod bearings. An aluminum/tin thrust washer is installed each side of the top half of the center main bearing.

Bedplate



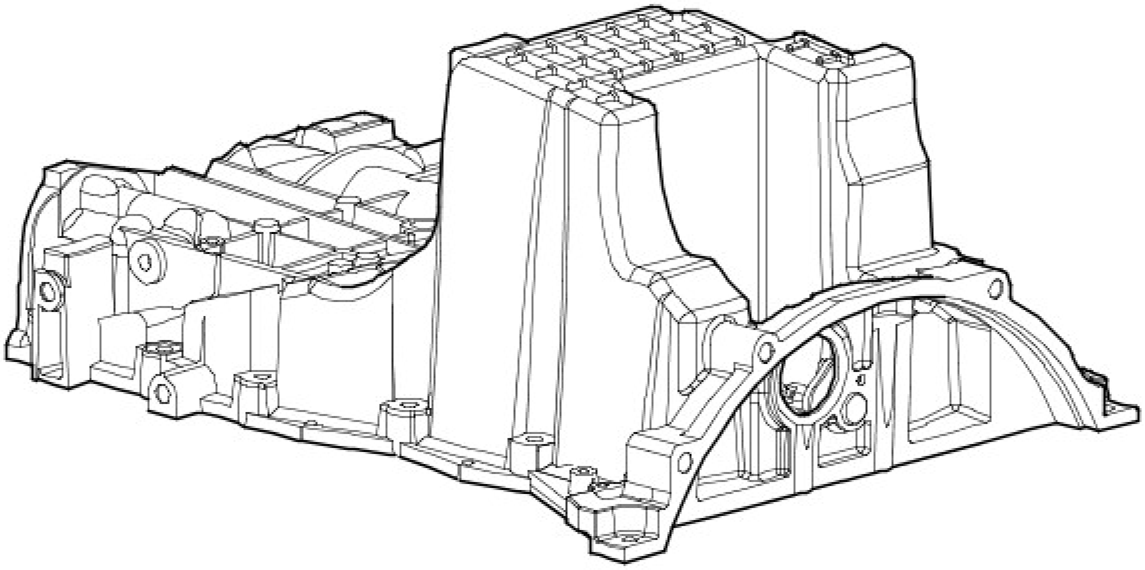
E43437

The bedplate is a structural casting bolted to the bottom of the cylinder block to retain the crankshaft. The use of a bedplate further improves rigidity. Iron inserts, cast into the main bearing supports of the bedplate, minimize main bearing clearance changes due to heat expansion.

Two hollow dowels align the bedplate with the cylinder block.

Beads of sealant seal the joint between the bedplate and the cylinder block.

Sump

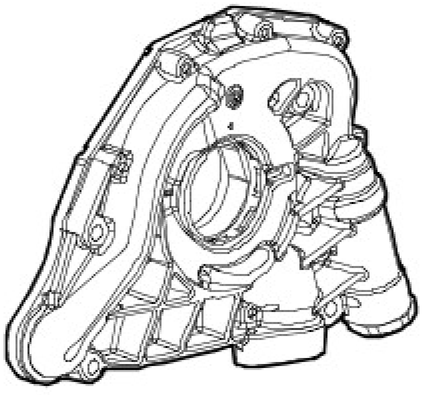


E43438

The aluminum alloy structural sump is bolted to the bedplate. A windage tray attached to the underside of the bedplate isolates the oil pan from the disturbed air produced by the rotation of the crankshaft, to prevent oil aeration and improve oil drainage. A rubber plug at the rear of the structural sump seals the port that provides access to the torque converter securing bolts. The engine oil drain plug is located at the front right corner of the oil pan.

A bead of sealant seals the joint between the structural sump and the bedplate.

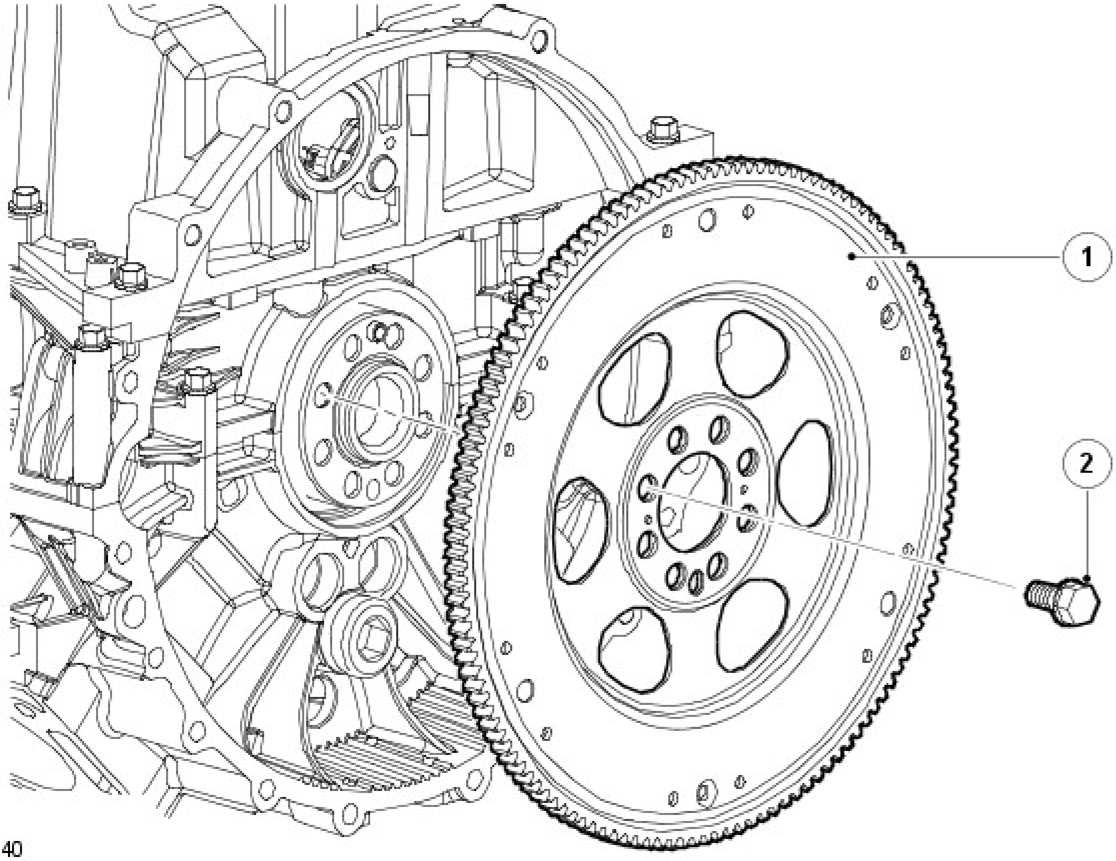
Oil Pump



E43439

The oil pump is installed on the crankshaft at the front of the engine. The pump outlet port aligns with oil passages in the bedplate.

Starter Drive Plate



E43440

Item	Part Number	Description
1	-	Starter drive plate
2	-	Bolt

The starter drive plate is attached to the rear of the crankshaft. A timing disc, for the engine speed sensor, is spot welded to the front face of the drive plate.

Timing Gear

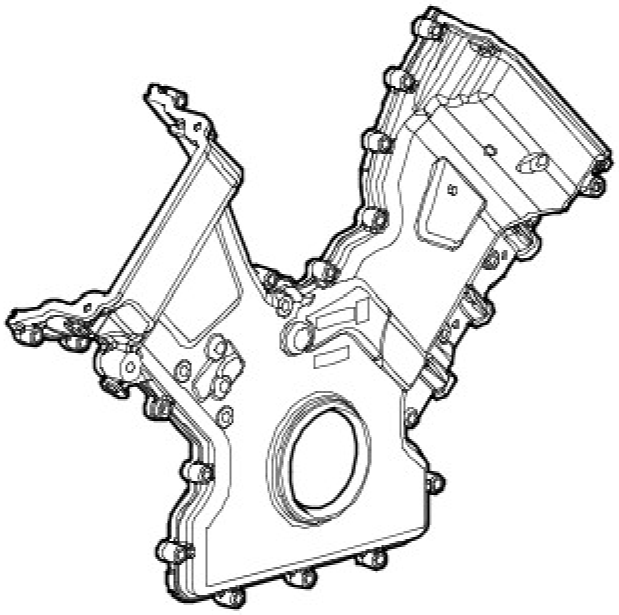
Multiple link primary and single row secondary chains drive the camshafts of each cylinder bank. The primary chains transmit drive from two sprockets on the crankshaft to each intake camshaft sprocket. The secondary chains transmit drive from the intake camshaft sprockets to the exhaust camshafts.

A key locates the two drive sprockets on the crankshaft. The crankshaft's torsional vibration damper retains the sprockets in position. The intake and exhaust camshaft sprockets are non-interference, non-keyed fit on their respective camshafts; the drive being transmitted by the face-to-face friction load produced by the sprocket-securing bolt.

Each chain has a hydraulic tensioner operated by engine oil. The primary chains are lubricated via oil squirt tubes located at the front of the engine block, near the crankshaft drive sprockets. A jet of oil from the end of each secondary chain tensioner lubricates the secondary chains. The primary chain tensioners act on pivoting flexible tensioner blades. The secondary chain tensioners act directly on the chains. Guide rails are installed on the drive side of the primary chains.

In ceratin markets some engines are equipped with VVT timing gear.
For additional information, refer to: Engine (303-01B Engine - V8 4.4L Petrol, Description and Operation).

Timing Cover



E43443

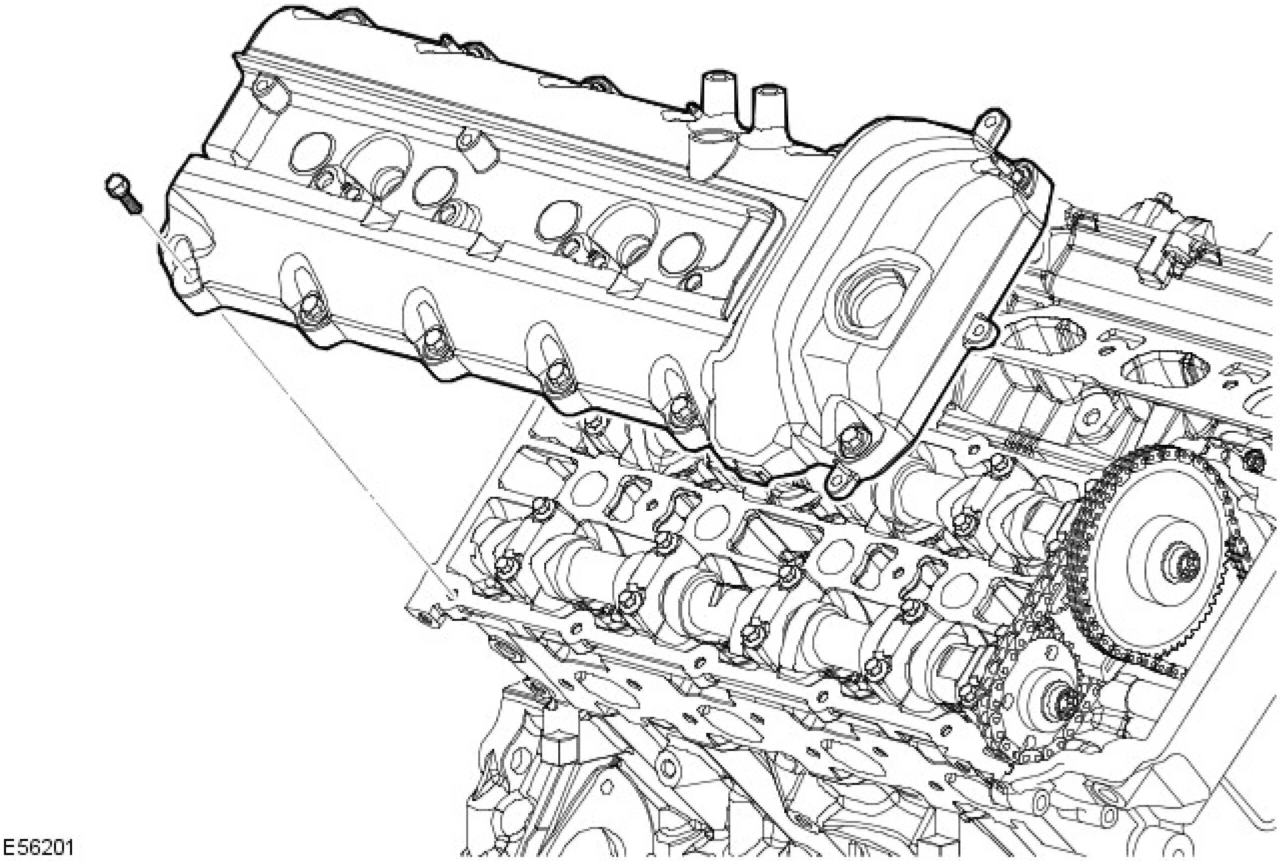
Cylinder Heads

The cylinder heads are unique to each cylinder bank. Deep-seated bolts, to reduce distortion, secure the cylinder heads to the cylinder block. Two hollow dowels align each cylinder head with the cylinder block.

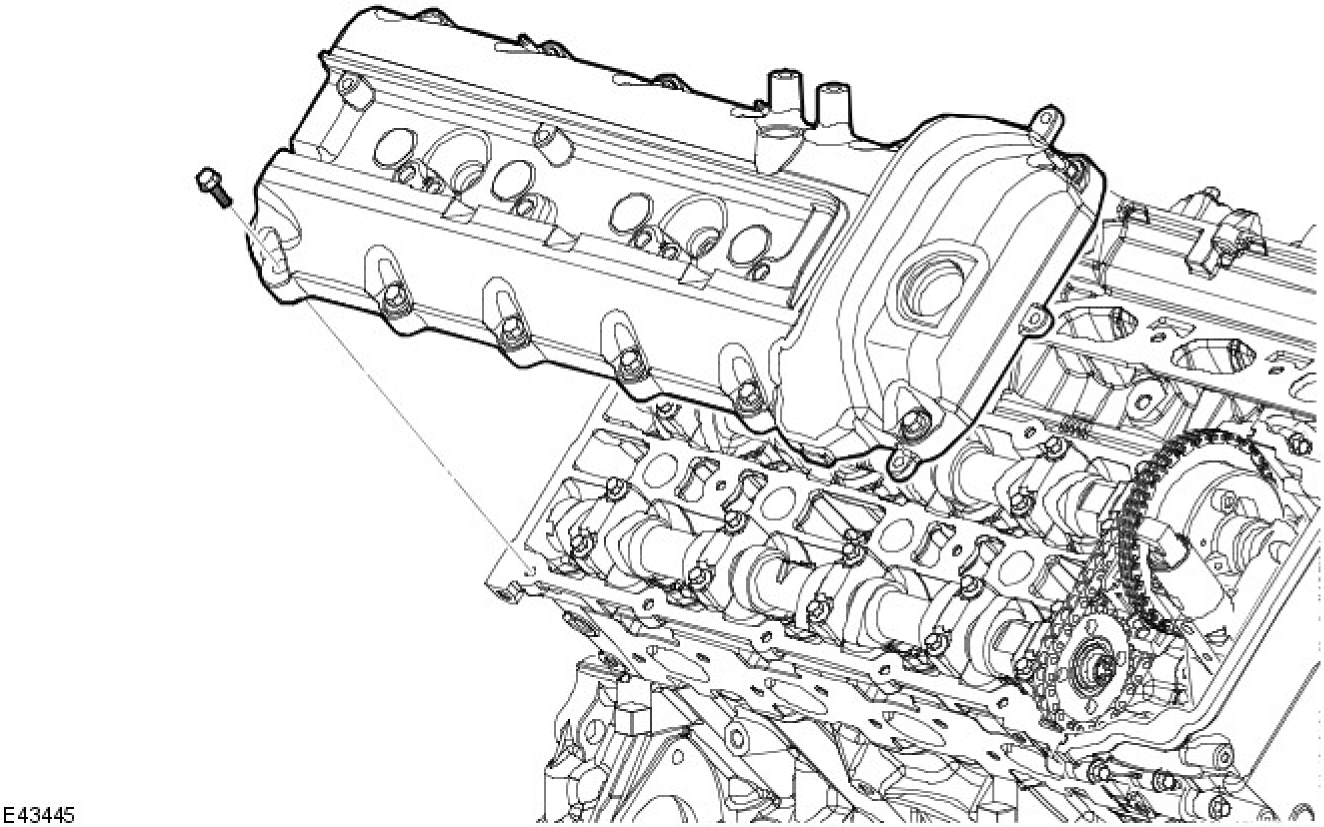
The 14 mm spark plugs, one per cylinder, locate in recesses down the center line of each cylinder head.

The engine-lifting eyes are bolted to the cylinder heads; two on the rear (one per head) and one at the front.

Camshaft Covers



- NOTE: Vehicles fitted with Variable Valve Timing (VVT).



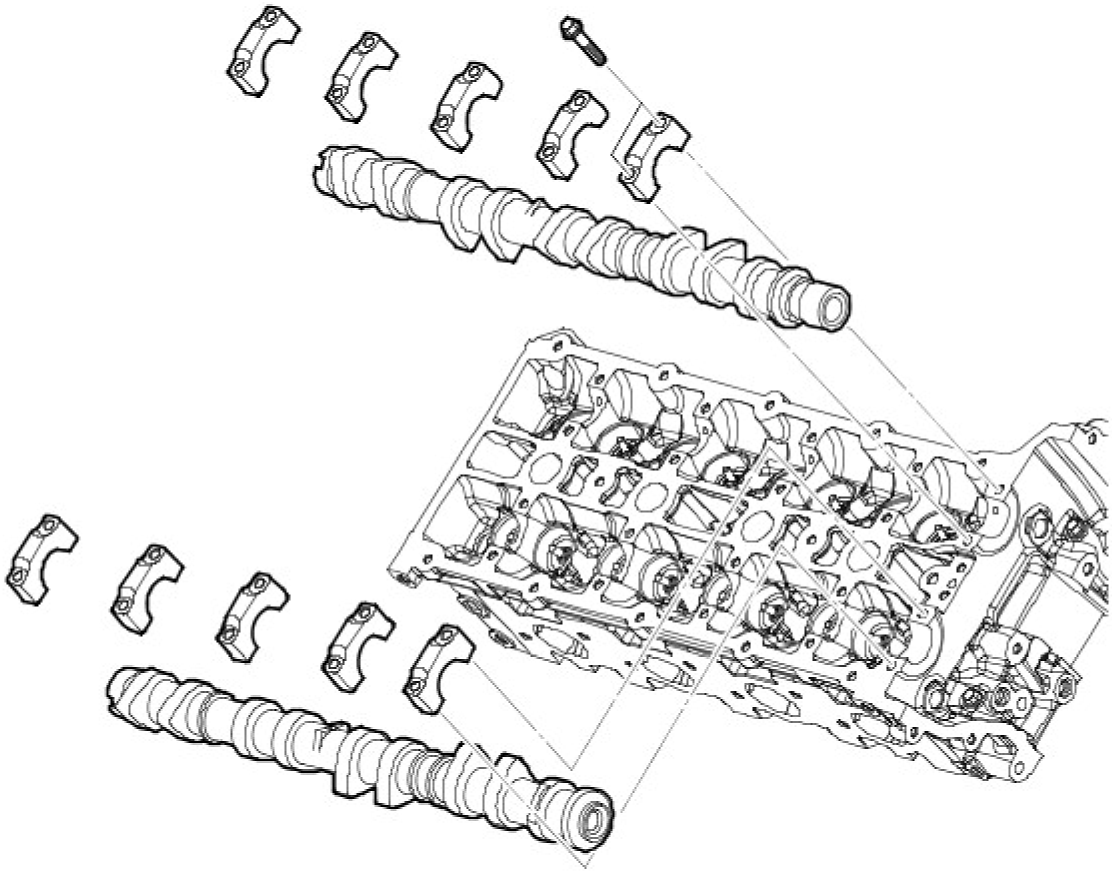
The camshaft covers are manufactured from thermo-plastic. The A bank camshaft cover incorporates an outlet for the part load engine breather and the Pressure Control Valve (PCV). The B bank camshaft cover incorporates an outlet for the full load engine breather and the engine oil filler cap. Identical oil separators are incorporated below the breather outlet in each cover.
For additional information, refer to: Electronic Engine Controls (303-14B Electronic Engine Controls - V8 4.4L Petrol, Description and Operation).

Silicon rubber in-groove gaskets seal the joints between the camshaft covers and the cylinder heads. Together with spacers and seals on the camshaft cover fasteners, they also isolate the covers from direct contact with the cylinder heads, to reduce noise.

Cylinder Head Gasket

The multi-layered steel cylinder head gasket has cylinder specific water flow cross-sections for uniform coolant flow.

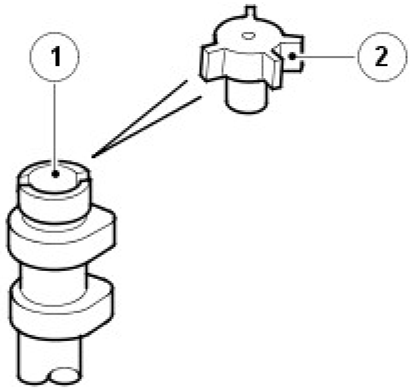
Camshafts



E43446

The camshafts are manufactured in chilled cast iron. Five aluminum alloy caps retain each camshaft. Location numbers, 0 to 4 for the intake camshaft and 5 to 9 for the exhaust camshaft, are marked on the outer faces of the caps.

Sensor Ring

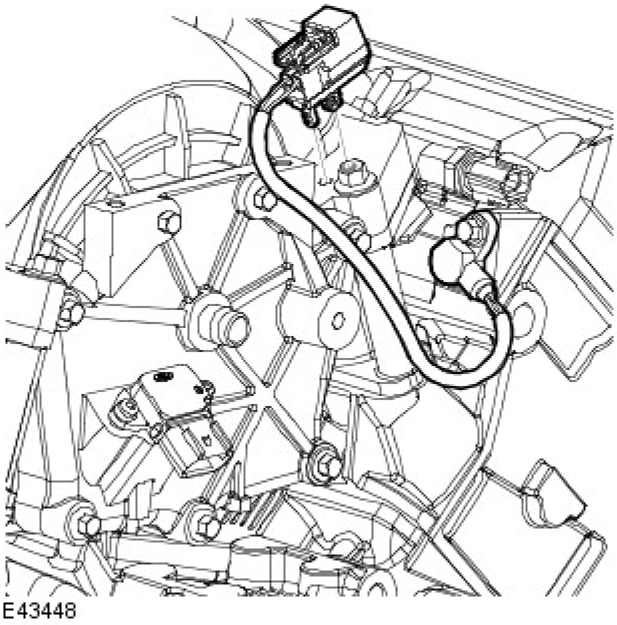


E43447

Item	Part Number	Description
1	-	Inlet camshaft
2	-	Sensor ring

Timing rings for each camshaft position sensor are located at the rear of both intake camshafts. A flat, machined near the front of each camshaft, enables the camshafts to be locked during the valve timing procedure.

Camshaft Position Sensor



The camshaft position sensors are installed in each cylinder head at the rear of the intake camshaft. It is a variable reluctance sensor that provides an input to the ECM regarding the position of the camshaft.
For additional information, refer to: Electronic Engine Controls (303-14B Electronic Engine Controls - V8 4.4L Petrol, Description and Operation).

Inlet and Exhaust Valves

Each cylinder head incorporates dual overhead camshafts operating four valves per cylinder via solid shimless valve lifters.

The lightweight valve gear provides good fuel economy and noise levels. Valve head diameters are 31mm (1.220 in) for the exhaust and 35mm (1.378 in) for the intake. All valves have 5mm (0.197 in) diameter stems supported in sintered metal seats and guide inserts. Collets, valve collars and spring seats locate single valve springs on both intake and exhaust valves. Valve stem seals are integrated into the spring seats.

⚠CAUTION: Due to slight variations in length, the valves are **not** interchangeable between marques (Land Rover, Jaguar and Aston Martin).

10	-	Intercooler adaptor
11	-	Fuel rail
12	-	Noise isolator
13	-	Supercharger

The supercharger is a compressor used to pump an air into the cylinders. This increases the concentration of oxygen and fuel in the charge to create a more powerful combustion inside the cylinder. This increases cylinder pressure upon ignition and creates more power.

As the supercharger compresses the air its temperature increases. This raise in air temperature reduces the potential for power gains. By installing intercoolers the air is cooled to overcome this.

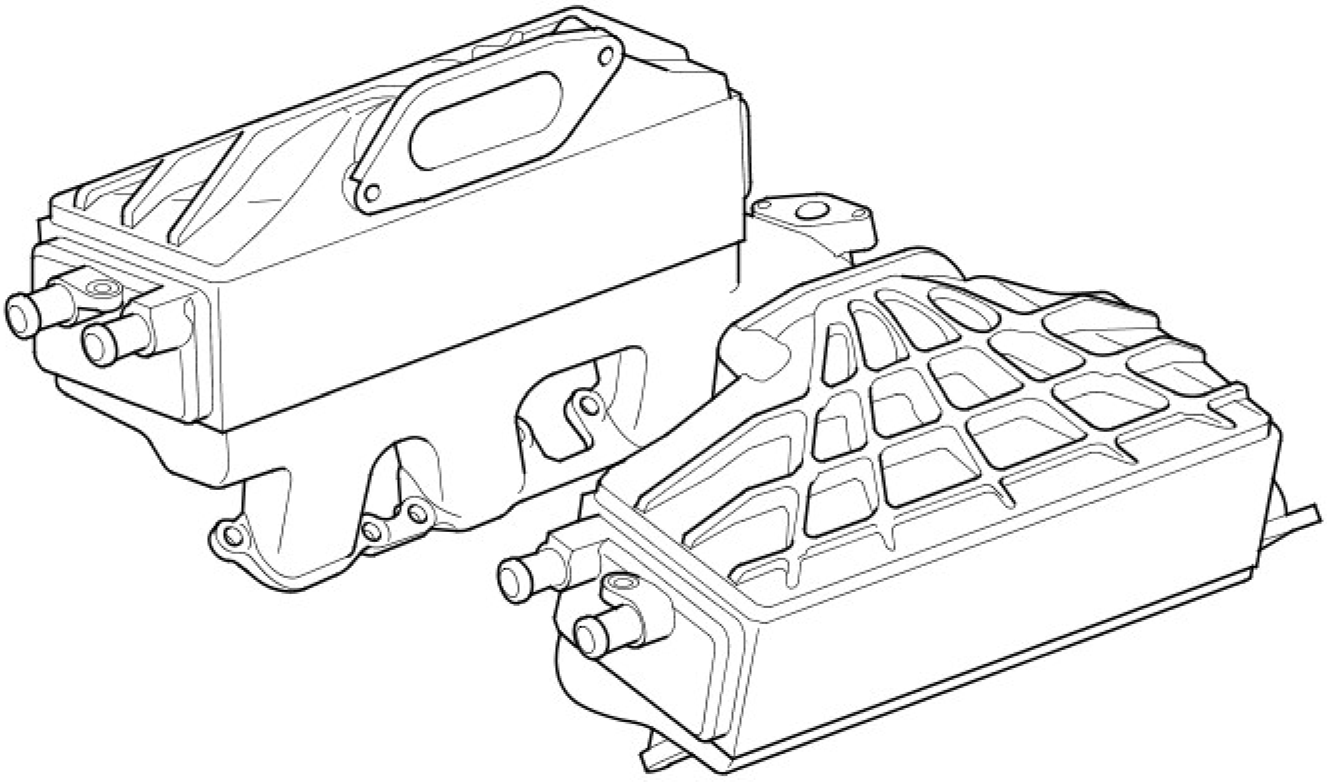
The supercharger is an Eaton M112 unit attached to the three mounting bosses between the 'V' of the cylinder block. Positive alignment with the drive belt is provided by a doweled mounting bracket. An eight-ribbed belt drives the supercharger, via the crankshaft, at 2.1 engine speed. The maximum pressure increase is approximately 0.8 bar.

On the 4.2L V8 supercharged engine the intake manifold is replaced by:

- A supercharger.
- Two intercoolers.
- An outlet duct.
- A bypass valve.
- A bypass valve actuator.
- Two intercooler adapters.
- Fuel rails.

The supercharger has a sealed-for-life internal lubrication system.

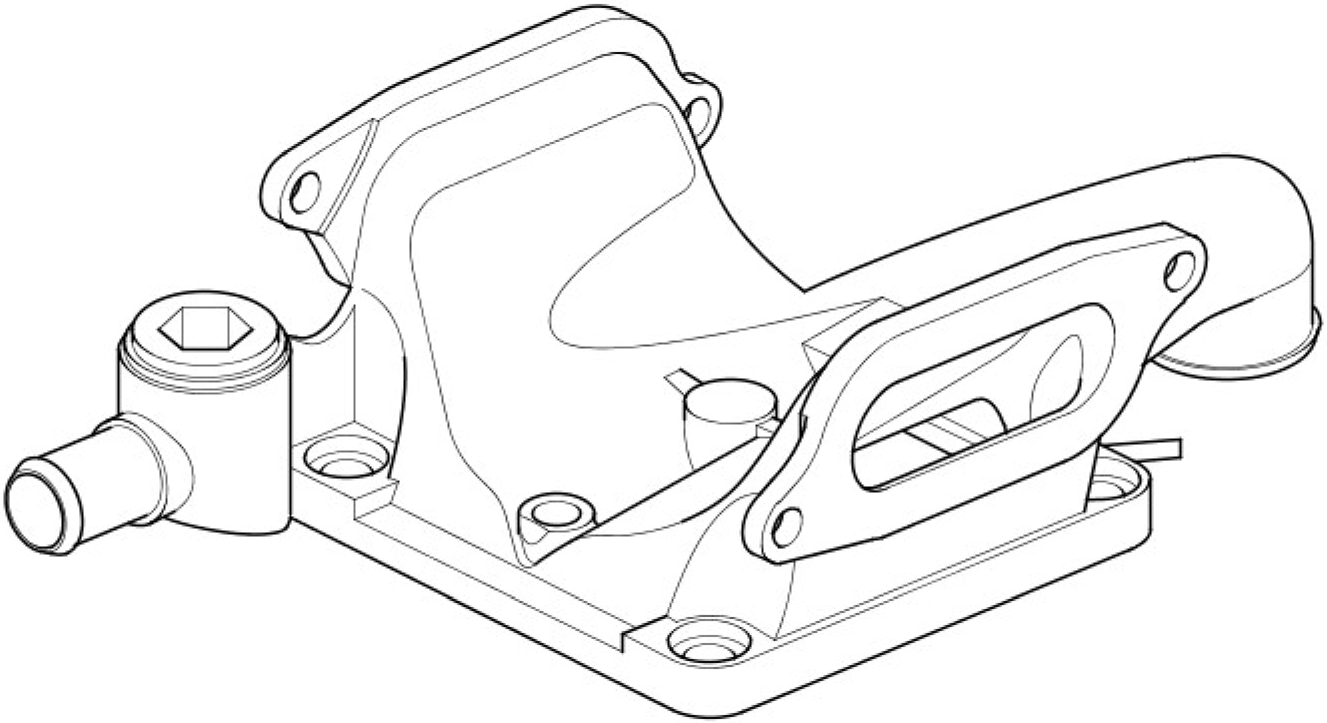
Intercooler



E56203

Each of the two intercoolers is a fin and tube air-to-liquid heat exchanger. Two rubber ducts, secured by clamp plates, provide the interfaces between the outlet duct and the intercoolers. After passing through the heat exchanger core, the air flows into individual outlets to the cylinders. At the rear of the B bank intercooler there is a mounting boss for an air intake temperature sensor.

Outlet Duct



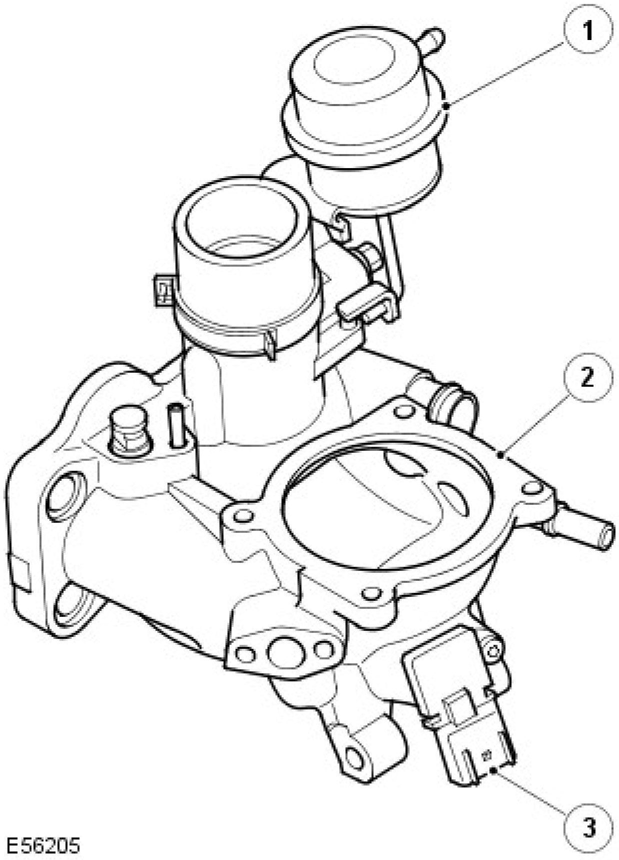
E56204

The outlet duct directs air from the supercharger into the two intercoolers. A filler point for the intercooler coolant system is integrated into the front and right side of the outlet duct. **This connection is not used on Land Rover vehicles.** A vacuum take-off for the fuel pressure regulator/cruise control system is located on the right side of the outlet duct. Isolating bolts, to reduce noise, secure the outlet duct to the supercharger and a rubber gasket seals the supercharger to the outlet duct interface.

Bypass Valve

The bypass valve attaches to an opening in the induction elbow and controls a bypass flow from the intercoolers back to the inlet side of the supercharger. At closed or partially open throttle settings (i.e. idle and most cruise conditions), the bypass valve is fully open to provide maximum bypass and optimum fuel economy. As the throttle opens, the bypass valve progressively closes to reduce the bypass flow and increase the pressure of air supplied to the engine for optimum power output.

Bypass Valve and Actuator

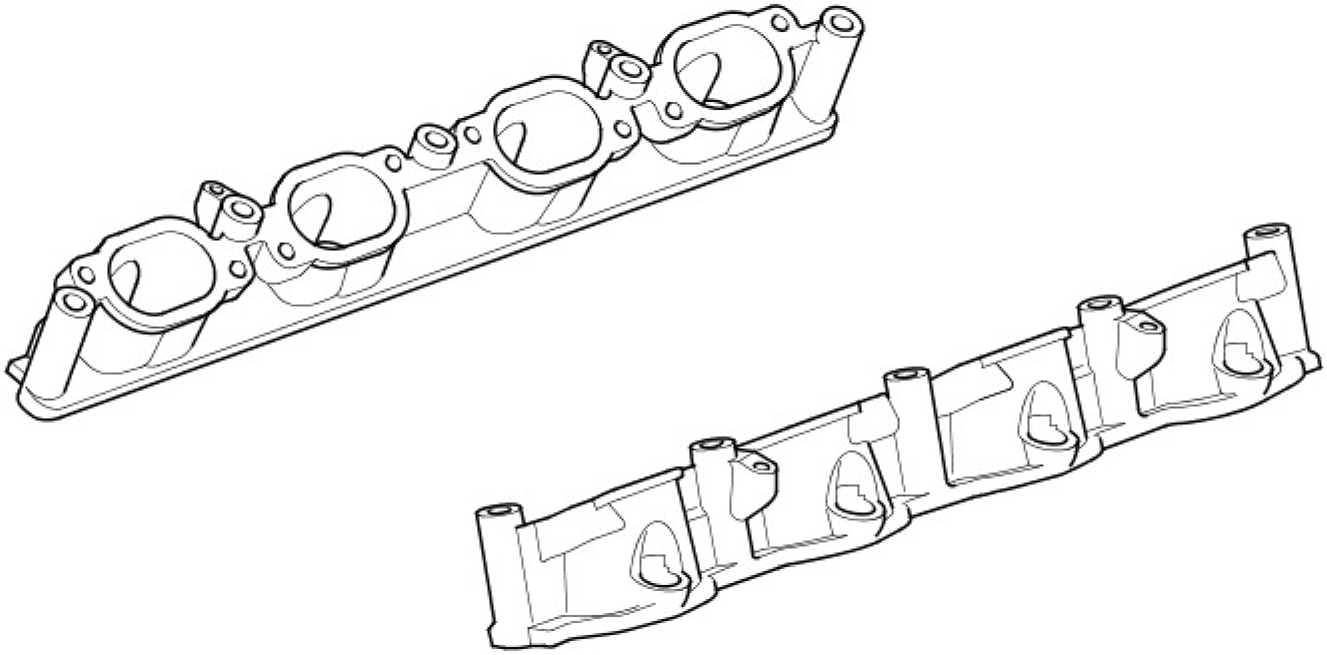


Item	Part Number	Description
1	-	Bypass valve actuator
2	-	Induction elbow
3	-	MAP sensor

Bypass Valve Actuator

The bypass valve actuator is a diaphragm-operated actuator attached to the valve spindle of the bypass valve. A vacuum pipe connects the actuator to the induction elbow.

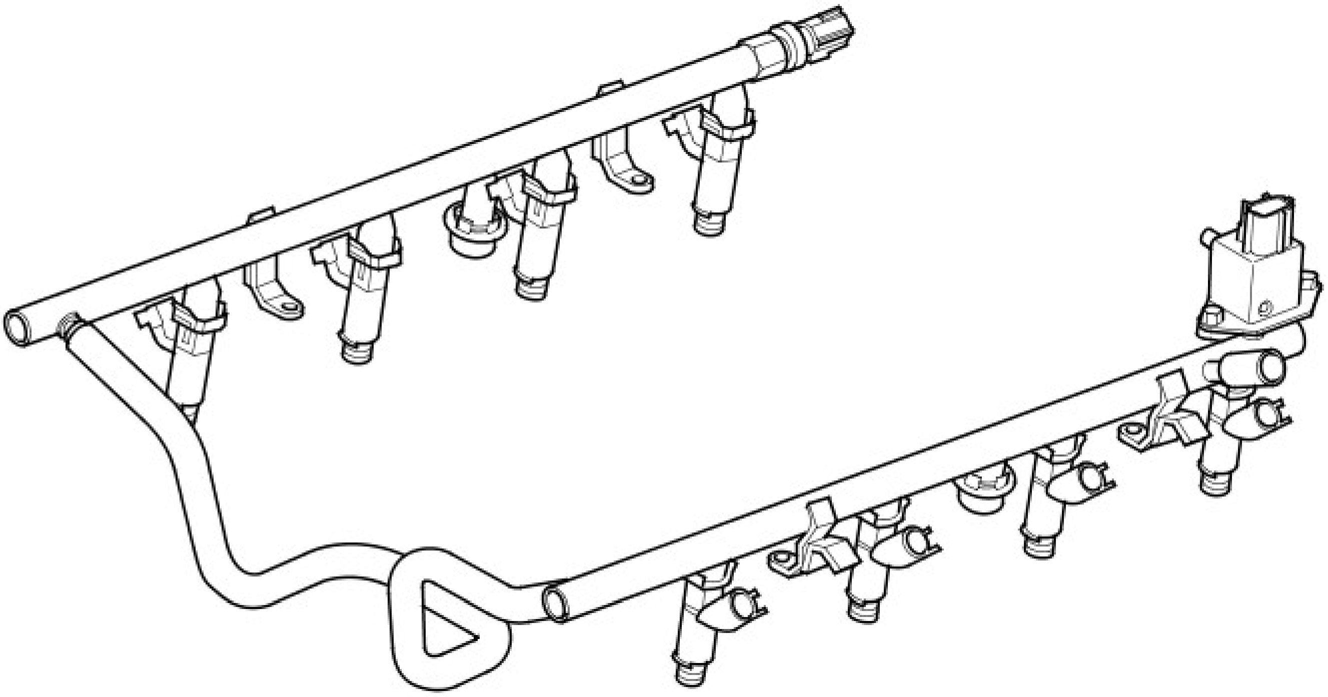
Intercooler Adapters



E56206

The intercooler adapters provide an interface between the intercoolers and the cylinder heads, and also locate the fuel rails and injectors. One-piece gaskets seal the joints between the intercoolers and the intercooler adapters, and between the intercooler adapters and the cylinder heads.

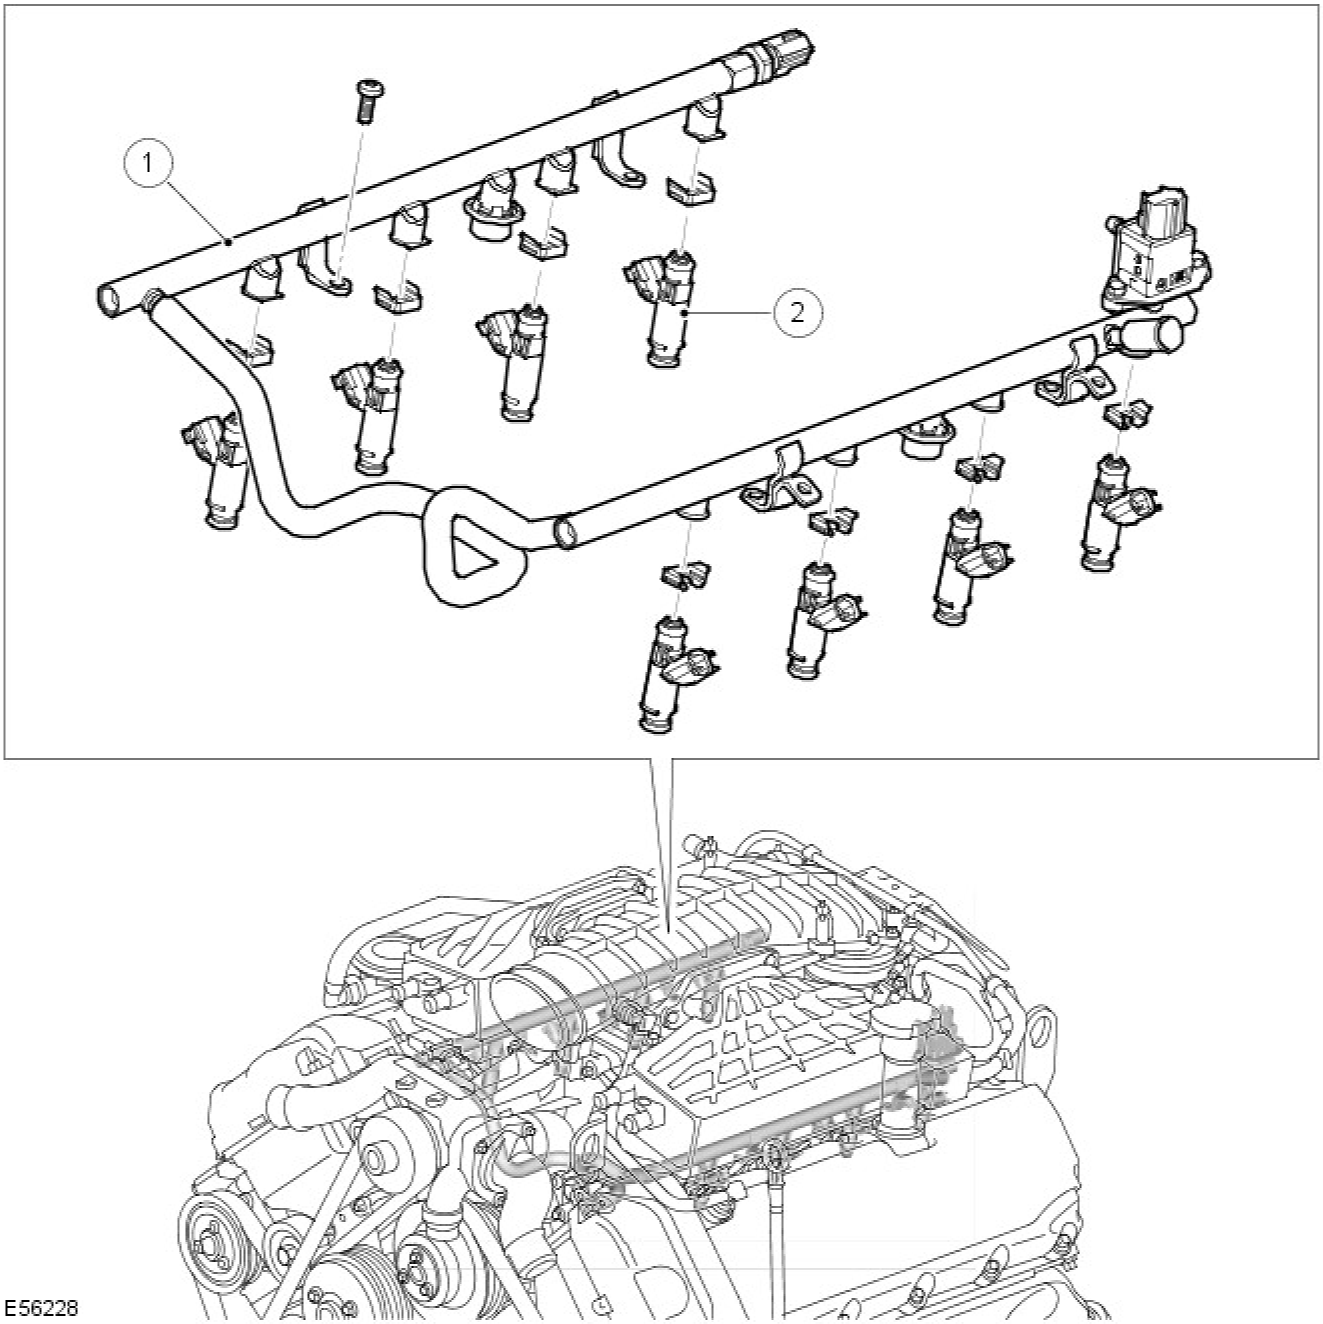
Fuel Rails



E56207

The fuel rails are installed on the intercooler adapters. A fuel crossover pipe connects the fuel rails together at the front of the engine.

Fuel Injectors



Item	Part Number	Description
1	-	Fuel rail
2	-	Injectors

Eight, top fed, 12-hole, fuel injectors are installed in the fuel rails and are held in position by spring clips. Two O-rings are installed between the injector mounts of the fuel rails and the related recesses in the intercooler adapters. The injectors are electromagnetic solenoid valves controlled by the ECM. The fuel jets from the injectors are directed onto the back of the intake valves.

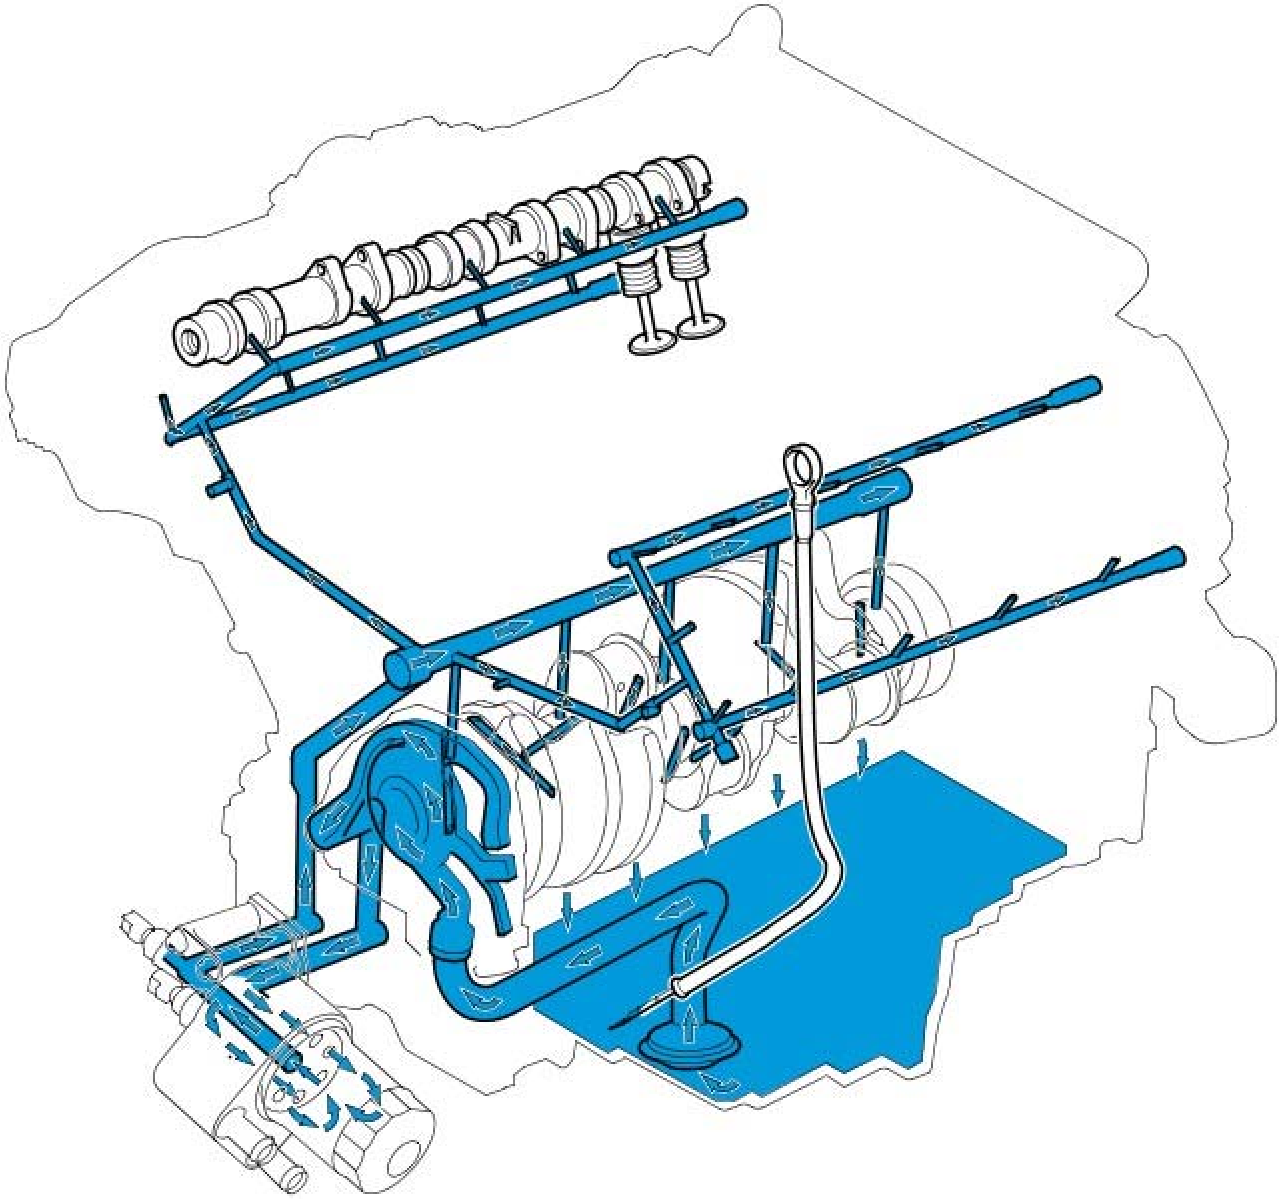
LUBRICATION SYSTEM



E43454

General

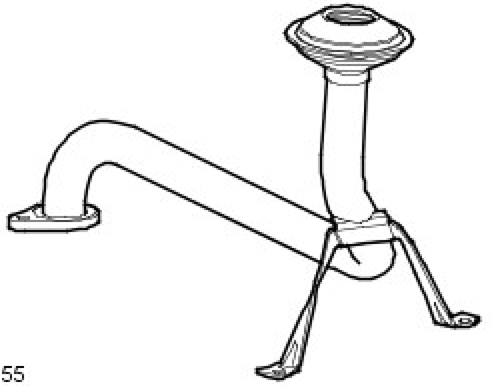
Oil is drawn from the reservoir in the oil pan and pressurized by the oil pump. The output from the oil pump is then filtered, cooled and distributed through internal oil passages.

All moving parts are lubricated by pressure or splash oil. Pressurized oil is also provided for the timing gear chain tensioners and the piston cooling jets.

The oil returns to the oil pan under gravity. Large drain holes through the cylinder heads and cylinder block ensure the quick return of the oil, reducing the volume of oil required and enabling an accurate check of the contents soon after the engine stops.

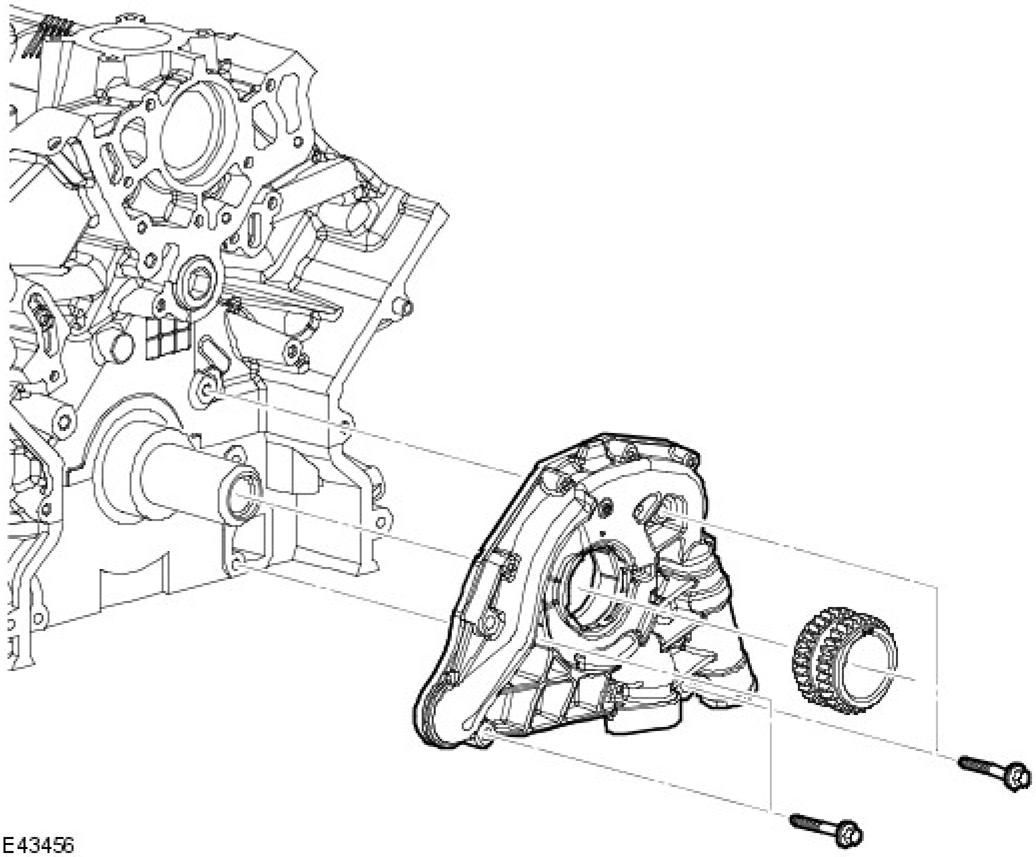
System replenishment is through the oil filler cap on the 'B' bank camshaft cover.

Oil Pick-up



The fabricated steel oil pick-up is immersed in the oil reservoir to provide a supply to the oil pump during all normal vehicle attitudes. A mesh screen in the inlet prevents debris from entering the oil system.

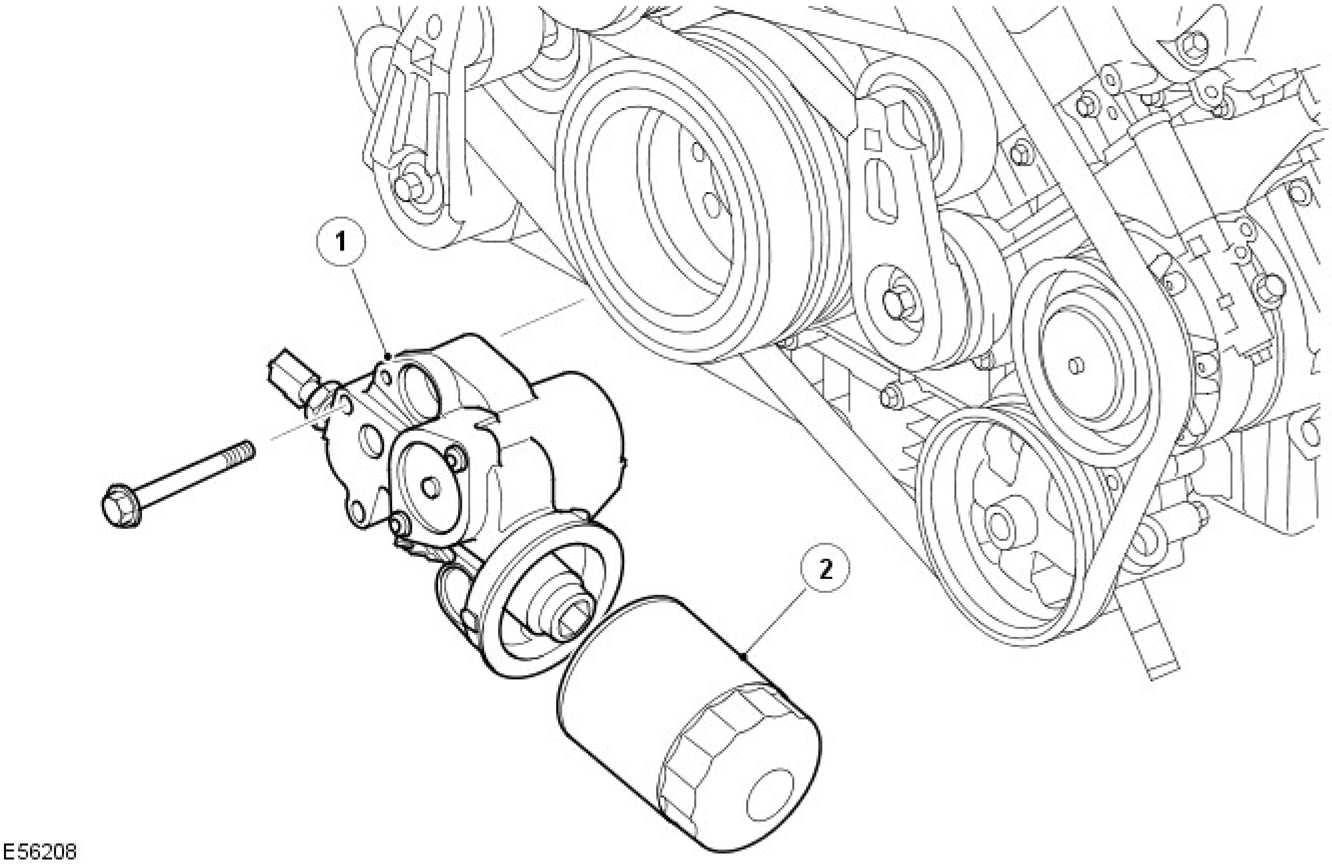
Oil Pump



The oil pump is installed on the crankshaft at the front of the engine. The pump outlet port aligns with oil passages in the bedplate.

The pumping element is an eccentric rotor, which is directly driven by flats on the crankshaft. An integral pressure relief valve regulates pump outlet pressure at 4.5 bar (65.25 psi).

Oil Filter Assembly

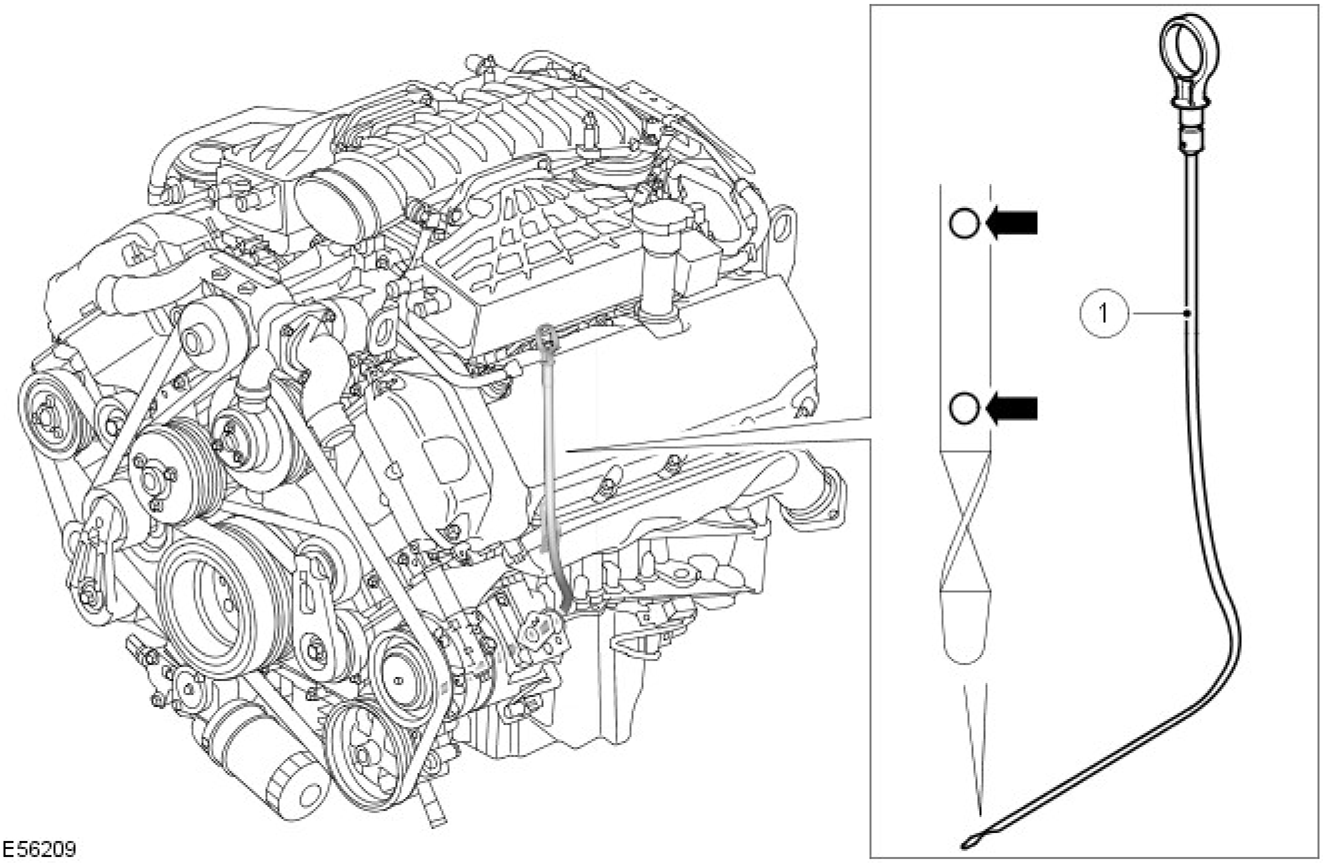


Item	Part Number	Description
1	-	Oil bypass tube
2	-	Oil filter head assembly
3	-	Oil filter

The oil filter is a replaceable cartridge installed on an adapter. An internal bypass facility permits full flow bypass if the filter is blocked.

The oil pressure switch connects a ground input to the instrument cluster when oil pressure is present. The switch operates at a pressure of 0.15 to 0.41 bar (2.2 to 5.9 psi).

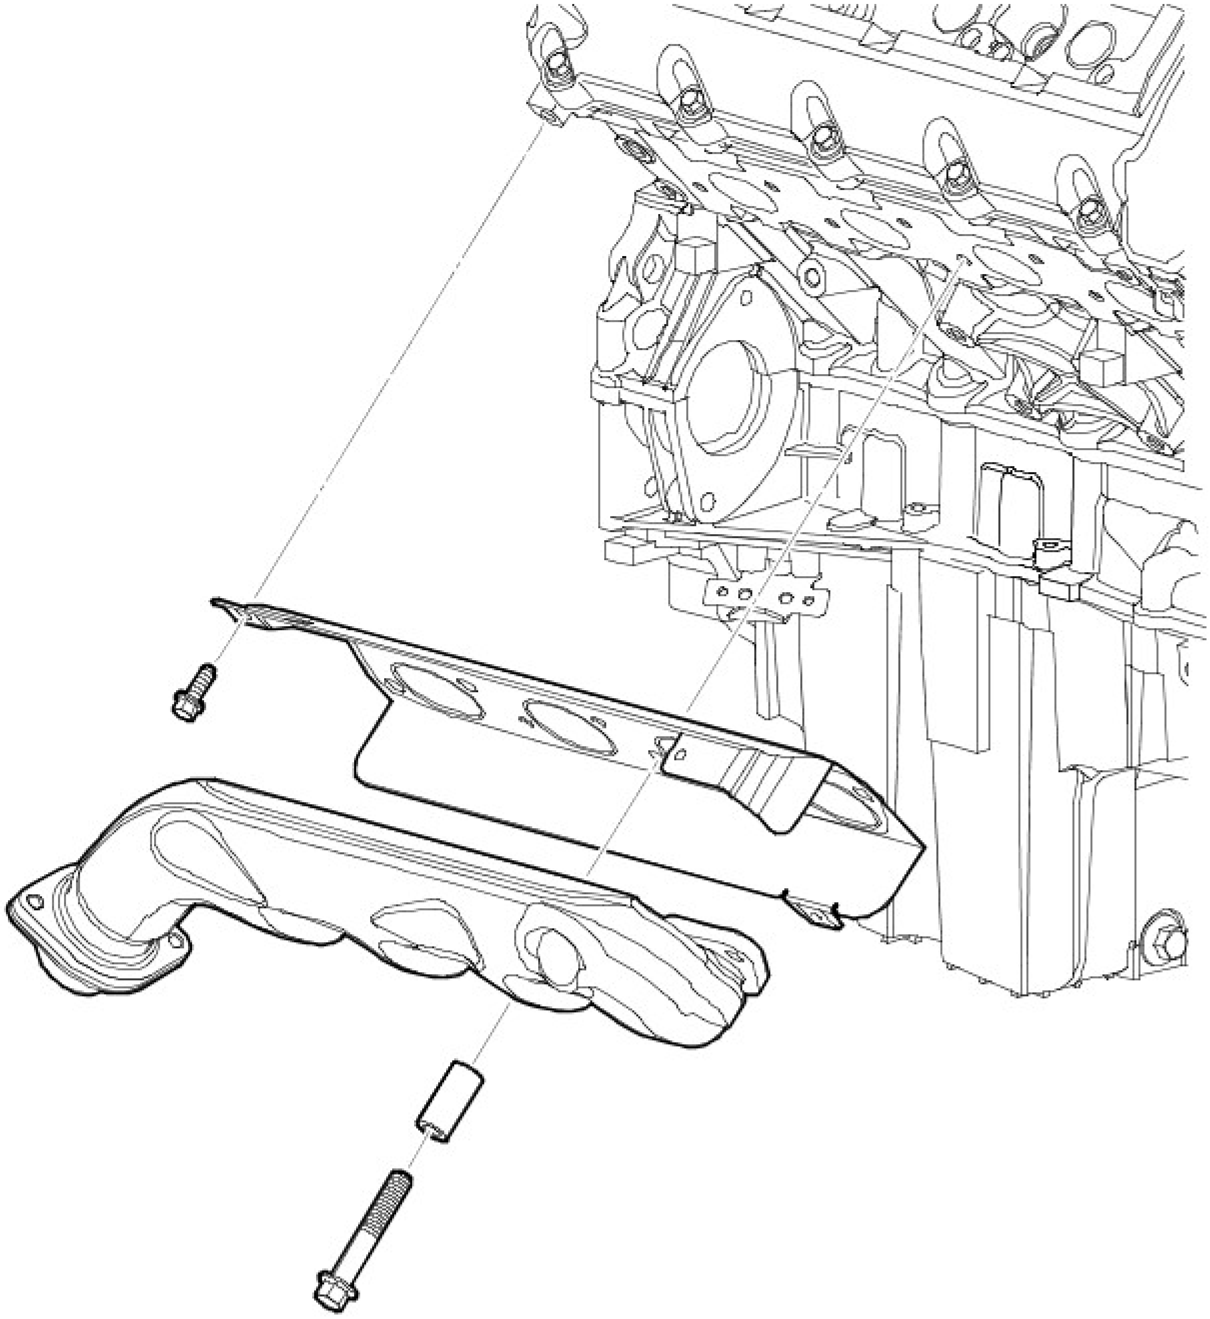
Oil Level Gage



Item	Part Number	Description
1	-	Oil level gage

The oil level gage locates along the left side of the oil pan, supported in a tube installed in the sump. Two holes in the end of the gage indicate the minimum and maximum oil levels. There is a difference of approximately 1.5 liters (1.58 US quart) between the two levels.

EXHAUST MANIFOLD



E43459

The fabricated stainless steel twin skin exhaust manifolds are unique for each cylinder bank.

Spacers on the securing bolts allow the manifolds to expand and retract with changes of temperature while maintaining the clamping loads.

Heat shields are integrated into the exhaust manifold gaskets.

Installation

1. Install the crankshaft sprocket.

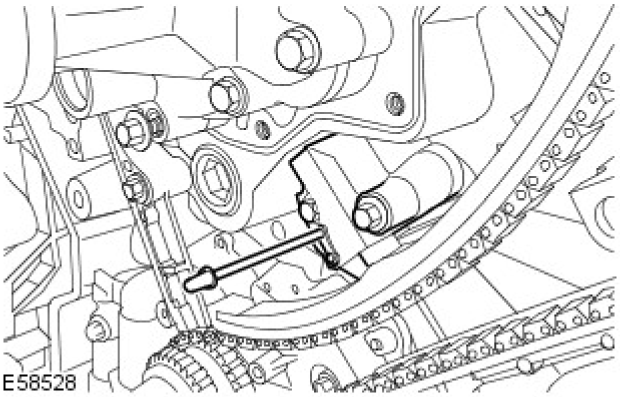
- Install the crankshaft sprocket key.

2. Install the LH primary timing chain.

- Make sure the timing chain slack is on the tensioner side of the timing chain.

3. Install the LH primary timing chain tensioner guides.

- Tighten the bolts to 12 Nm (9 lb.ft).



4. ⚠ CAUTION: During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Install the LH primary timing chain tensioner.

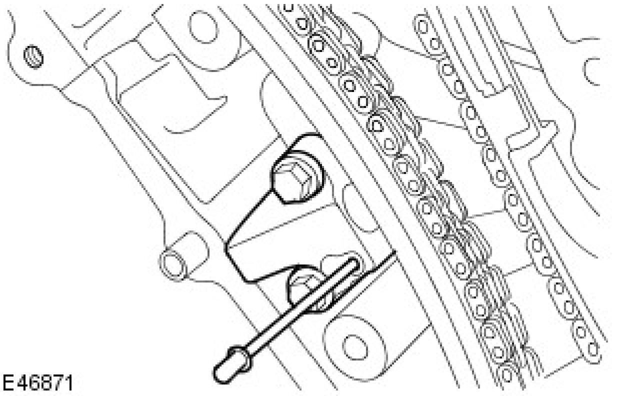
- Using 3 mm diameter metal rod, retain the chain tensioner piston.
- Tighten the bolts to 12 Nm (9 lb.ft).
- Remove the retaining rod.

5. Install the RH primary timing chain.

- Make sure the timing chain slack is on the tensioner side of the timing chain.

6. Install the RH primary timing chain tensioner guide.

- Tighten the bolts to 12 Nm (9 lb.ft).



7. ⚠ CAUTION: During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Install the RH primary timing chain tensioner.

- Using 3 mm diameter metal rod, retain the chain tensioner piston.
- Tighten the bolts to 12 Nm (9 lb.ft).
- Remove the retaining rod.

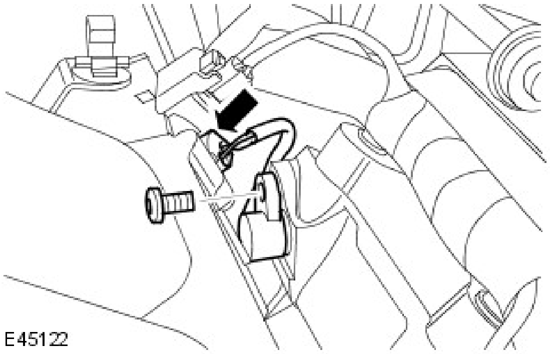
- Disconnect the electrical connector.



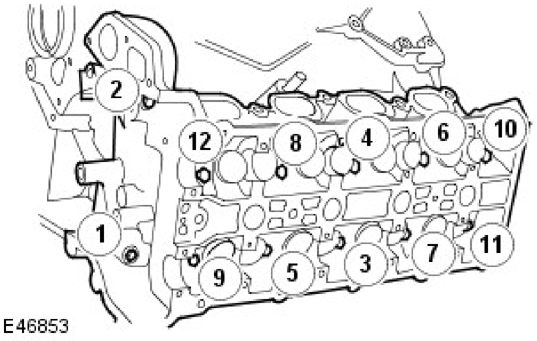
5. CAUTIONS:

⚠ The bolts can only be used twice, mark the bolts with a center punch. If two punch marks are visible, discard the bolts.

⚠ Vehicles fitted with Polydrive cylinder head bolts, the cylinder head bolts must be removed using a 10 mm Polydrive socket or a 10 mm Allen key. Failure to follow this instruction may result in damage to the component.

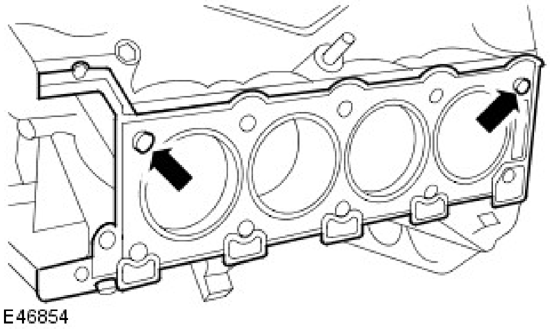
• NOTE: Remove the bolts in the indicated sequence.

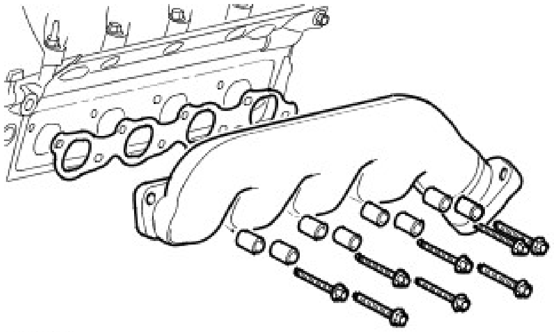
Remove the 12 cylinder head bolts.



6. With assistance remove the cylinder head.

7. Remove and discard the cylinder head gasket.





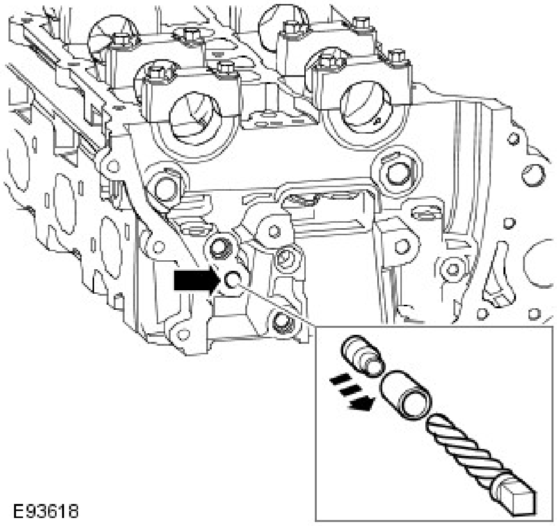
E48399

8. NOTE: Do not disassemble further if the component is removed for access only.

Remove the exhaust manifold.

- Remove the 8 bolts.
- Discard the gasket and the bolts.

Installation



E93618

1. CAUTIONS:

⚠ If a new cylinder head is to be installed to a vehicle with variable valve timing (VVT), the cylinder head must have the oil gallery blind rivet removed before installation.

⚠ Make sure that all debris and foreign material is removed from the cylinder head and cylinder head oil gallery.

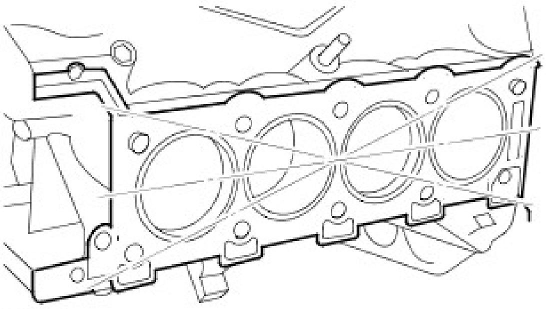
• NOTE: The centre bore of the blind rivet is 6 mm (0.24 inch) diameter.

Vehicles fitted with VVT: remove the blind rivet from the VVT oil gallery.

- Identify the VVT oil supply gallery and the 8 mm (0.31 inch) blind rivet.
- Using a suitable 3 mm (0.12 inch) punch release the centre of the blind rivet until it is released from the outer part of the blind rivet.
- Using a suitable extraction tool, remove the remaining part of the blind rivet.

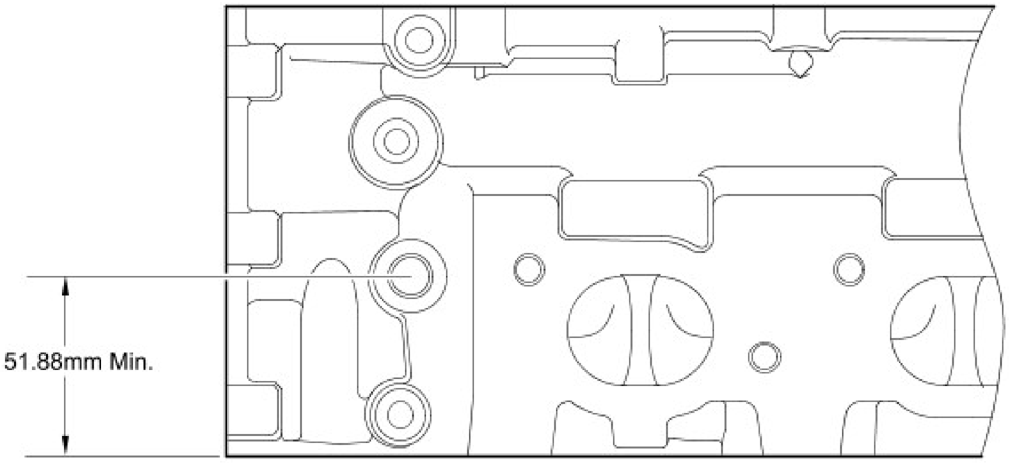
2. Clean the component mating faces.

3. Check cylinder head face for distortion, across the center and from corner to corner.
For additional information, refer to: Specifications (303-01A Engine - V8 S/C 4.2L Petrol, Specifications).



E46855

4. For cylinder head face distortion data, refer to specifications.
For additional information, refer to: Specifications (303-01A Engine - V8 S/C 4.2L Petrol, Specifications).



E100333

5. NOTE: For cylinder head with distortion above the maximum allowance, the cylinder head material must be measured.

Measure the cylinder head material.

- Check measurement from the centre of the exhaust dowel to the cylinder head face as shown.
- If the measurement is less than 51.88 mm the cylinder head requires replacement.

6. Install the exhaust manifold.

- Clean the component mating faces.
- Install a new gasket.
- Tighten the bolts to 20 Nm (15 lb.ft).

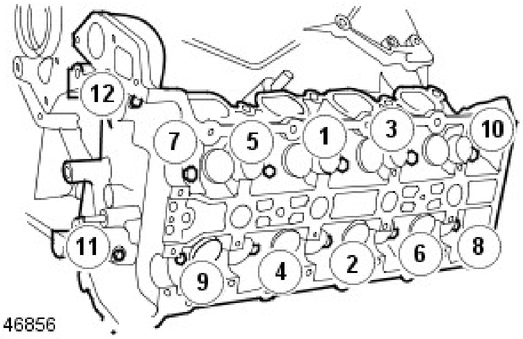
7. ⚠CAUTION: The head gasket must be installed over the cylinder block dowels.

Install a new cylinder head gasket.

- Clean the cylinder head locating dowels.

8. With assistance install the cylinder head.

9. NOTE: Note: Tighten the bolts 1 to 12 in the sequence shown.



E46856

Install the cylinder head bolts.

- Lubricate the new cylinder head bolt threads with clean engine oil.
- Tighten the bolts to 20 Nm (15 lb.ft).
- Tighten the bolts to 35 Nm (26 lb.ft).
- Tighten the bolts 1 to 10, a further 90 degrees.
- Tighten the bolts 1 to 10, a further 90 degrees.
- Tighten the M8 bolts 11 and 12, to 25 Nm (18 lb.ft).

10. Install the CMP sensor.

- Tighten the Torx screw to 7 Nm (5 lb.ft).
- Connect the electrical connector.

11. Install the LH bank camshafts.

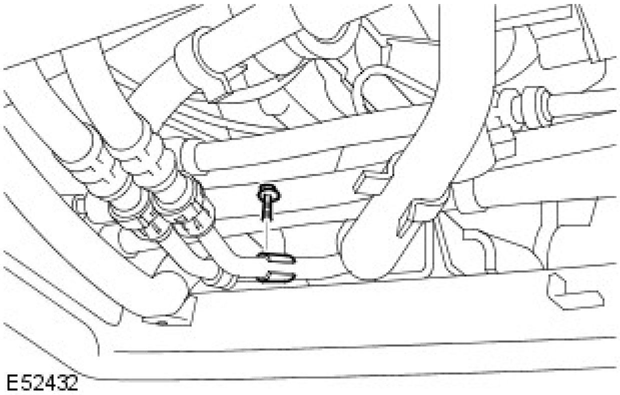
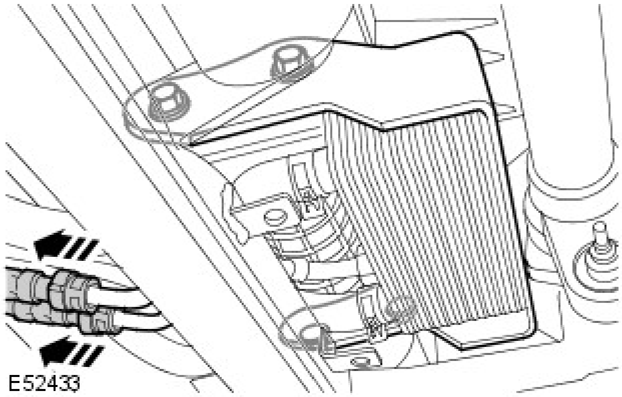
5. Remove the oil cooler pipe support bracket.



- Remove the bolt.

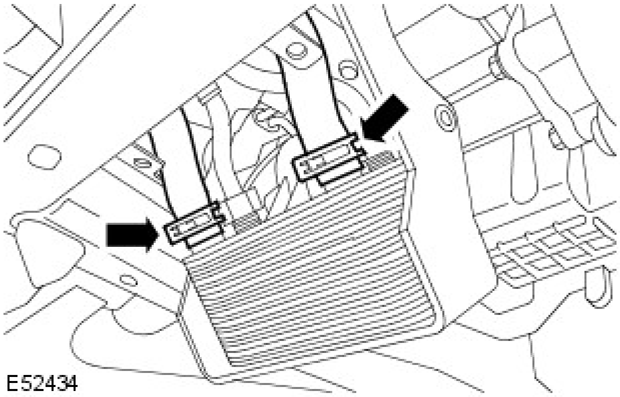


6. ⚠ CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Some fluid spillage is inevitable during this operation.

Release the oil cooler.

- Using the special tool, disconnect the oil cooler hoses.
- Remove the 4 bolts.



7. Disconnect the coolant hoses.

- Position a container to collect the fluid spillage.
- Clamp the relevant hoses, to minimise the coolant loss.
- Release the 2 clips.

Installation

1. Connect the coolant hoses.

- Clean the component mating faces.
- Secure the clips.
- Remove the hose clamps.

2. Install the oil cooler.

- Clean the component mating faces.
- Install the 4 bolts and tighten to 10 Nm (7 lb.ft).
- Connect the hoses.

3. Install the oil cooler pipe support bracket.

- Tighten the bolt to 10 Nm (7 lb.ft).

4. Install the radiator access panel.

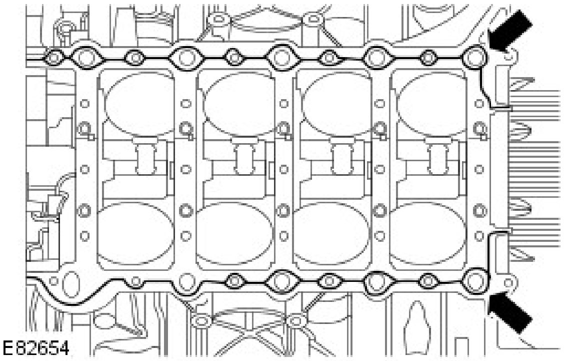
1. CAUTIONS:

⚠ Use only a plastic scraper when removing the sealing material.

⚠ If any new bolts are to be installed to retain the crankshaft main bearing carrier, pre-stress the retaining bolts by installing the crankshaft main bearing carrier without any sealant and tightening the new retaining bolts to the specified torque. Remove the crankshaft main bearing carrier once the bolts have been pre-stressed. Failure to follow this instruction may result in damage to the vehicle.

Clean all the mating faces and reusable parts thoroughly and check for damage.

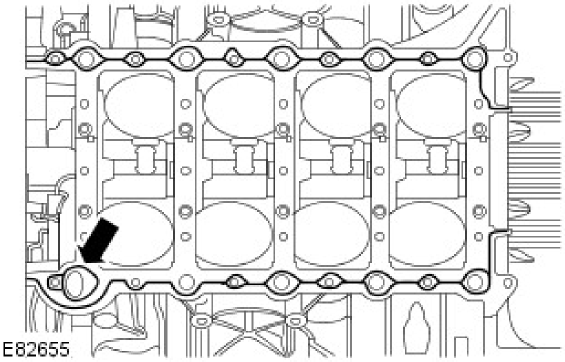


E82654

2. NOTE: Install the crankshaft main bearing carrier and tighten bolts to specification within twenty minutes of applying the sealant.

Apply a 2 mm (0.08in) bead of sealant to the cylinder block in the area shown.

- Use WSS-M4G323-A4-RTV sealant.

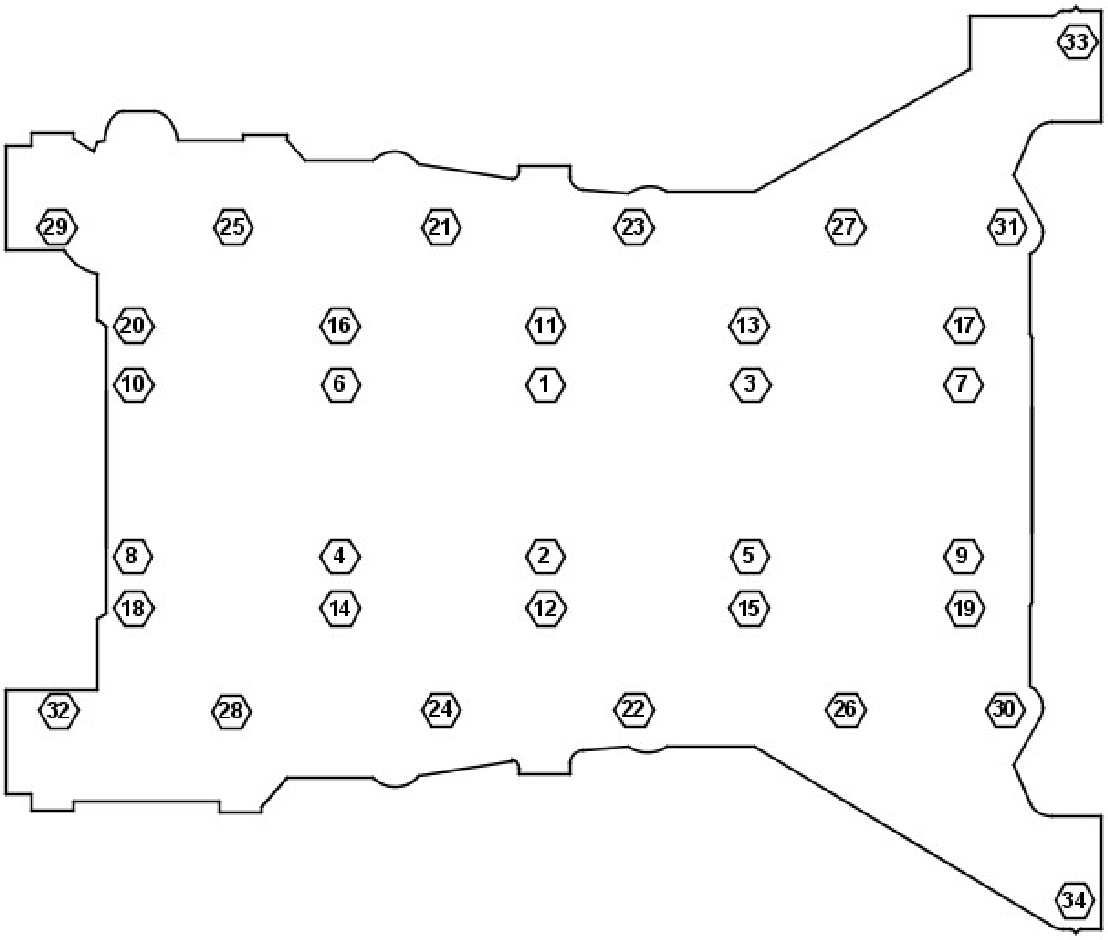


E82655

3. NOTE: Install the crankshaft main bearing carrier and tighten bolts to specification within twenty minutes of applying the sealant.

Apply a 1 mm (0.039in) bead of sealant to the cylinder block in the area shown.

- Use WSS-M4G323-A4-RTV sealant.



VUJ0002450

4. ⚠ CAUTION: Make sure all dowels are fully seated into the crankshaft main bearing carrier prior to tightening the bolts.

- NOTE: Do not lubricate the crankshaft main bearing carrier retaining bolts.

- NOTE: Do not rotate the crankshaft until all the retaining bolts are tightened to specification.

- NOTE: The retaining bolts must be tightened within twenty minutes of applying the sealant.

- NOTE: Tighten the retaining bolts in the sequence shown.

Install the crankshaft main bearing carrier to the cylinder block.

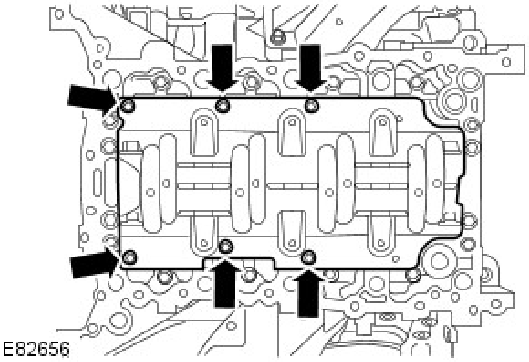
1. Stage 1: Bolts 21 to 32, tighten to 15 Nm (11 lb.ft).
2. Stage 2: Bolts 33 to 34, tighten to 15 Nm (11 lb.ft).
3. Stage 3: Bolts 1 to 10, tighten to 25 Nm (18 lb.ft).
4. Stage 4: Bolts 11 to 20, tighten to 15 Nm (11 lb.ft).
5. Stage 5: Bolts 1 to 10, tighten to 35 Nm (26 lb.ft), then a

further 135 degrees.

6. Stage 6: Bolts 11 to 20, tighten to 20 Nm (15 lb.ft), then a further 150 degrees.
7. Stage 7: Bolts 21 to 32, tighten to 20 Nm (15 lb.ft), then a further 90 degrees.
8. Stage 8: Bolts 33 to 34, tighten to 20 Nm (15 lb.ft), then a further 150 degrees.
9. Stage 9: Center punch each of the bolt heads to indicate it has been reused.

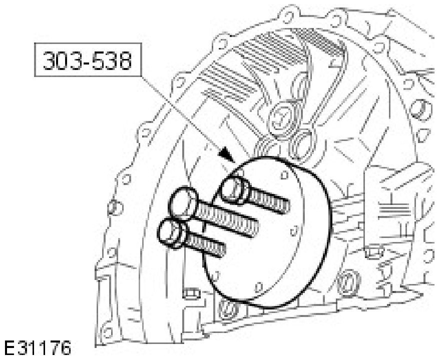
5. Rotate the crankshaft to check correct operation.

6. Remove excess sealant which may squeeze out at the front cover sealing surfaces.



7. Install the baffle plate.

- Tighten the 6 bolts to 6 Nm (4 lb.ft).

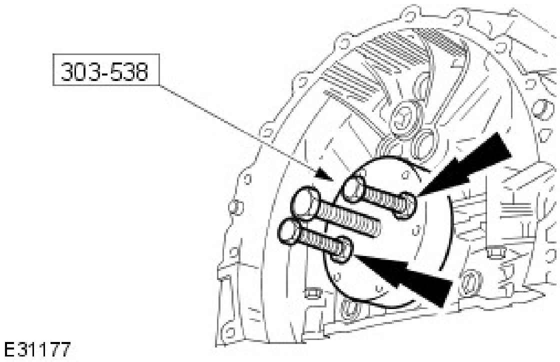


8. NOTE: Carefully remove the transit sleeve, leaving the seal in place.

• NOTE: Make sure that the transit sleeve is correctly positioned and install the new seal over the crankshaft. Do not use any lubricant on the seal, the transit sleeve or the crankshaft.

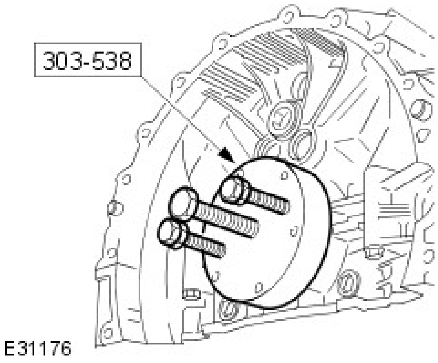
Using the special tool, position the crankshaft rear oil seal.

- Install the special tool to the crankshaft.



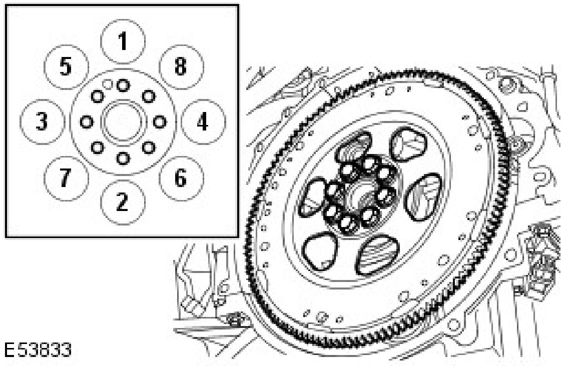
9. ⚠CAUTION: Alternate the nut tightening to correctly seat the crankshaft rear oil seal.

Using the special tool, install the rear crankshaft oil seal.



10. ⚠CAUTION: Make sure that the crankshaft rear oil seal is correctly located.

Remove the special tool.

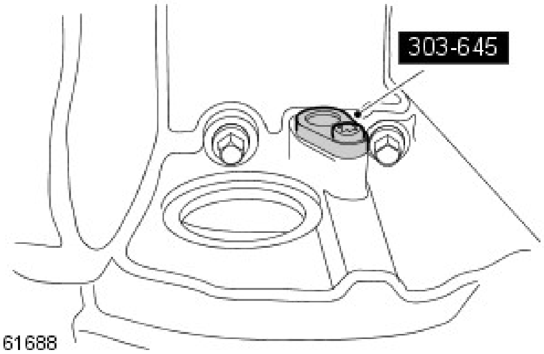


11. NOTE: Prevent the flexplate from rotating.

Install the torque converter flexplate.

- Clean the component mating faces.
- Tighten the bolts evenly in 2 stages to the sequence shown.
- Tighten the bolts to 15 Nm (11 lb ft).
- Tighten the bolts to 110 Nm (81 lb.ft).

12. Install the special tool.



E61688

13. NOTE: Install a new gasket.

Install the oil pump assembly.

- Clean the component mating faces.
- Install the gasket.
- Tighten the bolts to 10 Nm (7 lb.ft).

14. NOTE: Install a new O-ring seal.

Install the oil strainer pick-up assembly.

- Install the O-ring seal.
- Tighten the M6 bolt to 10 Nm (7 lb.ft).
- Apply sealant to the M5 bolts.
- Tighten the M5 bolts to 6 Nm (4 lb.ft).

15. Install the crankshaft sprocket.

- Clean the component mating faces.
- Install the crankshaft sprocket key.

16. Install the LH primary timing chain.

- Make sure the timing chain slack is on the tensioner side of the timing chain.

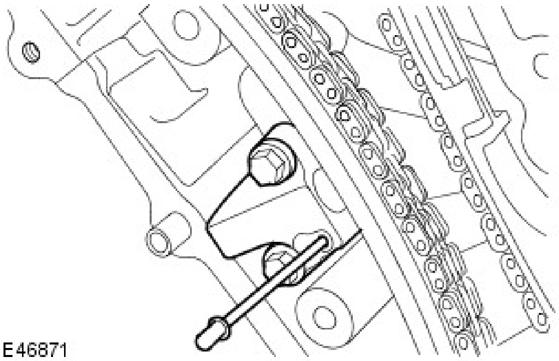
17. Install the LH primary timing chain tensioner guides.

- Tighten the bolts to 12 Nm (9 lb.ft).

18. ⚠ CAUTION: During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Install the LH primary timing chain tensioner.

- Using a 3 mm (0.118 in) diameter rod, retain the chain tensioner piston.
- Tighten the bolts to 12 Nm (9 lb.ft).
- Remove the retaining rod.



E46871

19. ⚠ CAUTION: Make sure that new bolts are installed.

• NOTE: Install new O-ring seals.

Install the LH VCT control solenoid housing.

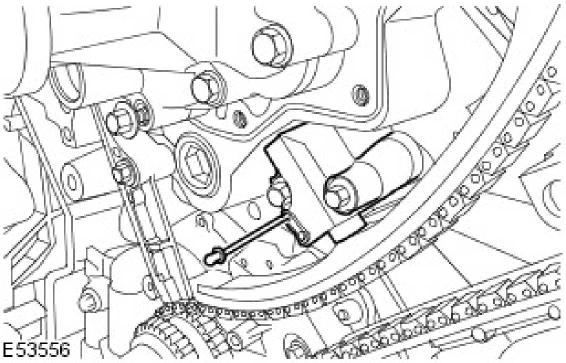
- Install the O-ring seals.
- Tighten the bolts to 22 Nm (16 lb.ft).
- Tighten the nut to 10 Nm (7 lb.ft).

20. Install the RH primary timing chain.

- Make sure the timing chain slack is on the tensioner side of the timing chain.

21. Install the RH primary timing chain tensioner guide.

- Tighten the bolts to 12 Nm (9 lb.ft).



22. ⚠ CAUTION: During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Install the RH primary timing chain tensioner.

- Using a 3 mm (0.118 in) diameter rod, retain the chain tensioner piston.
- Tighten the bolts to 12 Nm (9 lb.ft).
- Remove the retaining rod.

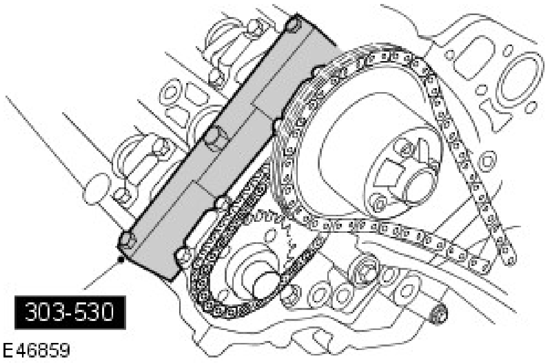
23. ⚠ CAUTION: Make sure that new bolts are installed.

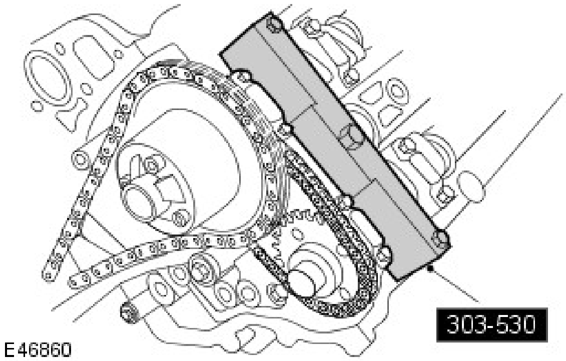
• NOTE: Install new O-ring seals.

Install the RH VCT control solenoid housing.

- Install the O-ring seals.
- Tighten the bolts to 22 Nm (16 lb.ft).
- Tighten the nut to 10 Nm (7 lb.ft).

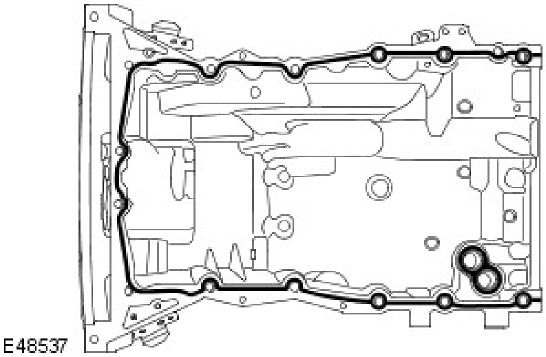
24. Remove the special tool from the RH cylinder head.





303-530
E46860

25. Remove the special tool from the LH cylinder head.



26. Install the oil pan extension.

- Clean the component mating faces.
- Apply a 3 mm (0.118 in) diameter bead of sealant, to the area indicated.
- Install the bolts, but do not tighten fully at this stage.

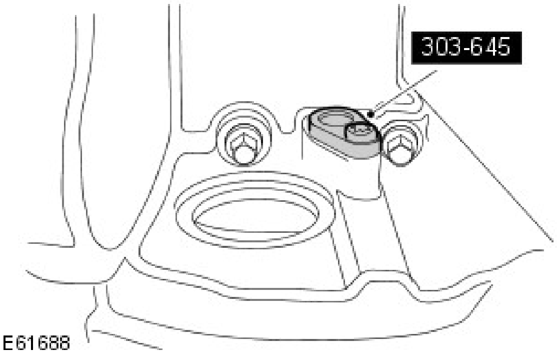
27. Tighten the oil pan bolts in the sequence shown to 20 Nm (15 lb.ft).



28. Remove the special tool.

- Remove the bolt.

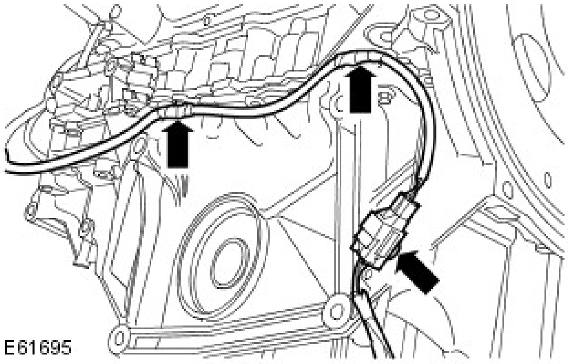
29. Install the CKP sensor.

- Tighten the bolt to 8 Nm (6 lb.ft)

30. NOTE: Install a new O-ring seal.

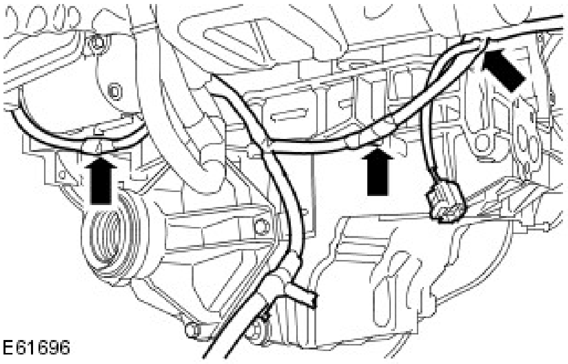
Install the halfshaft support bearing housing.

- Install the O-ring seal.
- Lubricate the O-ring seal with a suitable lubricant.
- Tighten the bolts evenly to 25 Nm (18 lb.ft).



31. Attach the wiring harness to the LH side of the engine

- Secure the clips.

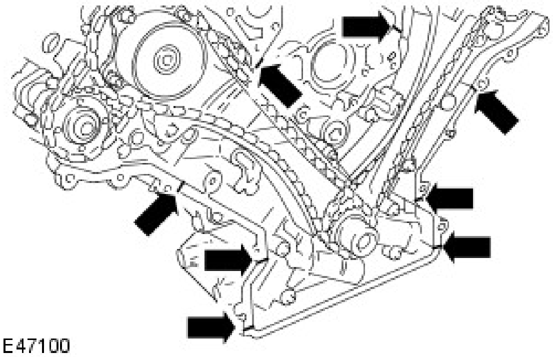


32. Attach the wiring harness to the RH side of the engine.

- Secure the clips.

33. Install the power steering pump mounting bracket.

- Tighten the bolts to 25 Nm (18 lb.ft).



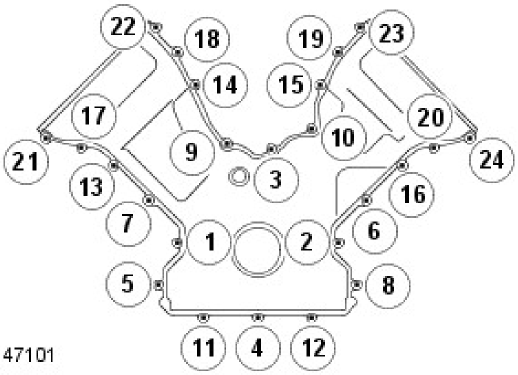
E47100

34. NOTE: Install a new gasket.

• NOTE: Install a new O-ring seal.

Install the engine front cover.

- Clean the component mating faces.
- Apply a 3 mm (0.118 in) diameter bead of sealant 12mm (0.47 in) long, to the 8 places indicated.
- Install the gasket.
- Install the O-ring seal.



E47101

35. Evenly and progressively tighten the bolts in the sequence shown to 12 Nm (9 lb.ft).

36. Attach the engine wiring harness.

- Secure the clips.
- Tighten the bolt to 10 Nm (7 lb.ft).

37. NOTE: Install new seals.

Install the LH valve cover plug aperture seals.

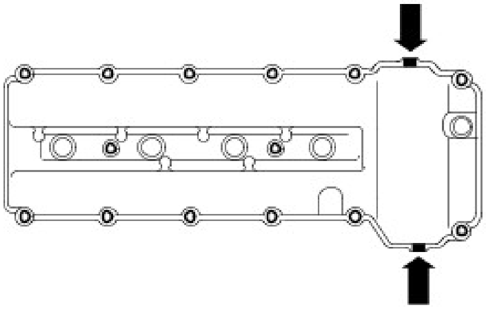
38. Install new LH valve cover bolt O-ring seals.

39. NOTE: Install a new gasket.

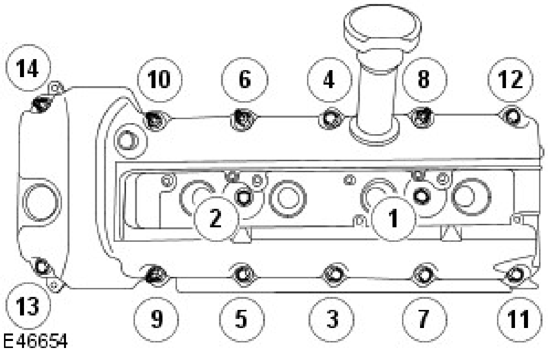
• NOTE: Apply two beads of silicone gasket sealant as shown on the illustration. The application of the sealant must be 3 mm (0.118 in) diameter 12 mm (0.47 in) long. Install the valve cover immediately after applying the sealant. The cover should be fitted directly to the head without smearing the sealant or the seals.

Install the LH valve cover.

- Clean the component mating faces.
- Install the valve cover gasket.



E49922



40. Install the LH valve cover bolts.

- Install the LH valve cover bolts to the positions previously noted.
- Tighten the bolts in the sequence shown to 12 Nm (9 lb.ft).

41. Connect the LH VCT oil solenoid electrical connector.

42. Attach the engine wiring harness to the retaining bracket.

43. NOTE: Install a new O-ring seal.

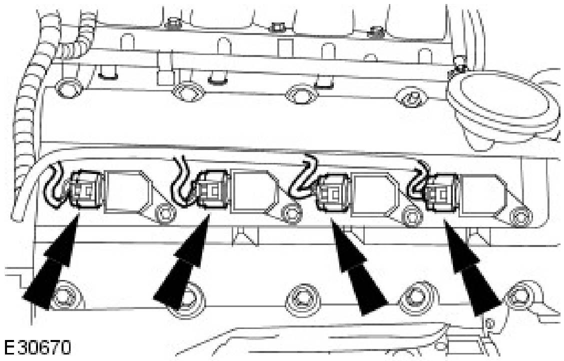
With assistance, install the oil level indicator and tube.

- Clean the component mating faces.
- Install the O-ring seal.
- Lubricate the O-ring seal with clean engine oil.
- Tighten the nut to 6 Nm (4 lb.ft).

44. NOTE: Install new O-ring seals.

Install the 4 LH ignition coil-on-plugs.

- Install the O-ring seals.
- Install the 4 ignition coil-on-plugs.
- Tighten the bolts to 6 Nm (4 lb.ft).



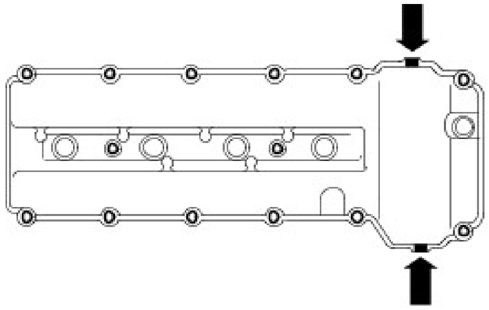
45. Connect the 4 electrical connectors.

46. Install the LH ignition coil-on-plug cover.

47. NOTE: Install new seals.

Install new RH valve cover plug aperture seals.

48. Install new RH valve cover bolt O-ring seals.



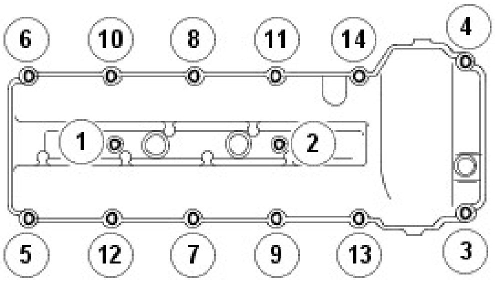
E49922

49. NOTE: Install a new gasket.

• NOTE: Apply two beads of silicone gasket sealant as shown on the illustration. The application of the sealant must be 3 mm (0.118 in) diameter 12 mm (0.47 in) long. Install the valve cover immediately after applying the sealant. The cover should be fitted directly to the head without smearing the sealant or the seals.

Install the RH valve cover.

- Clean the component mating faces.
- Install the gasket.



E46679

50. Install the RH valve cover bolts.

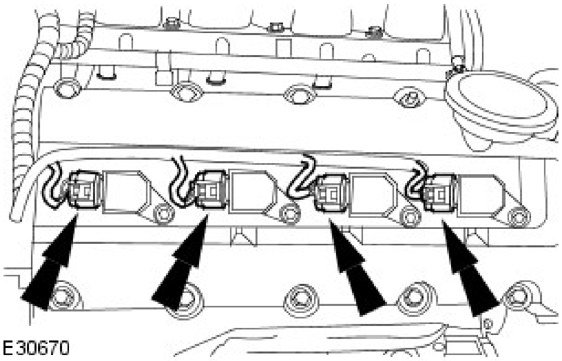
- Install the RH valve cover bolts to the positons previously noted.
- Tighten the bolts in the sequence shown to 12 Nm (9 lb.ft).

51. NOTE: Install new O-ring seals.

Install the 4 RH ignition coil-on-plugs.

- Install the O-ring seals.
- Install the 4 ignition coil-on-plugs.
- Tighten the bolts to 6 Nm (4 lb.ft).

52. Connect the 4 electrical connectors.



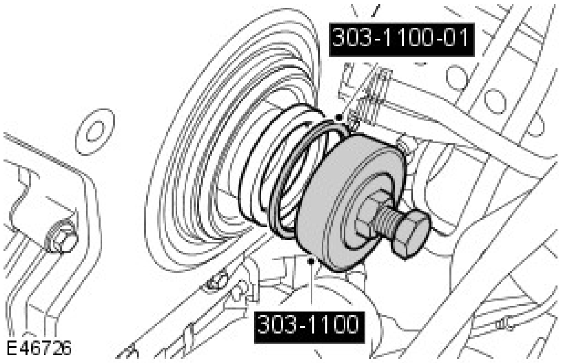
E30670

53. Connect the RH VCT oil solenoid electrical connector.

54. Attach the engine wiring harness to the retaining bracket.

55. Connect the PCV line to the RH valve cover.

56. Clean the crankshaft pulley mating faces.



57. Using the special tool, install the crankshaft front seal.

- Lubricate the seal with clean engine oil.
- Use the discarded crankshaft bolt with the special tool.
- Remove the special tools.

58. Install the crankshaft pulley.

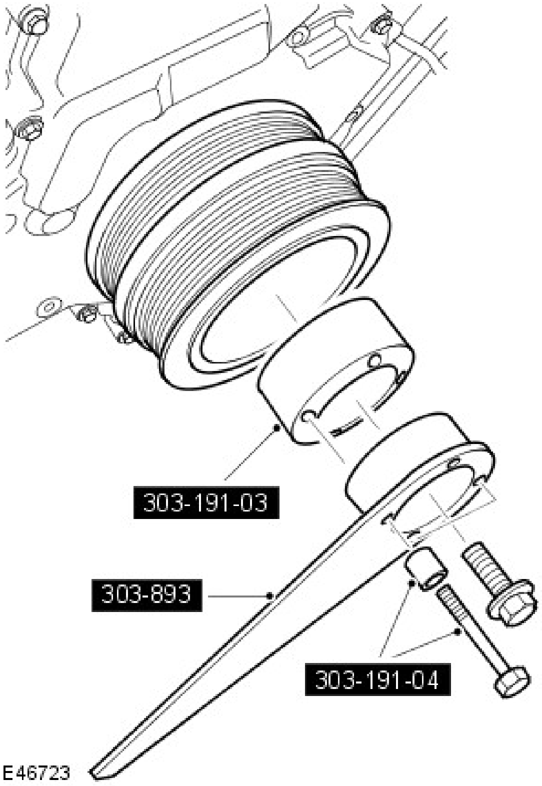
- Lubricate the seal with clean engine oil.

59. Install the crankshaft pulley locking ring.

60. ⚠ CAUTION: The screw thread in the crankshaft pulley must be cleaned out before installing a new crankshaft pulley bolt.

Install, but do not tighten, the new crankshaft pulley bolt.

61. ⚠ CAUTION: Under no circumstances should the crankshaft setting peg, 303-645, be used in the following operations, to restrain the crankshaft.



Using the special tools, tighten the crankshaft pulley bolt.

- Tighten the crankshaft pulley bolt to 380 Nm (280 lb.ft).
- Remove the special tools.

62. Install the exhaust manifold heat shield.

- Tighten the 2 bolts.

63. Install the accessory drive belt idler pulleys.

- Tighten the bolts to 25 Nm (18 lb.ft).

64. Install the coolant pump pulley.

- Tighten the bolts to 10 Nm (7 lb.ft).

65. NOTE: Install new O-ring seals.

Install the coolant manifold.

- Clean the components.
- Install the O-ring seals.
- Connect the 4 coolant hoses and install the clips.
- Attach the wiring harness bracket.
- Tighten the 2 bolts to 10 Nm (7 ib.ft).

66. Connect the ECT sensor electrical connector.

67. Install the cooling fan drive belt tensioner.

- Tighten the bolt to 40 Nm (30 lb.ft).

68. Remove the engine from the engine stand.

69. Install the engine.

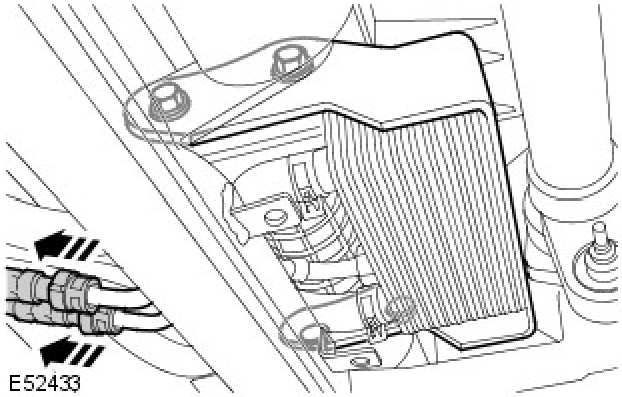
20. Remove the oil cooler pipe support bracket.

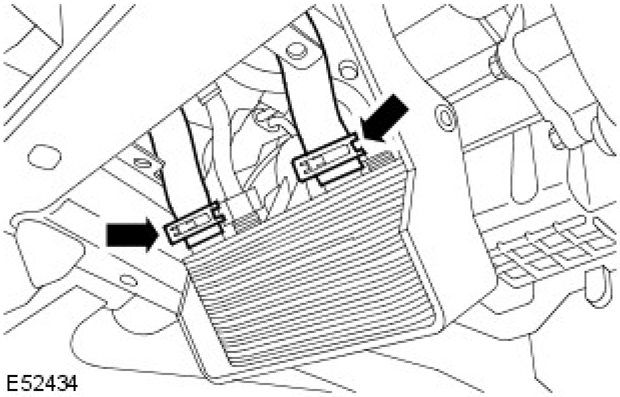
- Remove the bolt.



21. ⚠ CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

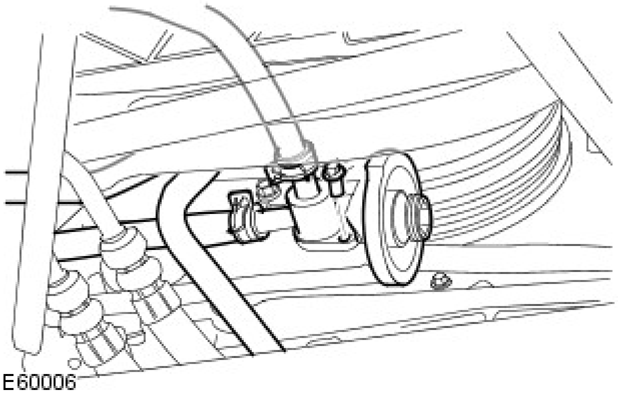
Release the oil cooler.

- Disconnect the oil cooler hoses.
- Remove the 4 bolts.



22. Disconnect the engine oil cooler coolant hoses.

- Position a container to collect the fluid spillage.
- Clamp the relevant hoses, to minimise the coolant loss.
- Release the 2 clips.



23. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Release and tie aside the oil filter housing.

- Remove the oil union bolt for access.
- Remove the 3 bolts.

24. Remove the LH charge air cooler.
For additional information, refer to: Charge Air Cooler (303-12A Intake Air Distribution and Filtering - V8 S/C 4.2L Petrol, Removal and Installation).

25. Remove the RH charge air cooler.

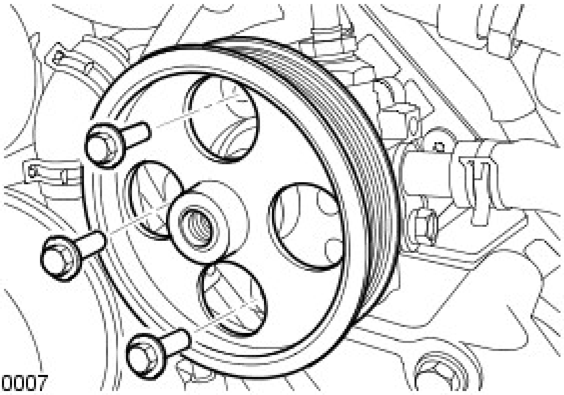
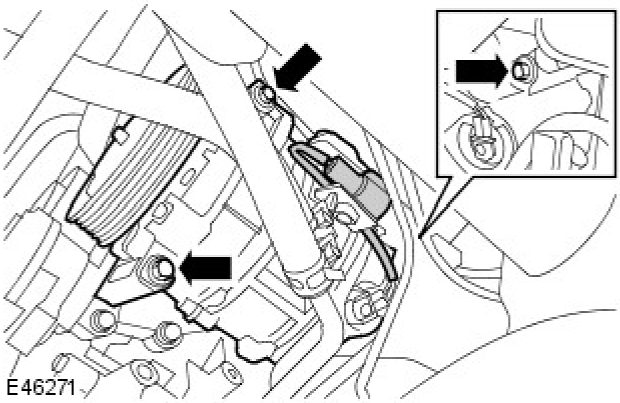
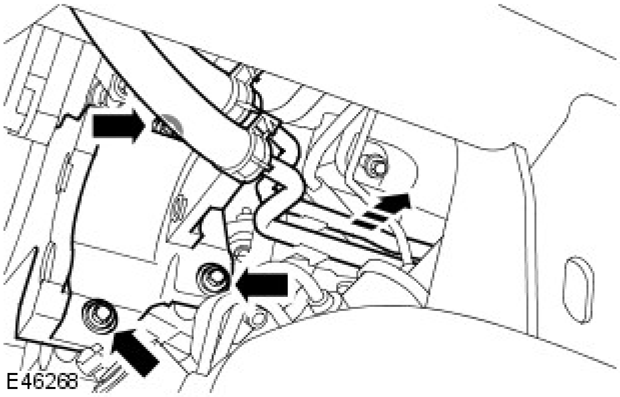
- Remove the 3 bolts.



27. Release the A/C compressor and tie aside.

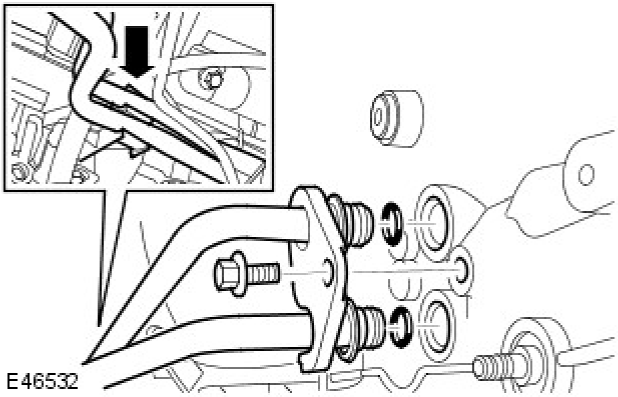
- Remove the 3 bolts.
- Disconnect the electrical connector.





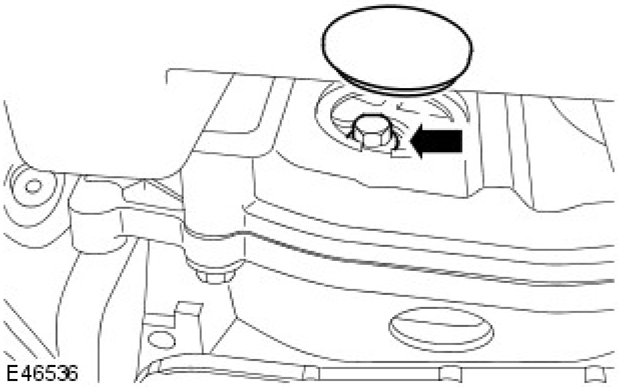
28. Remove the A/C compressor mounting bracket.

- Remove the 3 bolts.



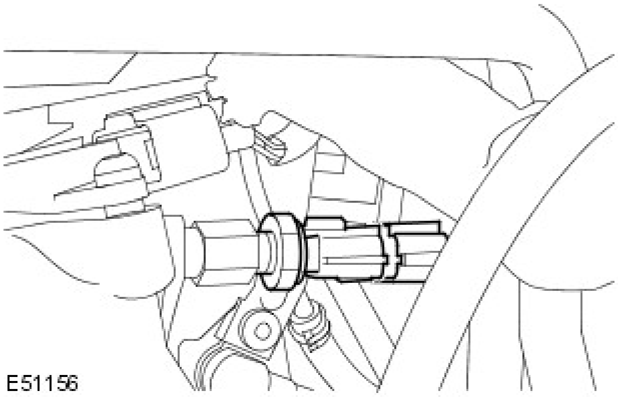
29. Release the transmission cooler pipes.

- Position a container to collect the fluid.
- Remove the bolt.
- Release the 2 clips.
- Move the transmission pipes aside.



30. Release the flexplate.

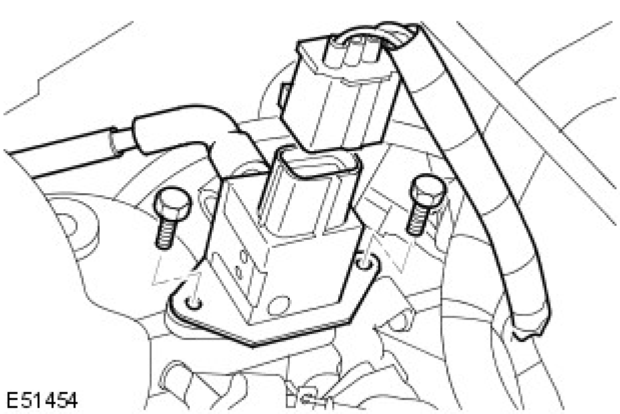
- Remove the grommet.
- Rotate the crankshaft to access the retaining bolts.
- Remove the 3 bolts.



31. WARNING: The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

Remove the fuel temperature sensor.

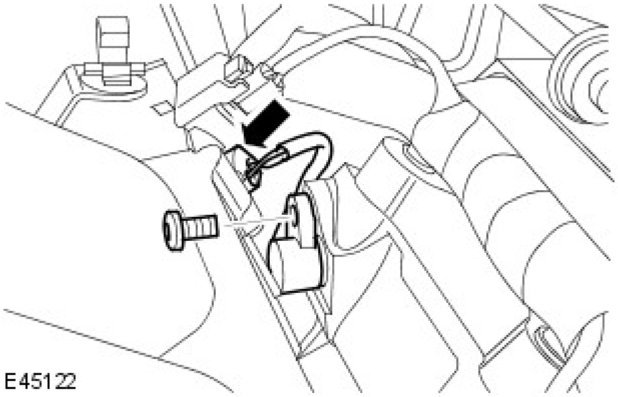
- Disconnect the electrical connector.
- Position an absorbent cloth to collect fluid spillage.



32. ⚠ CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

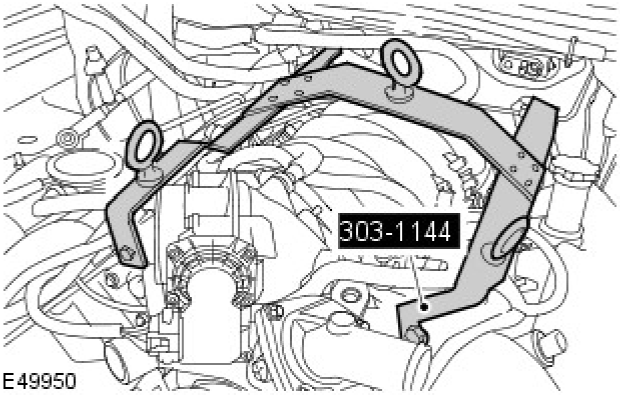
Remove the fuel rail pressure sensor.

- Remove the 2 bolts.
- Remove and discard the 2 O-ring seals.



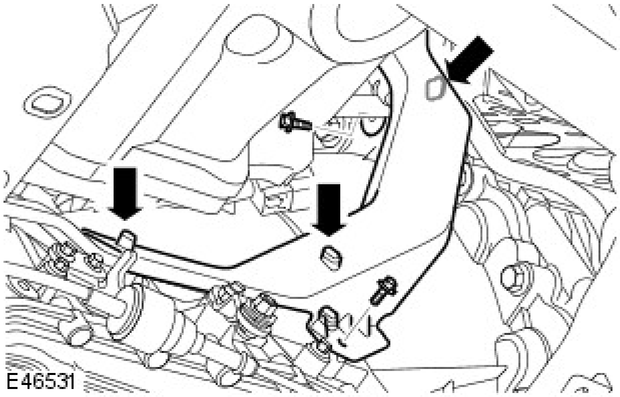
33. Remove both camshaft position (CMP) sensors and brackets for access.

- Remove the Torx screw.
- Release the harness brackets.



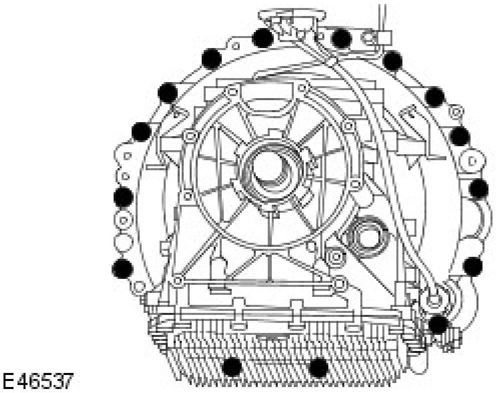
34. NOTE: Naturally aspirated illustrated, mounting points are identical on the supercharged engine.

Install the engine lifting cradle.



35. Release the heat shield for access to the transmission bolts.

- Remove the 2 bolts.
- Move the shield aside.



36. Remove the transmission bolts.

- Support the transmission.
- Remove the 16 bolts.

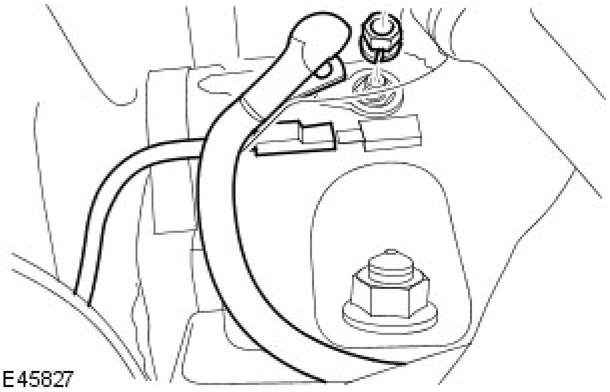
Remove the 2 engine mount nuts.

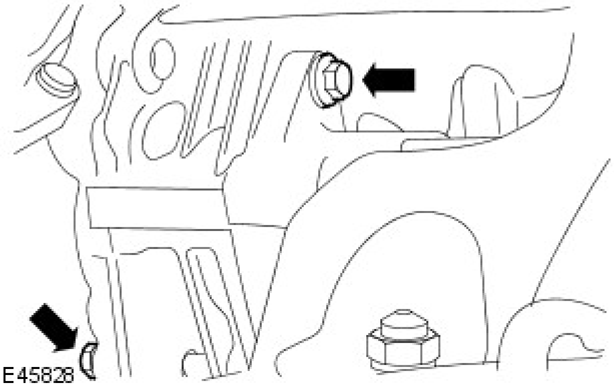
39. Release the engine from mounts and the transmission.

- Install the lifting chains.
- Raise the RH side of the engine by approximately 40 mm.



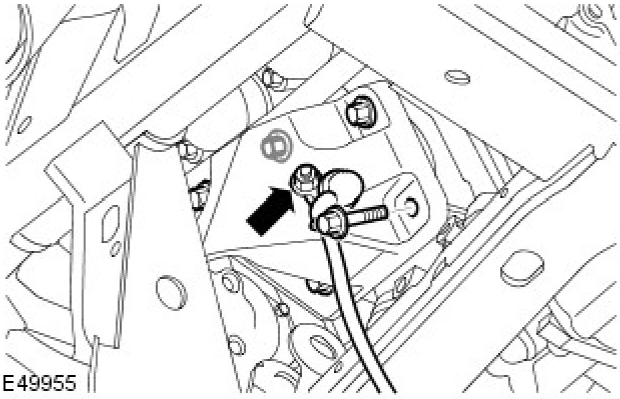
40. Disconnect the starter motor electrical connections.

- Remove the nut.



41. Remove the starter motor.

- Remove the starter motor retaining bolts.



42. CAUTIONS:

⚠ Make sure the torque converter remains connected to the transmission.

⚠ Care must be taken to avoid damaging the steering rack and differential.

Remove the engine front mount bracket.

- Remove 4 bolts securing the engine mount bracket to the cylinder block.
- Disconnect the engine ground cable from the RH mounting bracket.
- Carefully and progressively raise and remove the engine.

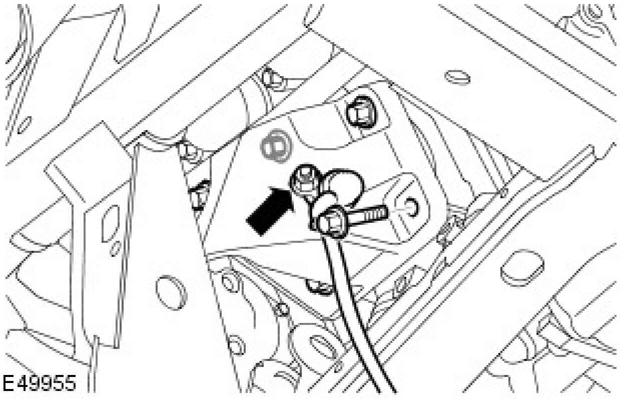
1. Install the engine lifting cradle.

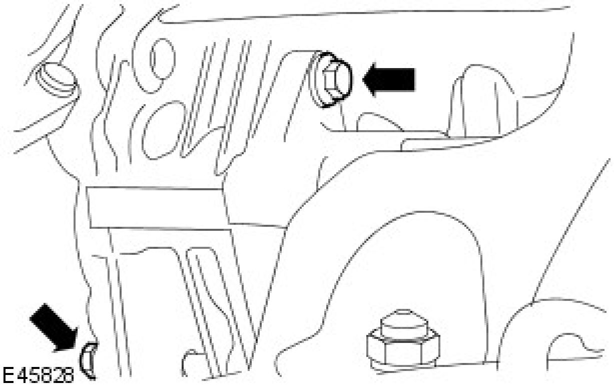
- Connect the lifting chains.

2. Carefully lower the engine until approximately 35mm above engine mounts.

3. Install the engine front mount bracket.

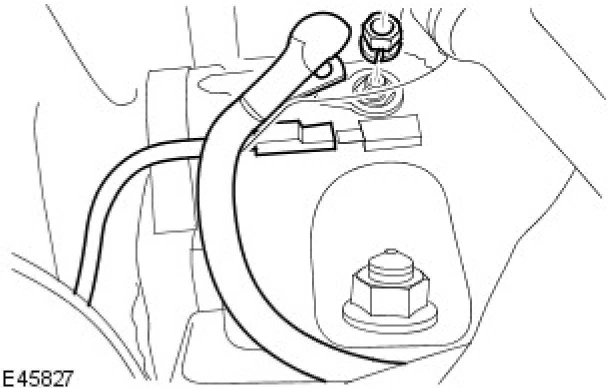


- Clean the component mating faces.
- Tighten the bolts to 45 Nm (33 lb.ft).
- Connect the engine ground cable and tighten the bolt to 25 Nm (18 lb.ft).



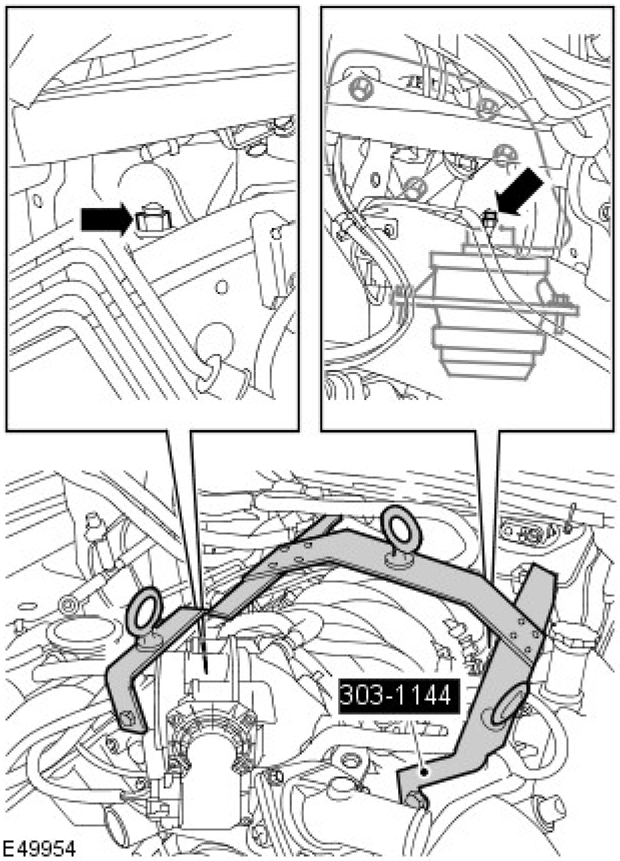
4. Install the starter motor.

- Tighten the bolts to 45 Nm (33 lb.ft).



5. Connect the starter motor electrical connectors.

- Connect and secure the electrical connectors.
- Tighten the starter motor nut to 10 Nm (7 lb.ft).



6. With assistance align the engine to the transmission and engine mounts.

- Tighten the engine mount nuts to 90 Nm (66 lb.ft).

8. Attach the flexplate to the torque converter.

- Rotate the crankshaft to access the retaining bolts.
- Tighten the bolts evenly and progressively in 2 stages.
- Tighten the bolts to 15 Nm (11 lb ft).
- Tighten the bolts to 110 Nm (81 lb.ft).
- Install the grommet.

9. Remove the engine lifting cradle.

10. Install the upper suspension arm and brake line heat shields.

- Tighten to 8 Nm (6 lb.ft)

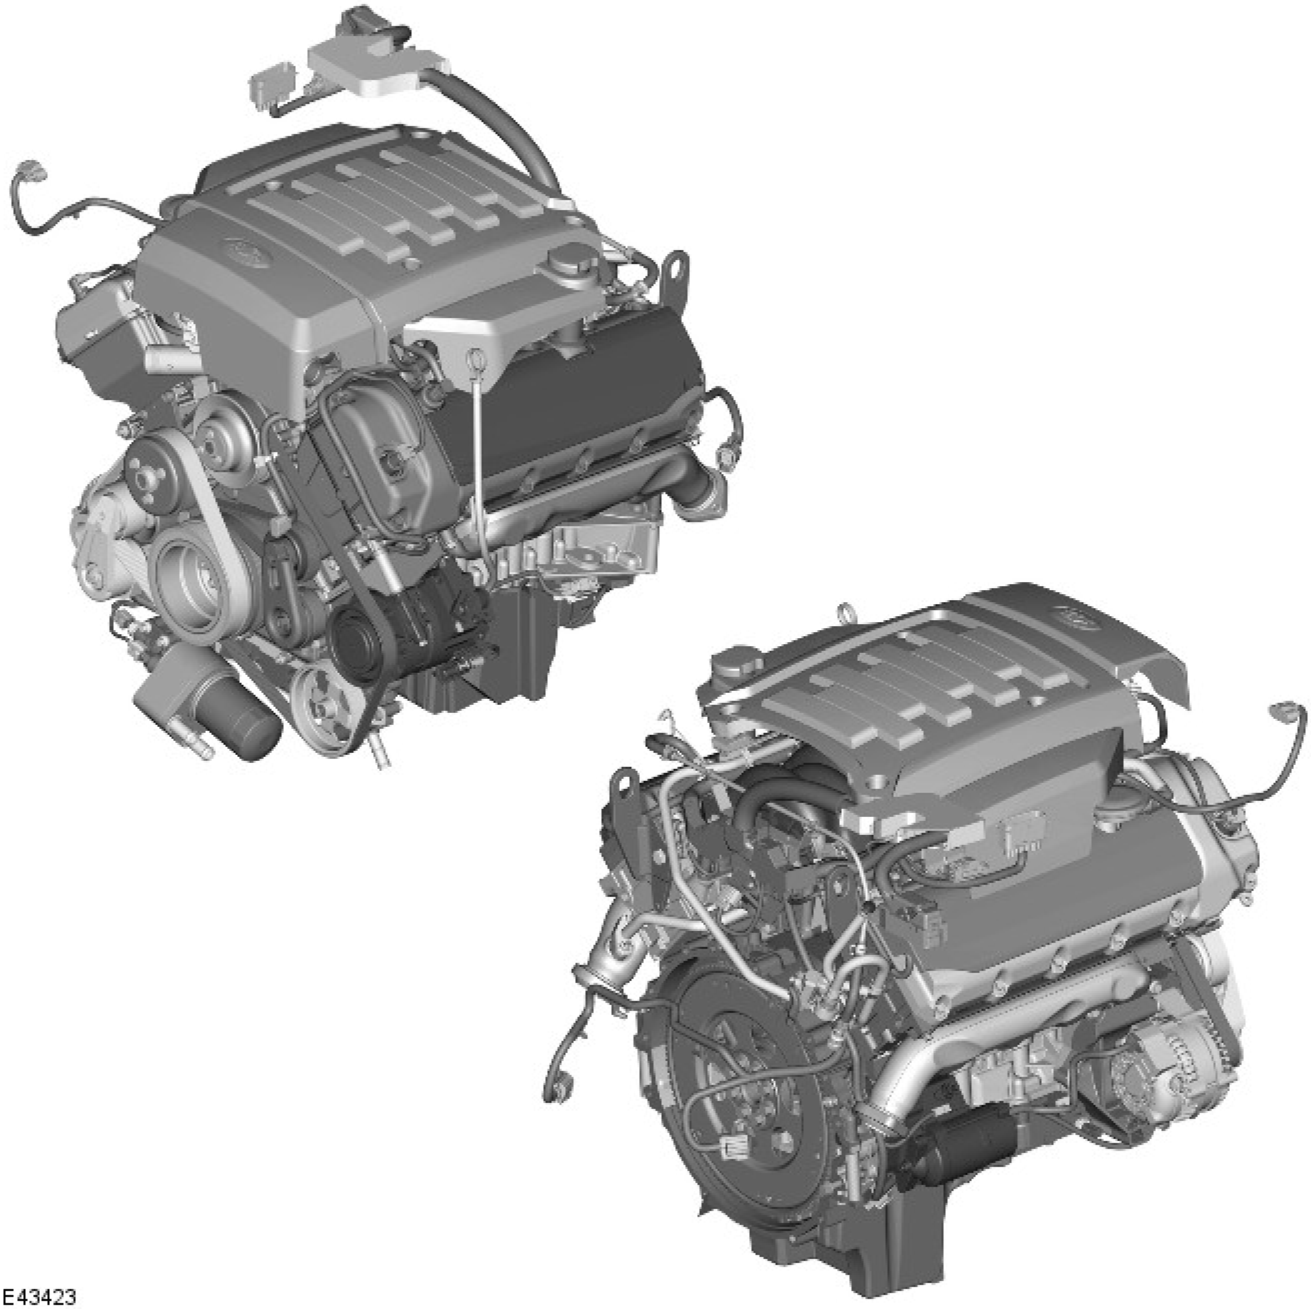
Engine - V8 4.4L Petrol - Engine

Description and Operation

External View



E43423

GENERAL

The V8 petrol engine is a 4.4 litre, 8 cylinder, 90 degrees 'Enclosed' V unit, with 4 valves per cylinder, operated by two overhead camshafts. The engine emissions comply with ECD3 (European Commission Directive) and US Federal Tier2 Bin 8 legislative requirements and employs catalytic converters, electronic engine management control, positive crankcase ventilation and exhaust gas re-circulation to limit the emission of pollutants. The cooling system is a low volume, high velocity system. The Engine Control Module (ECM) controls the fuel injection system, the ignition system and the Exhaust Gas Recirculation (EGR).

The cylinder block is of aluminium alloy construction with cast iron liners and a cast aluminium bedplate bolted to the bottom of the block to improve lower structure rigidity. The cylinder heads are cast aluminium with thermo-plastic camshaft covers. The single-piece oil sump is also cast aluminium. The fabricated stainless steel twin skin exhaust manifolds are unique for each cylinder bank and a moulded plastic acoustic cover is fitted over the upper engine to reduce engine-generated noise.

TECHNICAL FEATURES

The technical features include:

- An eight cylinder 90 degree 'Enclosed V' configuration liquid cooled aluminium cylinder block with cast iron liners
- Pistons are of open-ended skirt design, with two compression rings and a three piece oil control ring
- Two aluminium cylinder heads, each incorporating two camshafts manufactured in chilled cast iron
- Four valves per cylinder
- Graded valve lifters (shimless)
- Variable Valve Timing (VVT) (inlet only)
- Top fed, 8-jet fuel injectors
- Engine front cover manufactured from aluminium which accommodates the crankshaft front oil seal
- Primary and secondary chains drive the camshafts
- An aluminium bed plate
- A cast iron crankshaft
- Fracture-split connecting rods in sintered-forged steel
- A twin multi-vee belt, which drives the front end accessories
- Fabricated stainless steel twin skin exhaust manifolds
- Electronic Exhaust Gas Recirculation (EGR) valve
- An advanced engine management system incorporating electronic throttle control
- Meets with the fault handling requirements, as detailed in the European On-Board Diagnostic (EOBD) III, US Federal OBD and California OBDII legislation.

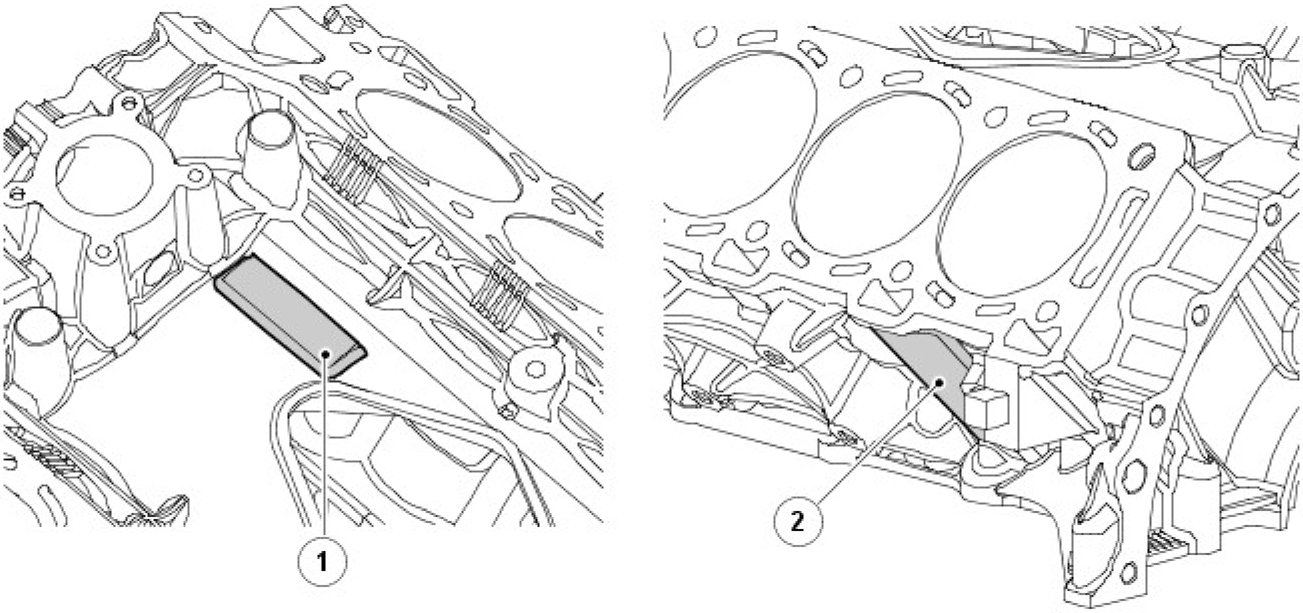
Cylinder Block

The cylinder block is an 'Enclosed V' design, which provides an inherently rigid structure with good vibration levels. A low volume coolant jacket improves warm-up times and piston noise levels; the longitudinal flow design of the jacket, with a single cylinder head coolant transfer port in each bank, improves rigidity and head gasket sealing. The right hand cylinder bank is designated as bank 'A' , and the left hand as bank 'B'.

Engine Data Locations

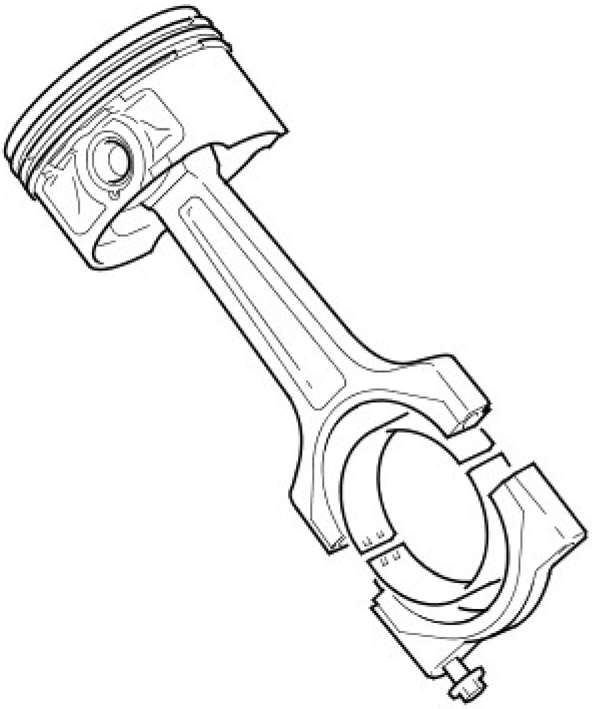


E43426

Item	Part Number	Description
1	-	Engine part number
2	-	Engine data (main bearing diameters, cylinder bore diameters, etc), emissions code and engine number

Engine data is marked at three locations, two on the cylinder block (shown) and one on the engine front cover, which consists a label displaying the engine number. Component diameters are represented by alphabetical and numerical codes; keys to the codes are in the Service Repair Procedures (SRP) Manual.

Connecting Rods and Pistons

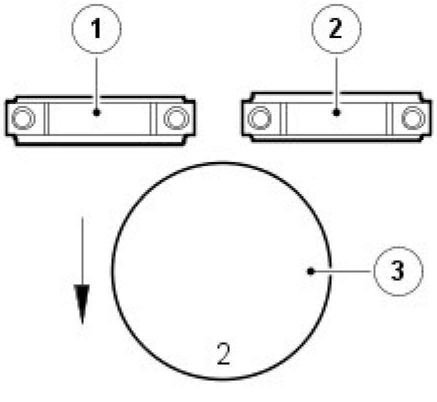


E43427

The connecting rods are manufactured from sinter-forged steel and have fracture-split bearing caps. The bearing caps are produced by fracturing the opposing sides of the connecting rod at the bearing horizontal centre line. As well as being easier to manufacture, when reassembled the fractured surfaces interlock to form a strong seamless joint. The cylinder position is marked on adjoining sides of the joint to identify matching connecting rods and bearing caps. The connecting rod bearings are aluminium/tin split plain bearings.

The pistons are of the open-ended skirt design. Three piston rings, two compression and one oil control, are installed on each piston. Each piston is installed on a gudgeon pin located in a aluminium/tin bushing in the connecting rod.

Connecting Rod and Piston Installation



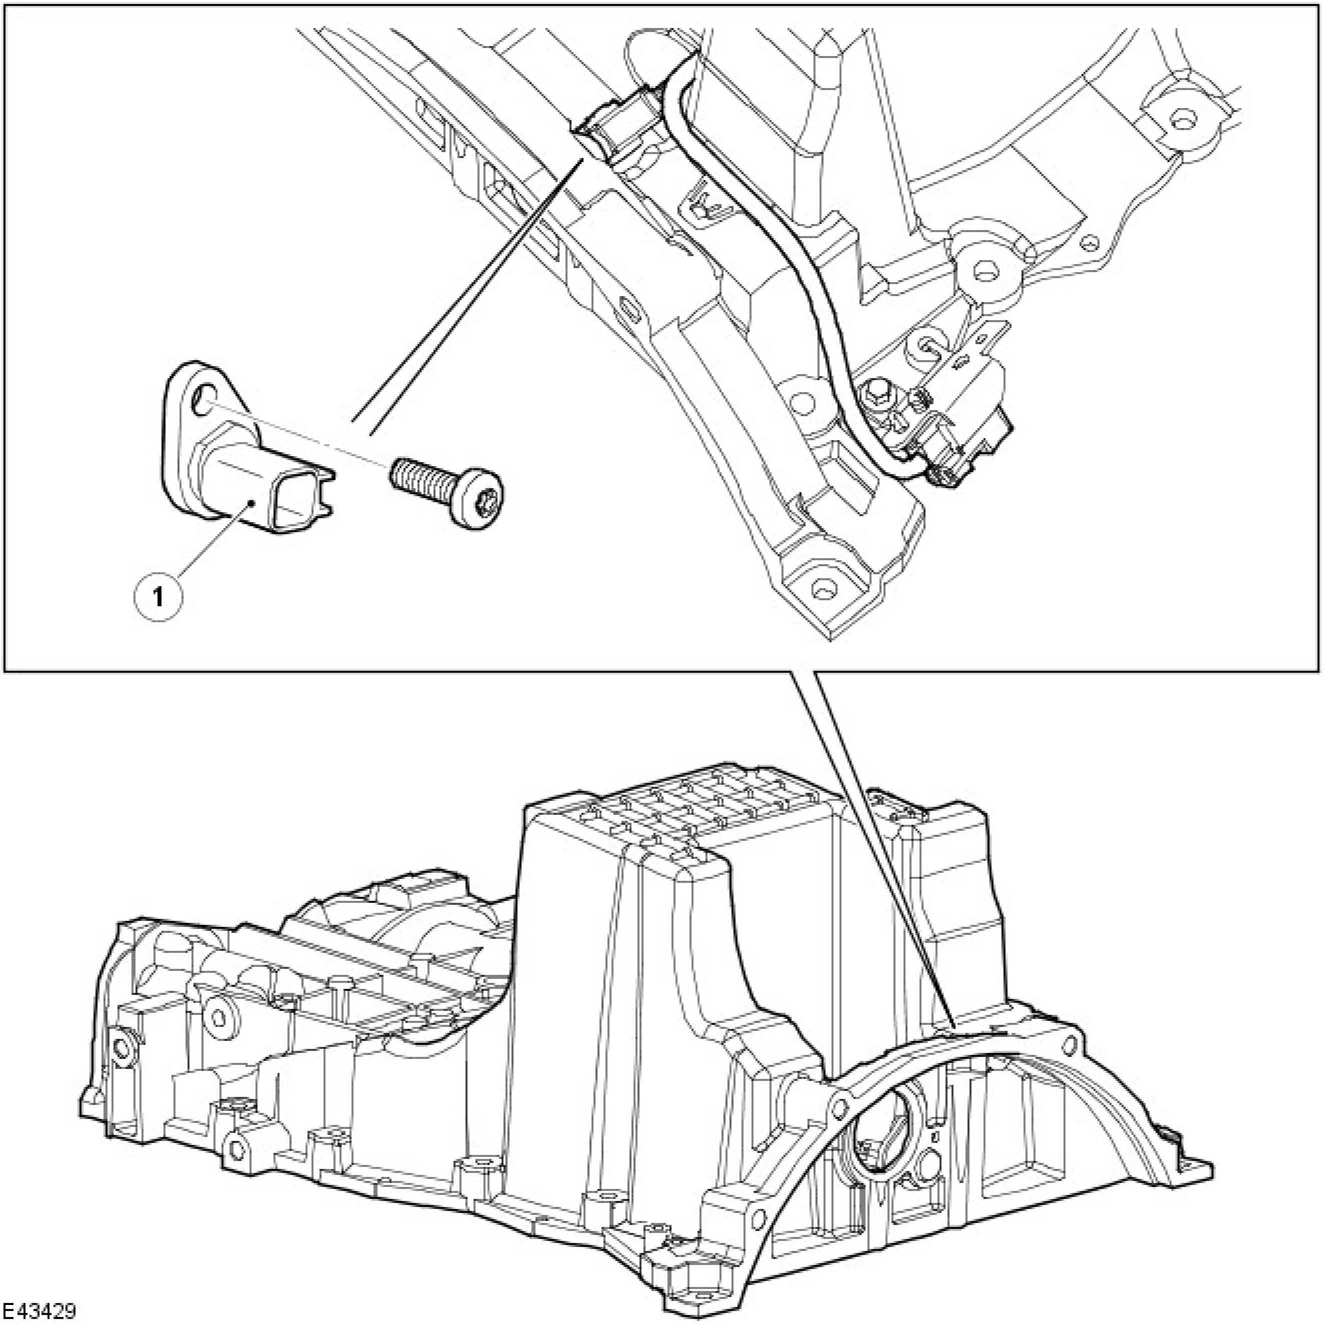
E43428

Item	Part Number	Description
1	-	Bank 'A' (RHS)
2	-	Bank 'B' (LHS)
3	-	Piston

The piston grade number is stamped on the crown of the piston and must coincide with that for each cylinder bore. The piston must be assembled in the correct orientation for the designated cylinder bore:

- Bank 'A' - piston grade number and the thick flange of the connecting rod must face the front of the engine
- Bank 'B' - piston grade number and the thin flange of the connecting rod must face the front of the engine

Crankshaft Position Sensor

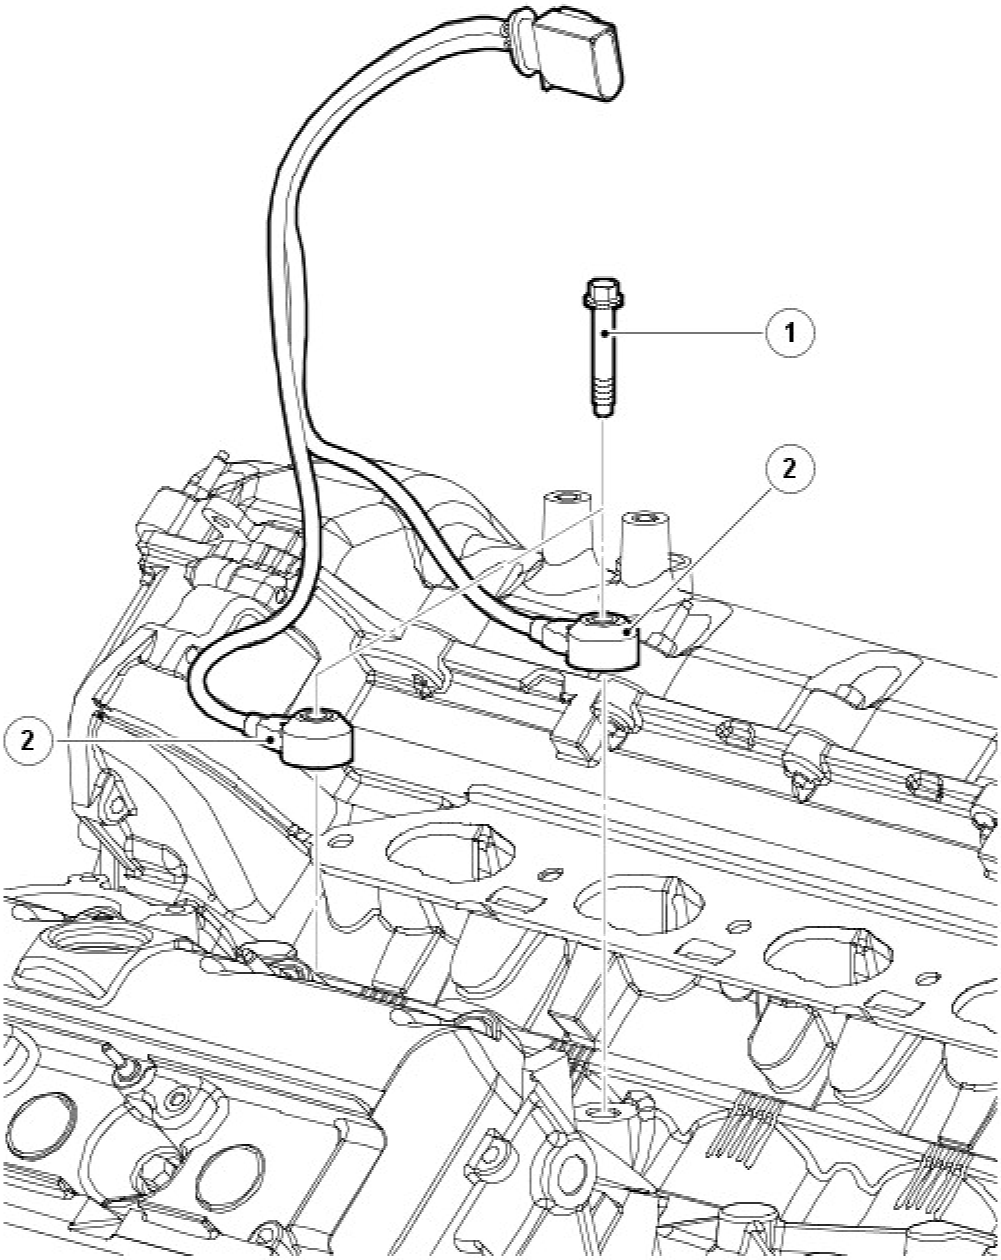


Item	Part Number	Description
1	-	Crankshaft position sensor (CKP)

The CKP sensor is installed at the rear of the sump. It is a variable reluctance sensor that provides an input of engine crankshaft speed and position.

For additional information, refer to: Electronic Engine Controls (303-14B Electronic Engine Controls - V8 4.4L Petrol, Description and Operation).

Knock Sensors



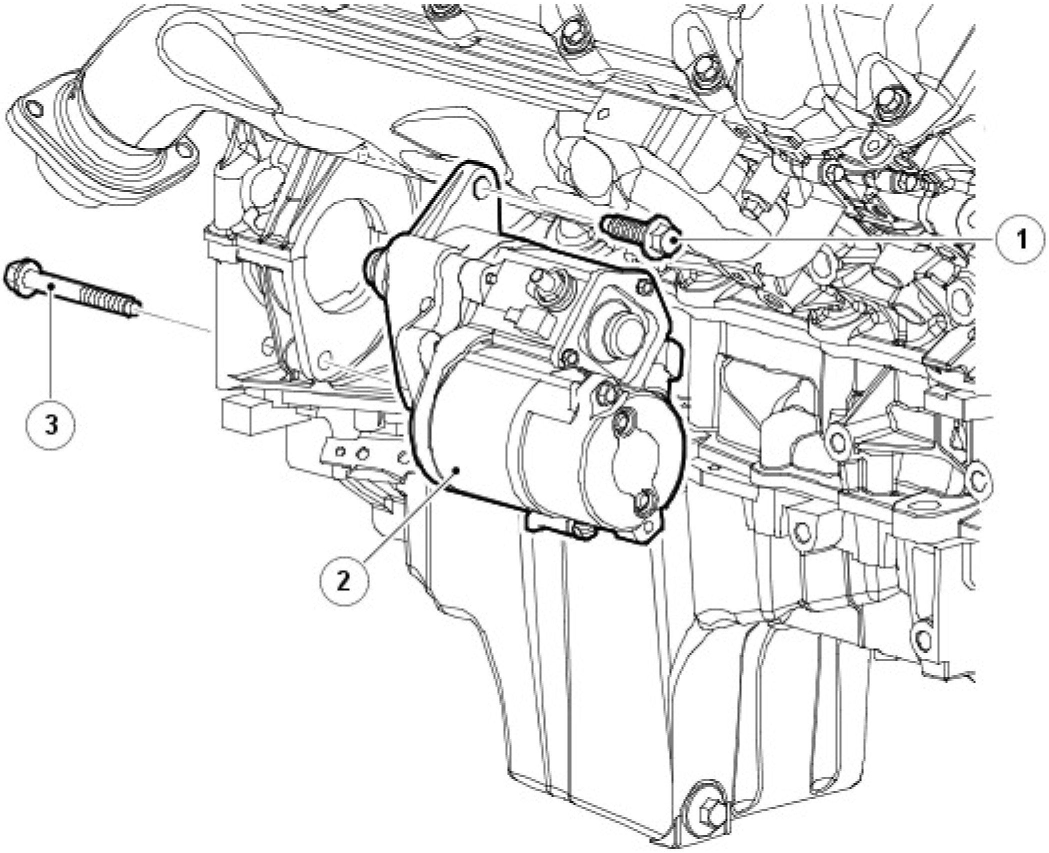
E43430

Item	Part Number	Description
1	-	Bolt
2	-	Knock sensor

The knock sensors are installed in the cylinder block on the inboard side of each cylinder bank. They are piezo-electric sensors that provide inputs to detect and locate detonation during combustion.

For additional information, refer to: Electronic Engine Controls (303-14B Electronic Engine Controls - V8 4.4L Petrol, Description and Operation).

Starter

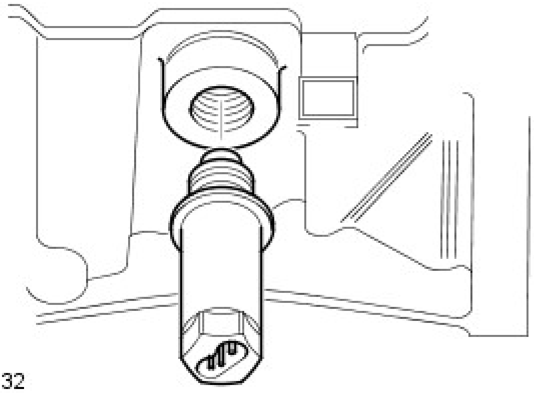


E43431

Item	Part Number	Description
1	-	Bolt
2	-	Starter motor
3	-	Bolt

The engine starter motor is installed at the rear right side of the engine, on the cylinder block to bedplate split line.
For additional information, refer to: Starting System (303-06B Starting System - V8 4.4L Petrol, Description and Operation).

Coolant Drain Plug / Heater

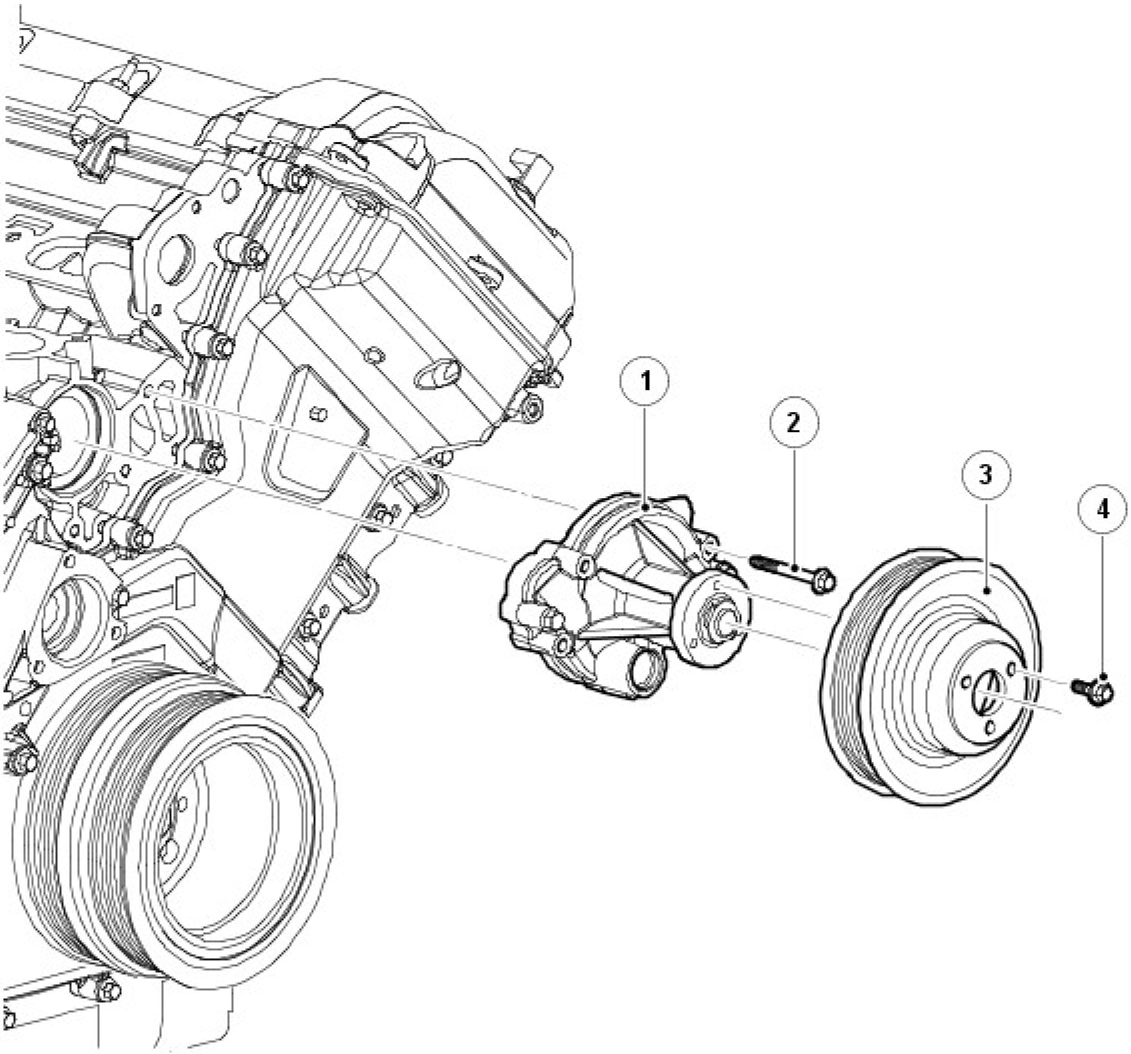


E43432

A coolant drain plug is installed on the rear left side of the cylinder block. On vehicles with the cold climate package, the cylinder block heater replaces the drain plug.

On vehicles destined for Canada, the coolant heater is installed during engine manufacture, but for Scandinavian vehicles the heater is supplied in kit form to be installed at the dealership.

Coolant Pump

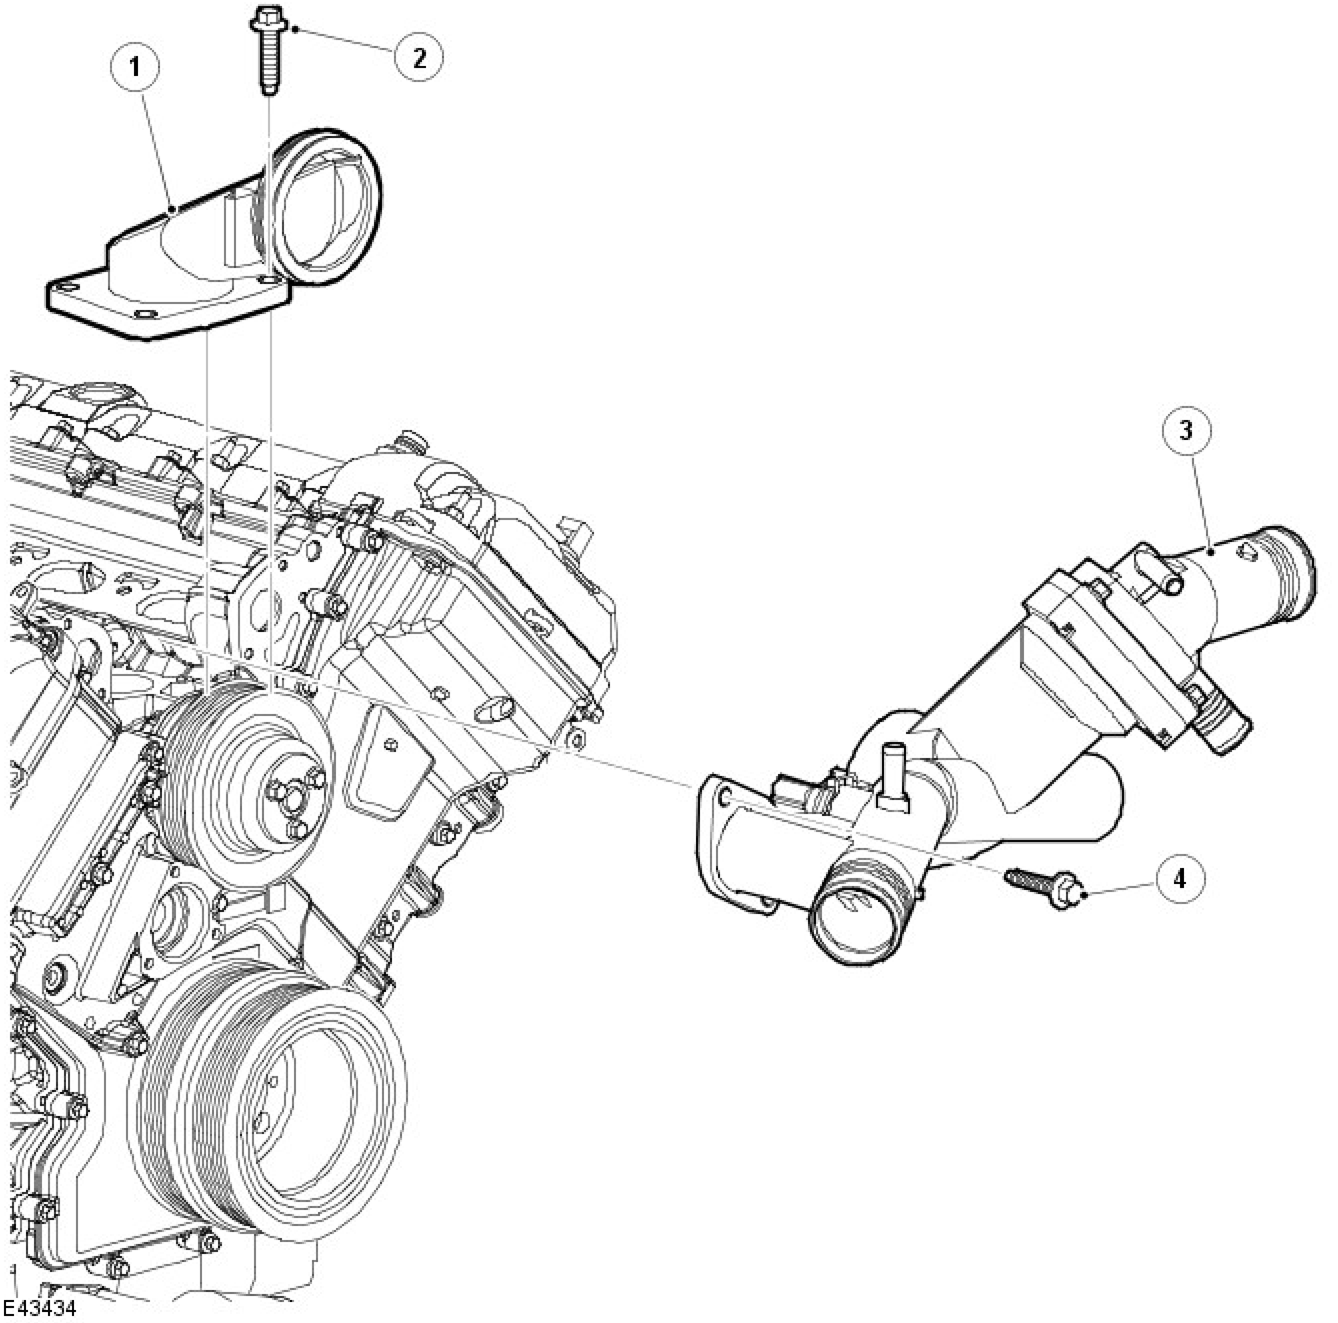


E43433

Item	Part Number	Description
1	-	Coolant pump
2	-	Bolt
3	-	Pulley
4	-	Bolt

The coolant pump is installed between the two cylinder banks, on the front face of the cylinder block.

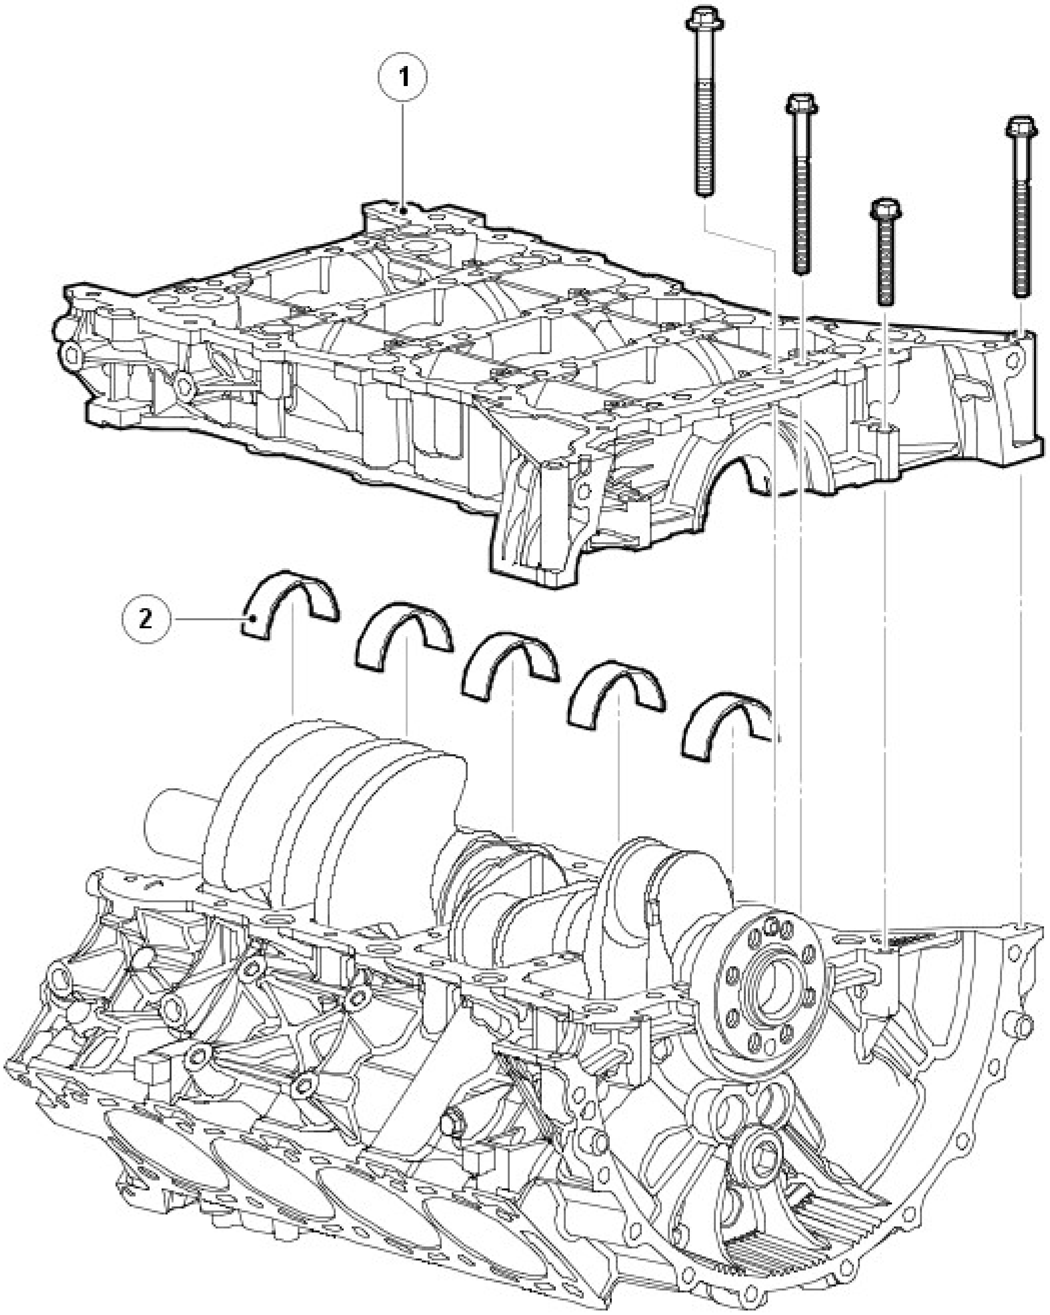
Thermostat Housing



Item	Part Number	Description
1	-	Coolant outlet elbow
2	-	Bolt
3	-	Thermostat housing
4	-	Bolt

The composite thermostat housing is installed between the two cylinder banks, immediately above the coolant pump. The thermostat controls the flow of coolant through the radiator.

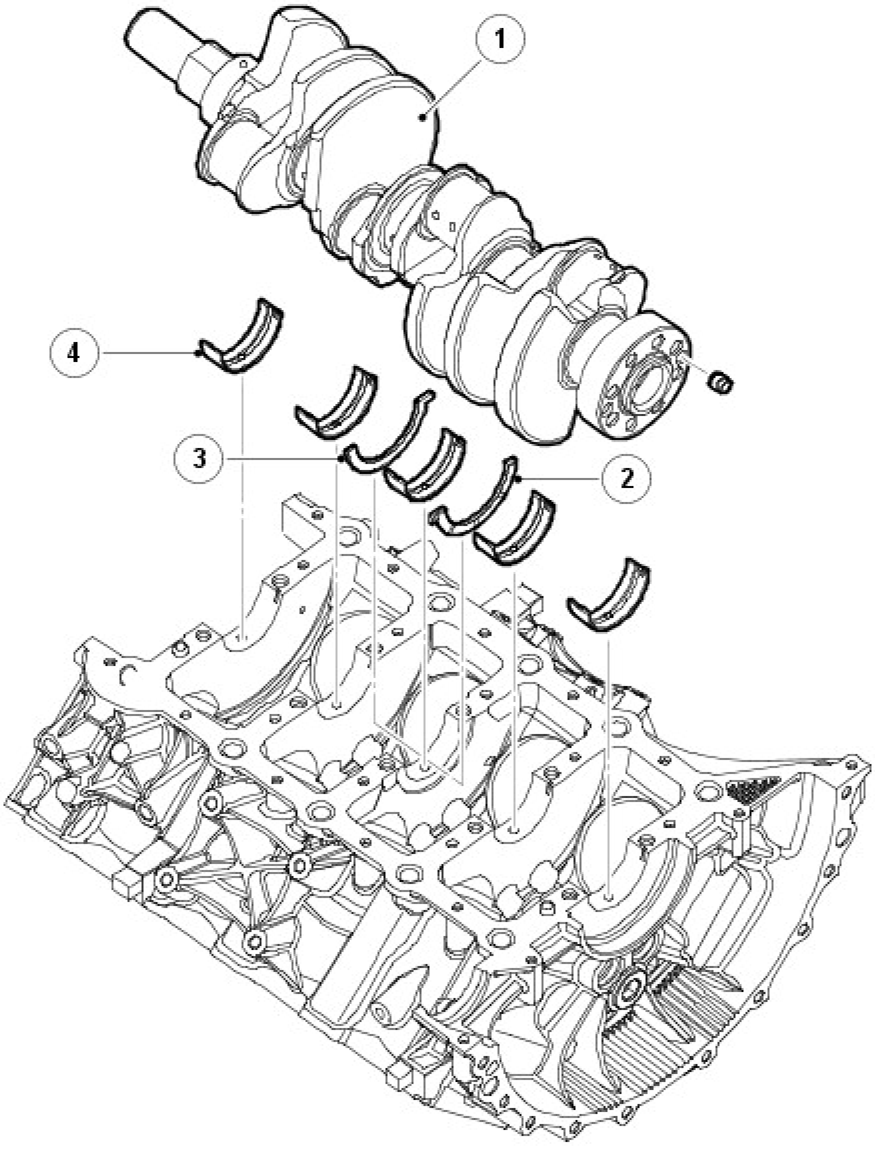
CRANKSHAFT AND SUMP COMPONENTS



E43435

Item	Part Number	Description
1	-	Bedplate
2	-	Main bearings - lower

Crankshaft and Main Bearings



E43436

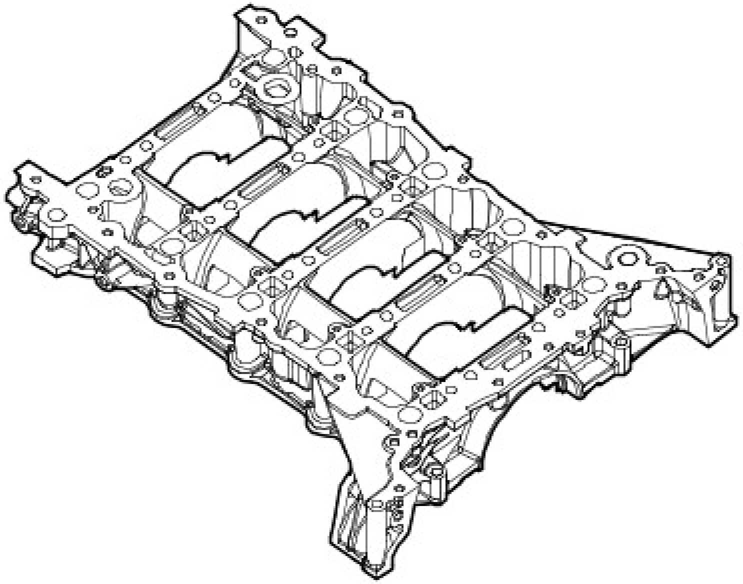
Item	Part Number	Description
1	-	Crankshaft
2	-	Thrust washer
3	-	Thrust washer
4	-	Main bearings - upper

Six counter-balance weights ensure good vibration levels from the four throw, five bearing crankshaft. Manufactured in cast iron, the crankshaft also has undercut and rolled fillets for improved strength.

The crankshaft rear oil seal is a press fit in the bedplate to cylinder block interface.

The main bearings are aluminium/tin split plain bearings. An oil groove in the upper half of each bearing transfers the oil into the crankshaft for lubrication of the connecting rod bearings. An aluminium/tin thrust washer is installed each side of the top half of the centre main bearing.

Bedplate



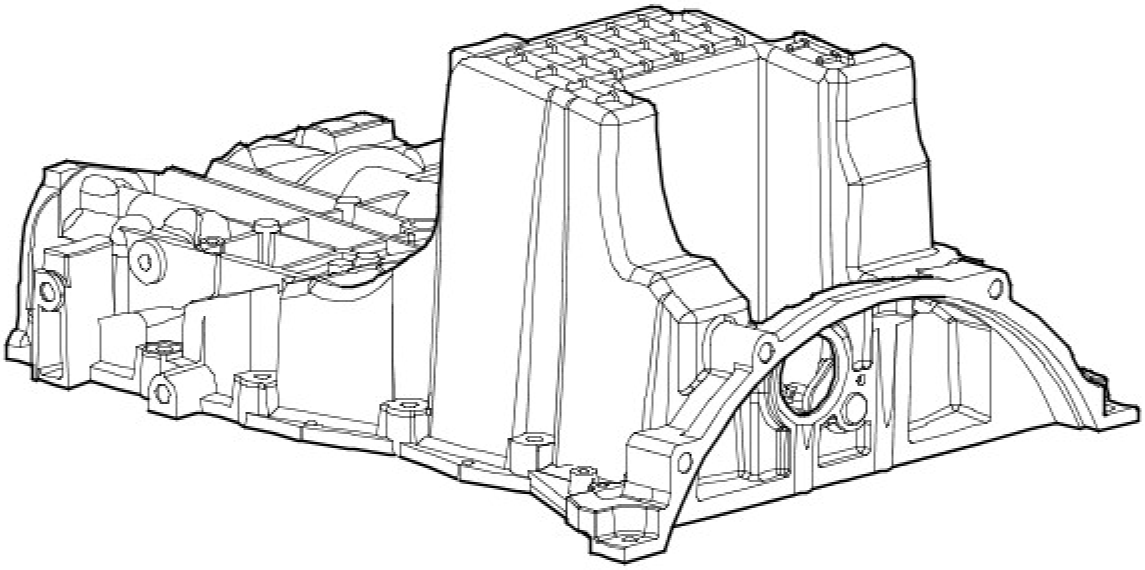
E43437

The bedplate is a structural casting bolted to the bottom of the cylinder block to retain the crankshaft. The use of a bedplate further improves rigidity. Iron inserts, cast into the main bearing supports of the bedplate, minimise main bearing clearance changes due to heat expansion.

Two hollow dowels align the bedplate with the cylinder block.

Beads of sealant seal the joint between the bedplate and the cylinder block.

Sump

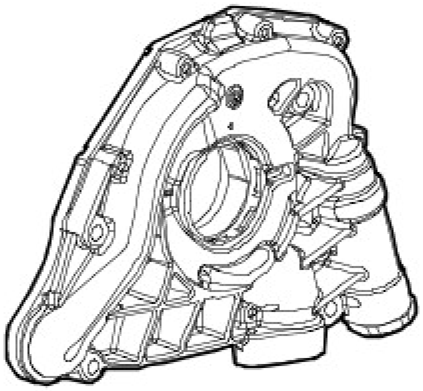


E43438

The aluminium alloy structural sump is bolted to the bedplate. A windage tray attached to the underside of the bedplate isolates the oil pan from the disturbed air produced by the rotation of the crankshaft, to prevent oil aeration and improve oil drainage. A rubber plug at the rear of the structural sump seals the port that provides access to the torque converter securing bolts. The engine oil drain plug is located at the front right corner of the oil pan.

A bead of sealant seals the joint between the structural sump and the bedplate.

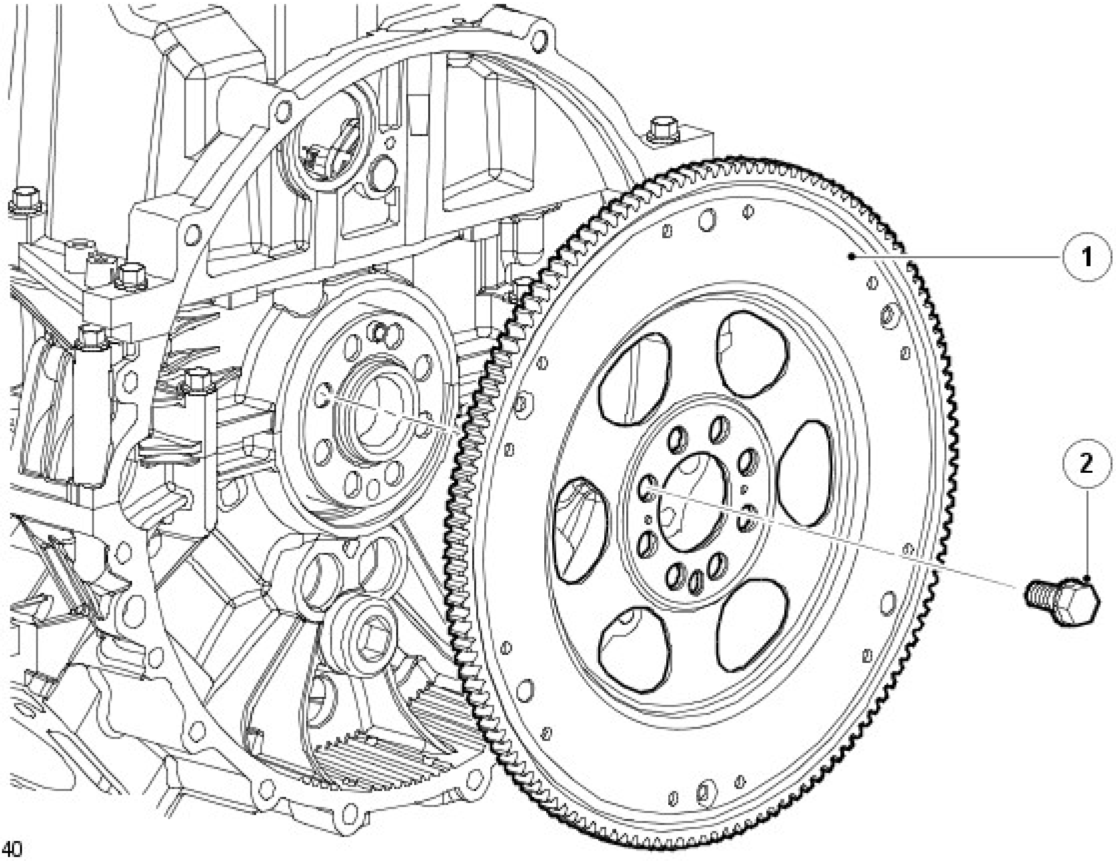
Oil Pump



E43439

The oil pump is installed on the crankshaft at the front of the engine. The pump outlet port aligns with oil passages in the bedplate.

Starter Drive Plate



E43440

Item	Part Number	Description
1	-	Starter drive plate
2	-	Bolt

The starter drive plate is attached to the rear of the crankshaft. A timing disc, for the engine speed sensor, is spot welded to the front face of the drive plate.

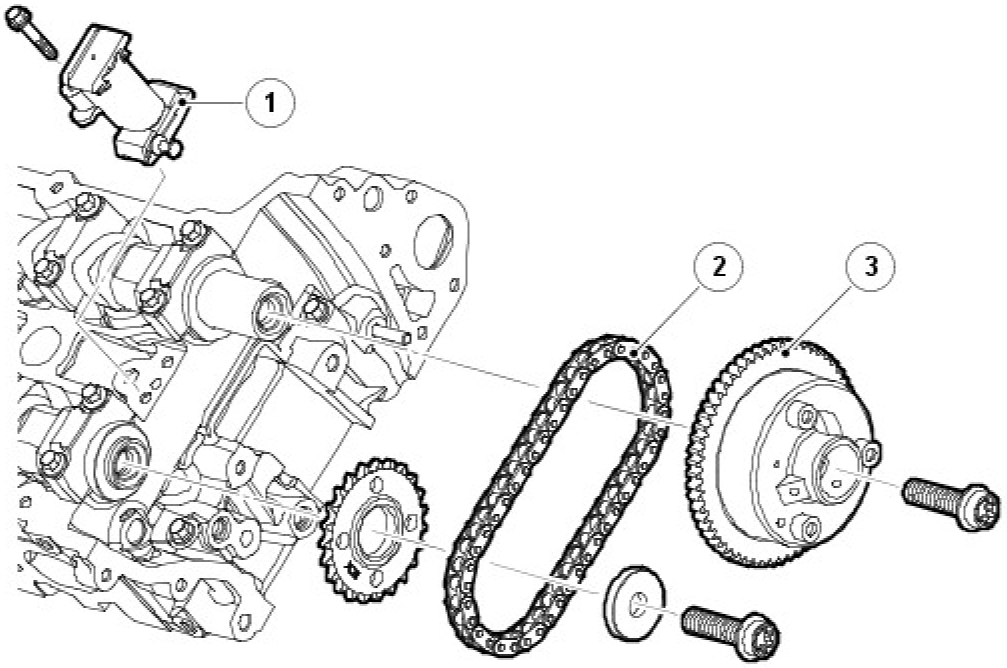
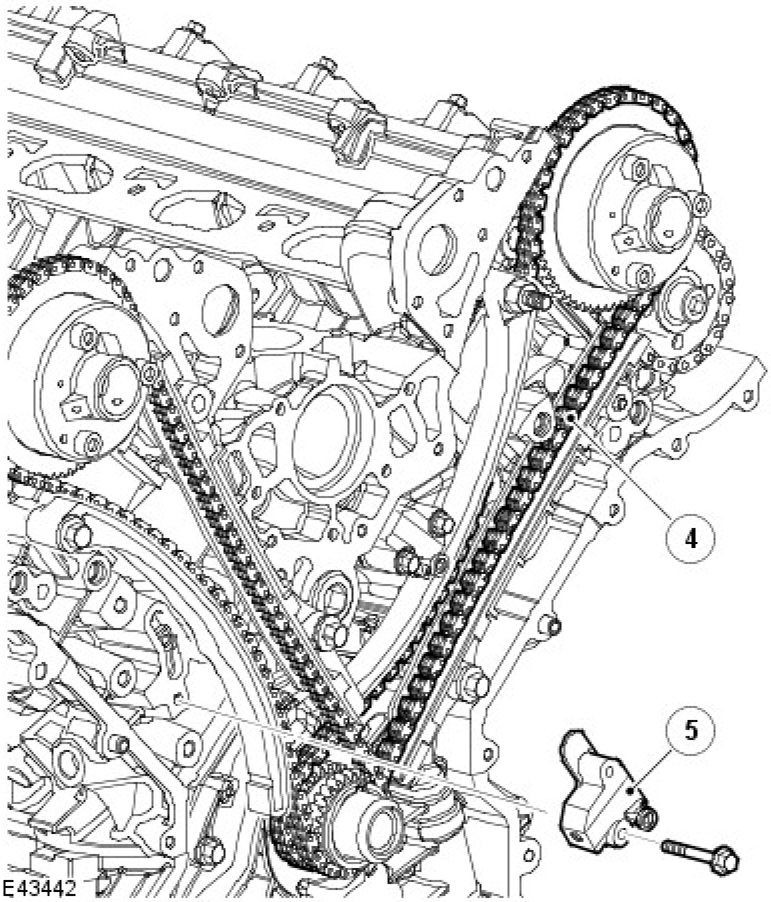
CAMSHAFT TIMING COMPONENTS





Item	Part Number	Description
1	-	Secondary chain tensioner
2	-	Secondary chain
3	-	Variable valve timing unit
4	-	Primary chain
5	-	Primary chain tensioner

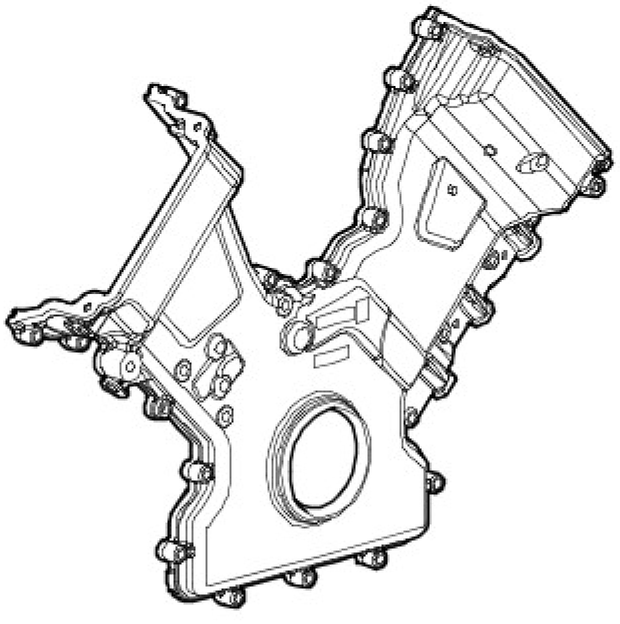
Timing Gear

Multiple link primary and single row secondary chains drive the camshafts of each cylinder bank. The primary chains transmit the drive from two sprockets on the crankshaft to variable valve timing units on the intake camshafts. The secondary chains transmit the drive from the variable valve-timing units to sprockets on the exhaust camshafts.

A key locates the two drive sprockets on the crankshaft. The crankshaft's torsional vibration damper retains the sprockets in position. The variable valve timing units and the exhaust camshaft sprockets are non-interference, non-keyed fits on their respective camshafts; the drive being transmitted by the face to face friction load produced by the valve timing unit/sprocket securing bolt.

Each chain has a hydraulic tensioner operated by engine oil. The primary chains are lubricated via oil squirt tubes located at the front of the engine block, near the crankshaft drive sprockets. A jet of oil from the end of each secondary chain tensioner lubricates the secondary chains. The primary chain tensioners act on pivoting flexible tensioner blades. The secondary chain tensioners act directly on the chains. Guide rails are installed on the drive side of the primary chains.

Timing Cover



E43443

The aluminium alloy timing cover accommodates the crankshaft front oil seal (a PTFE lip seal). Silicon rubber in-groove gaskets seal the joint between the timing cover and the front face of the engine.

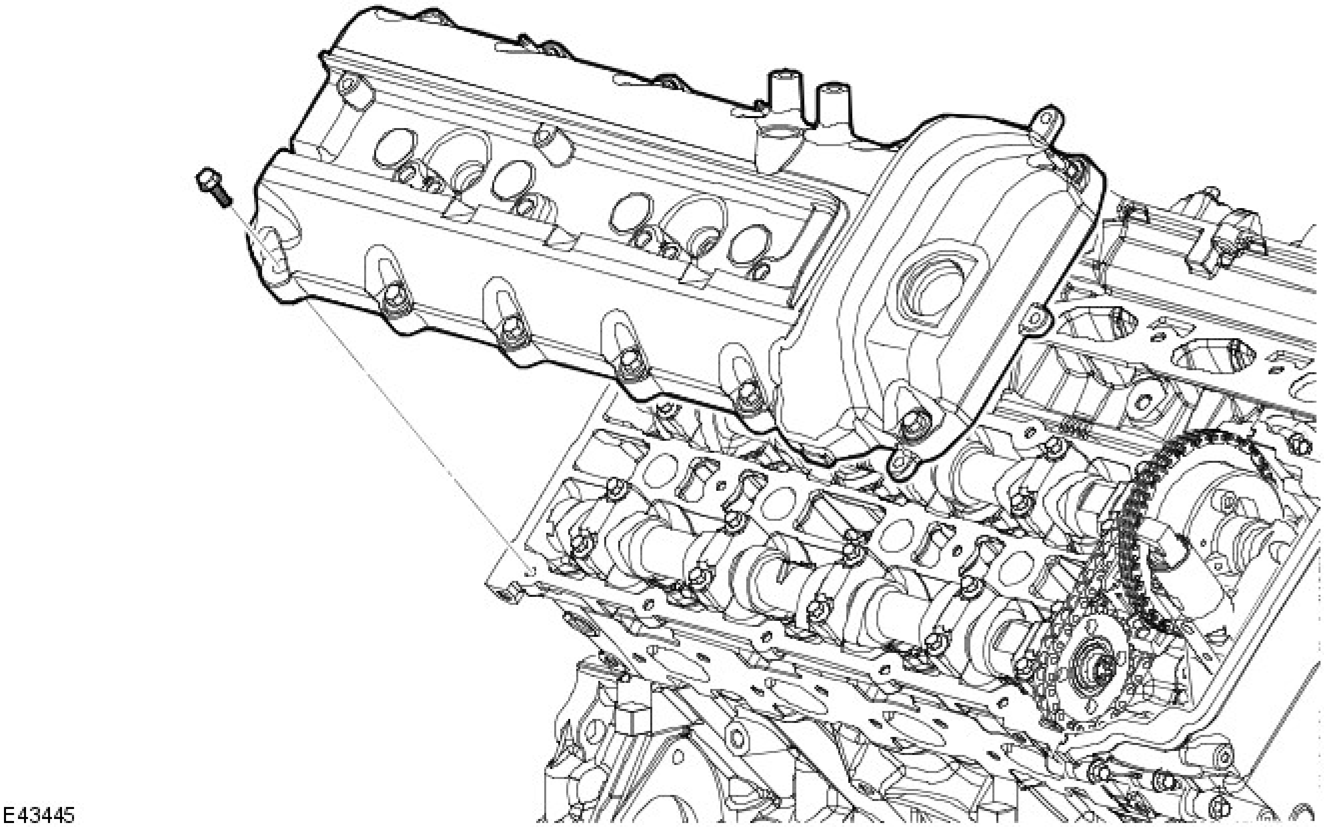
Cylinder Heads

The cylinder heads are unique to each cylinder bank. Deep-seated bolts, to reduce distortion, secure the cylinder heads to the cylinder block. Two hollow dowels align each cylinder head with the cylinder block.

The 14 mm spark plugs, one per cylinder, locate in recesses down the centre line of each cylinder head.

The engine-lifting eyes are bolted to the cylinder heads; two on the rear (one per head) and one at the front.

Camshaft Covers



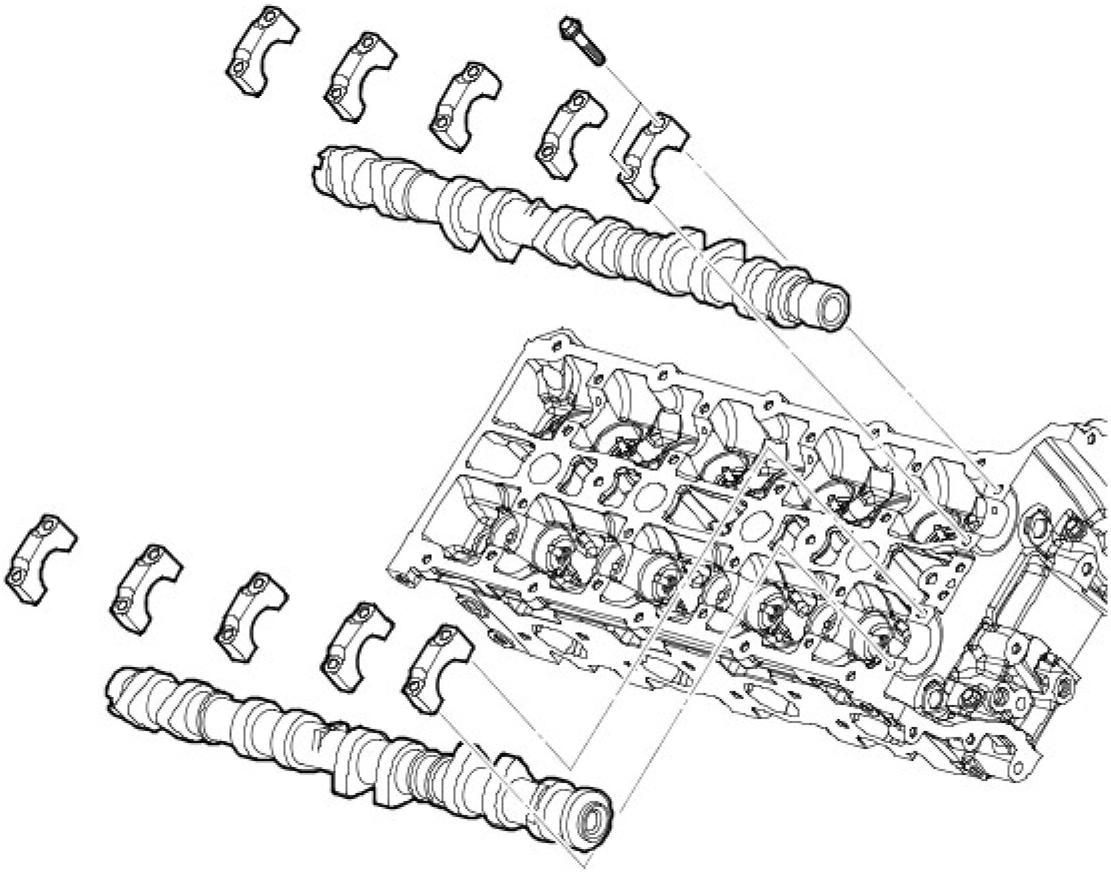
The camshaft covers are manufactured from thermo-plastic. The bank 'A' camshaft cover incorporates an outlet for the part load engine breather. The bank 'B' camshaft cover incorporates an outlet for the full load engine breather and the engine oil filler cap. Identical oil separators are incorporated below the breather outlet in each cover.
For additional information, refer to: Electronic Engine Controls (303-14B Electronic Engine Controls - V8 4.4L Petrol, Description and Operation).

Silicon rubber in-groove gaskets seal the joints between the camshaft covers and the cylinder heads. Together with spacers and seals on the camshaft cover fasteners, they also isolate the covers from direct contact with the cylinder heads, to reduce noise.

Cylinder Head Gasket

The multi-layered steel cylinder head gasket has cylinder specific water flow cross-sections for uniform coolant flow.

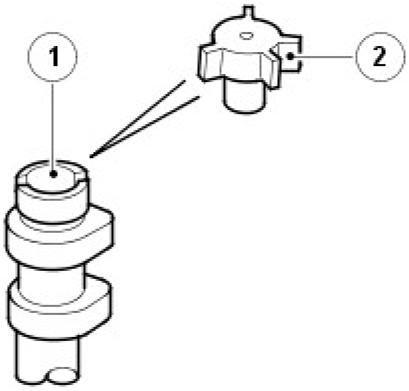
Camshafts



E43446

The camshafts are manufactured in chilled cast iron. Five aluminium alloy caps retain each camshaft. Location numbers, 0 to 4 for the intake camshaft and 5 to 9 for the exhaust camshaft, are marked on the outer faces of the caps.

Sensor Ring

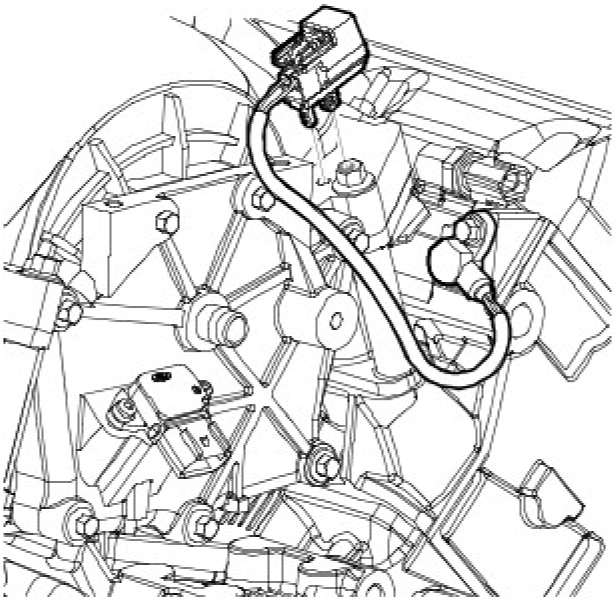


E43447

Item	Part Number	Description
1	-	Inlet camshaft
2	-	Sensor ring

Timing rings for each camshaft position sensor are located at the rear of both intake camshafts. A flat, machined near the front of each camshaft, enables the camshafts to be locked during the valve timing procedure.

Camshaft Position Sensor



E43448

The camshaft position sensors are installed in each cylinder head at the rear of the intake camshaft. It is a variable reluctance sensor that provides an input to the ECM regarding the position of the camshaft.
For additional information, refer to: Electronic Engine Controls (303-14B Electronic Engine Controls - V8 4.4L Petrol, Description and Operation).

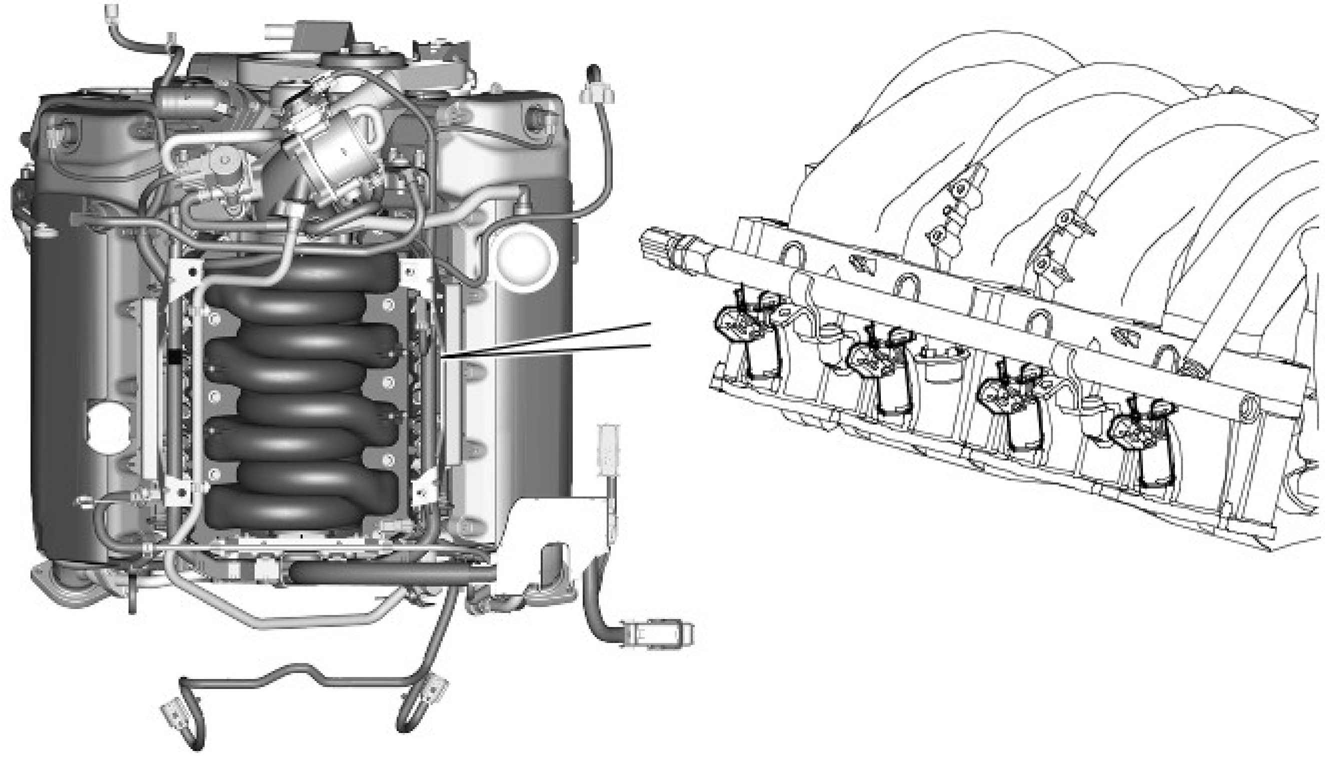
Inlet and Exhaust Valves

Each cylinder head incorporates dual overhead camshafts operating four valves per cylinder via solid shimless aluminium alloy valve lifters.

The lightweight valve gear provides good economy and noise levels. Valve head diameters are 31mm (1.220 in) for the exhaust and 35mm (1.378 in) for the intake. All valves have 5mm (0.197 in) diameter stems supported in sintered metal seats and guide inserts. Collets, valve collars and spring seats locate single valve springs on both intake and exhaust valves. Valve stem seals are integrated into the spring seats.

⚠CAUTION: Due to slight variations in length, the valves are **not** interchangeable between marques (Land Rover, Jaguar and Aston Martin).

Fuel Injectors



Eight, top fed, eight hole, fuel injectors are installed in the fuel rails. The injectors are electromagnetic solenoid valves controlled by the ECM. Two O-rings seal each injector to manifold interface. The fuel jets from the injectors are directed onto the back of the intake valves.
For additional information, refer to: Electronic Engine Controls (303-14B Electronic Engine Controls - V8 4.4L Petrol, Description and Operation).

VARIABLE VALVE TIMING (VVT)

The continuously VVT unit turns the intake camshaft in relation to the primary chain to advance and retard the timing.

The system improves low and high-speed engine performance, engine idle quality and exhaust emission.

The VVT system changes the phasing of the intake valves, relative to the fixed timing of the exhaust valves, to alter:

- the mass of air flow into the engine's cylinders,
- and the engine's torque response and emissions.

The VVT unit uses a vane device to control the camshaft angle (refer to VVT operation). The system operates over a range of 48° and is advanced or retarded to the optimum angle within this range.

The ECM controls the VVT, using engine speed and load, engine oil temperature and throttle position signals to calculate the appropriate camshaft position.
For additional information, refer to: Electronic Engine Controls (303-14B Electronic Engine Controls - V8 4.4L Petrol, Description and Operation).

The continuous VVT system provides the following advantages:

- Reduces engine emissions and fuel consumption by further optimising the camshaft timing, this improves the engine's internal exhaust gas re-circulation (EGR) effect over a wider operating range
- Improves full-load torque characteristics as the camshaft timing is optimised at all engine speeds for superior volumetric efficiency
- Improves fuel economy by optimising torque over the engine's speed range.

Variable Valve Timing Operation

The VVT unit is a hydraulic actuator mounted on the end of the intake camshaft, which advances or retards the intake camshaft timing and thereby alters the camshaft to crankshaft phasing. The oil control solenoid, controlled by the ECM, routes oil pressure to either the advance or retard chambers located either side of the three vanes interspersed within the machined housing of the unit.

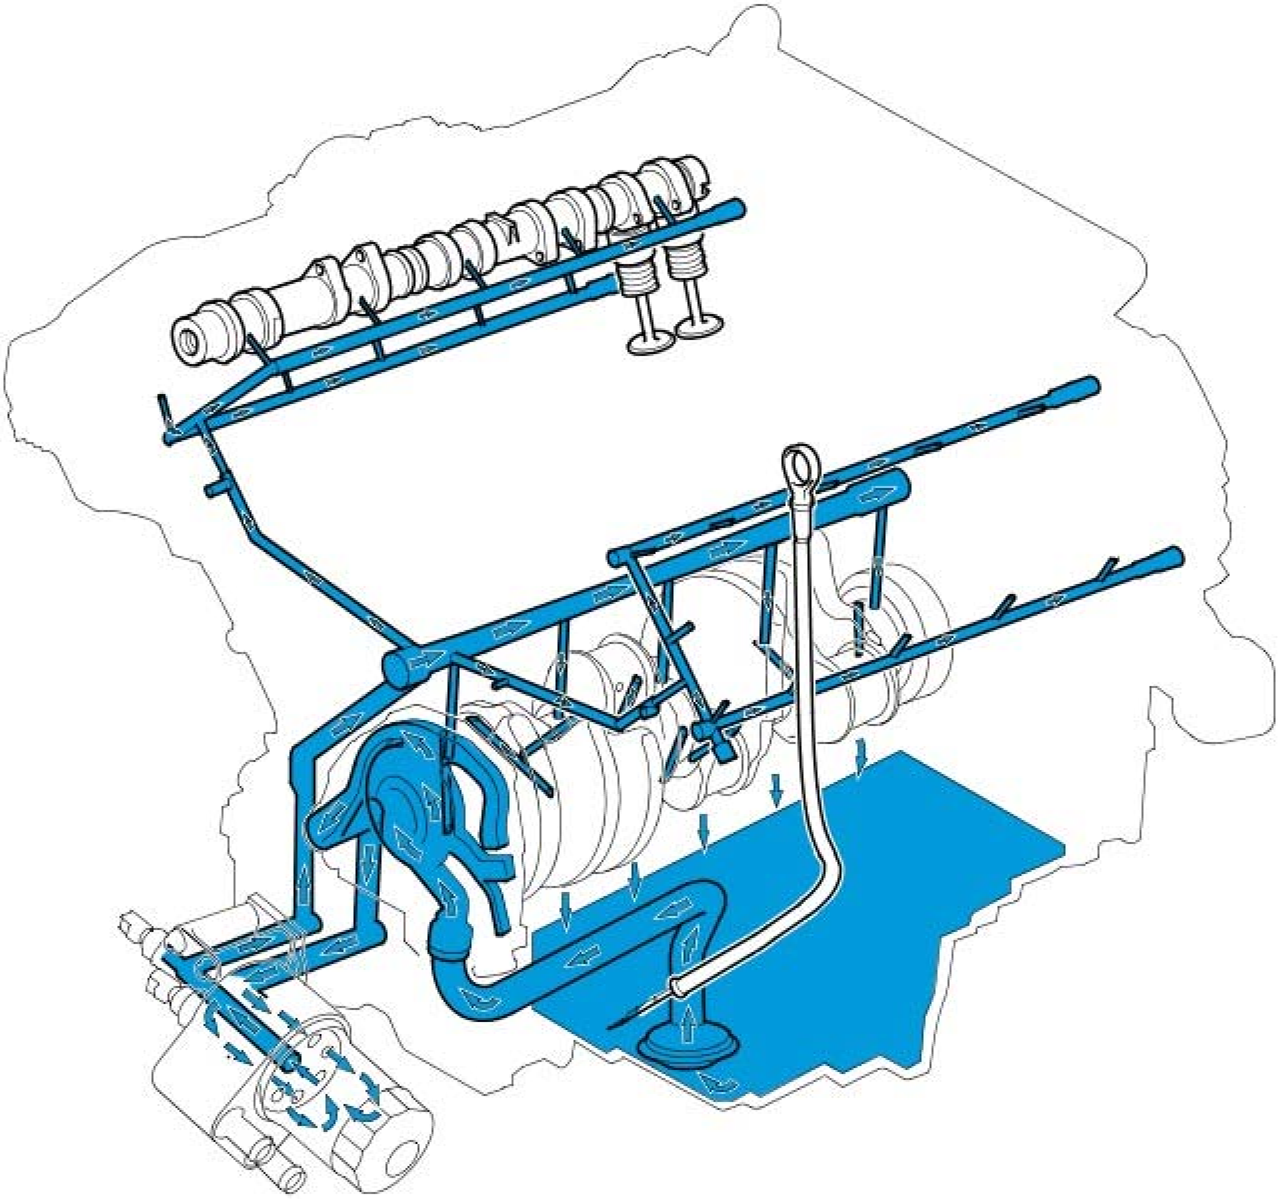
The VVT unit is driven by the primary chain and rotates relative to the exhaust camshaft sprocket. When the ECM requests the camshaft timing to advance, the oil control solenoid is energized moving the shuttle valve to the relevant position to allow engine oil pressure, via a filter, into the VVT unit's advance chambers. When the camshaft timing is requested to retard, the shuttle valve moves position to allow oil pressure to exit the advance chambers, while simultaneously routing the oil pressure into the retard chambers.

When directed by the ECM, the VVT unit will be set to the optimum position between full advance and retard for a particular engine speed and load. This is achieved when the ECM sends the energising signal to the oil control solenoid until the target position is met. At this point, the energizing signal is reduced to hold the solenoid position, and as a result the position of the shuttle valve. This function is under closed-loop control, where the ECM will alter the energizing signal, when required, to maintain the desired position.

Engine oil properties and temperature can affect the ability of the VVT mechanism to follow demand changes to the cam phase angle. At very low oil-temperatures, movement of the VVT mechanism is sluggish due to increased viscosity, and at high oil-temperatures the reduced viscosity may impair operation if the oil pressure is too low. To maintain satisfactory VVT performance, an increased capacity oil pump is installed, plus an engine oil temperature sensor to enable monitoring by the ECM. The VVT system is normally under closed-loop control except in extreme temperature conditions, such as cold starts below 0°C. At extremely high oil-temperatures, the ECM may limit the amount of VVT advance to prevent the engine from stalling when returning to idle speed.

The VVT does not operate when engine oil-pressure is below 1.25 bar, as there is insufficient pressure to release the VVT unit's internal stopper pin. This usually occurs when the engine is shutting-down and the VVT has returned to the retarded position. The stopper pin locks the camshaft to the VVT unit to ensure camshaft stability during the next engine start-up.

LUBRICATION SYSTEM



E43454

General

Oil is drawn from the reservoir in the oil pan and pressurised by the oil pump. The output from the oil pump is then filtered, cooled and distributed through internal oil passages.

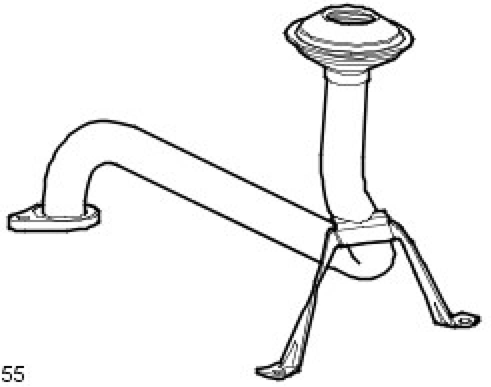
All moving parts are lubricated by pressure or splash oil. Pressurised oil is also provided for operation of the variable valve timing units and the timing gear chain tensioners.

The oil returns to the oil pan under gravity. Large drain holes through the cylinder heads and cylinder block ensure the quick return of the oil, reducing the volume of oil required and enabling an accurate check of the contents soon after the engine stops.

System replenishment is through the oil filler cap on the bank 'B' camshaft cover.

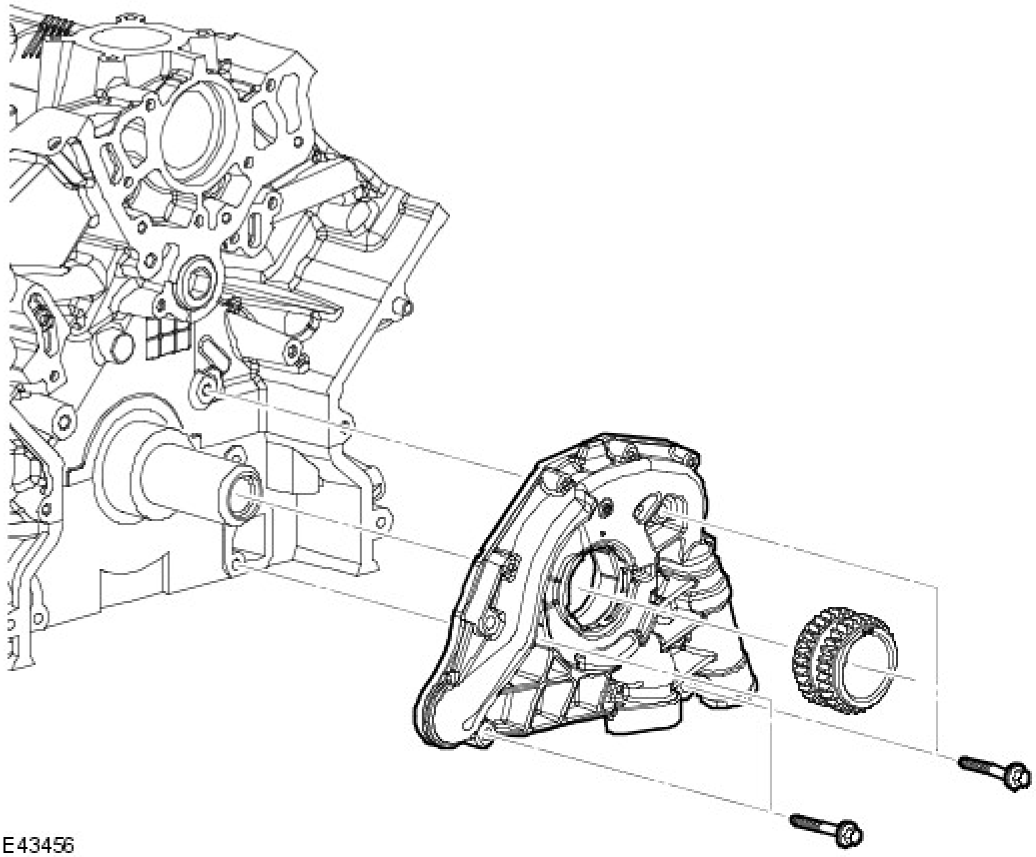
With the exception of the pump, all oil system components are installed on the structural sump.

Oil Pick-up



The fabricated steel oil pick-up is immersed in the oil reservoir to provide a supply to the oil pump during all normal vehicle attitudes. A mesh screen in the inlet prevents debris from entering the oil system.

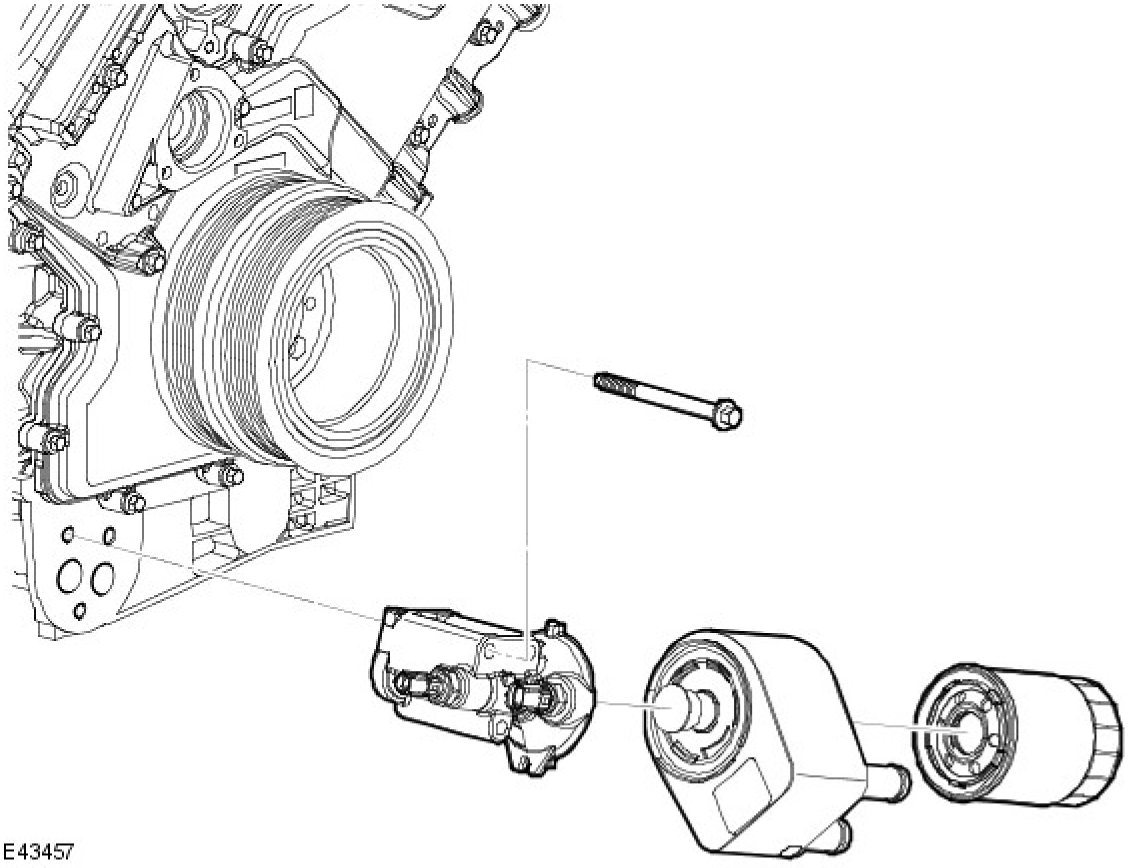
Oil Pump



The oil pump is installed on the crankshaft at the front of the engine. The pump outlet port aligns with oil passages in the bedplate.

The pumping element is an eccentric rotor, which is directly driven by flats on the crankshaft. An integral pressure relief valve regulates pump outlet pressure at 4.5 bar (65.25 psi).

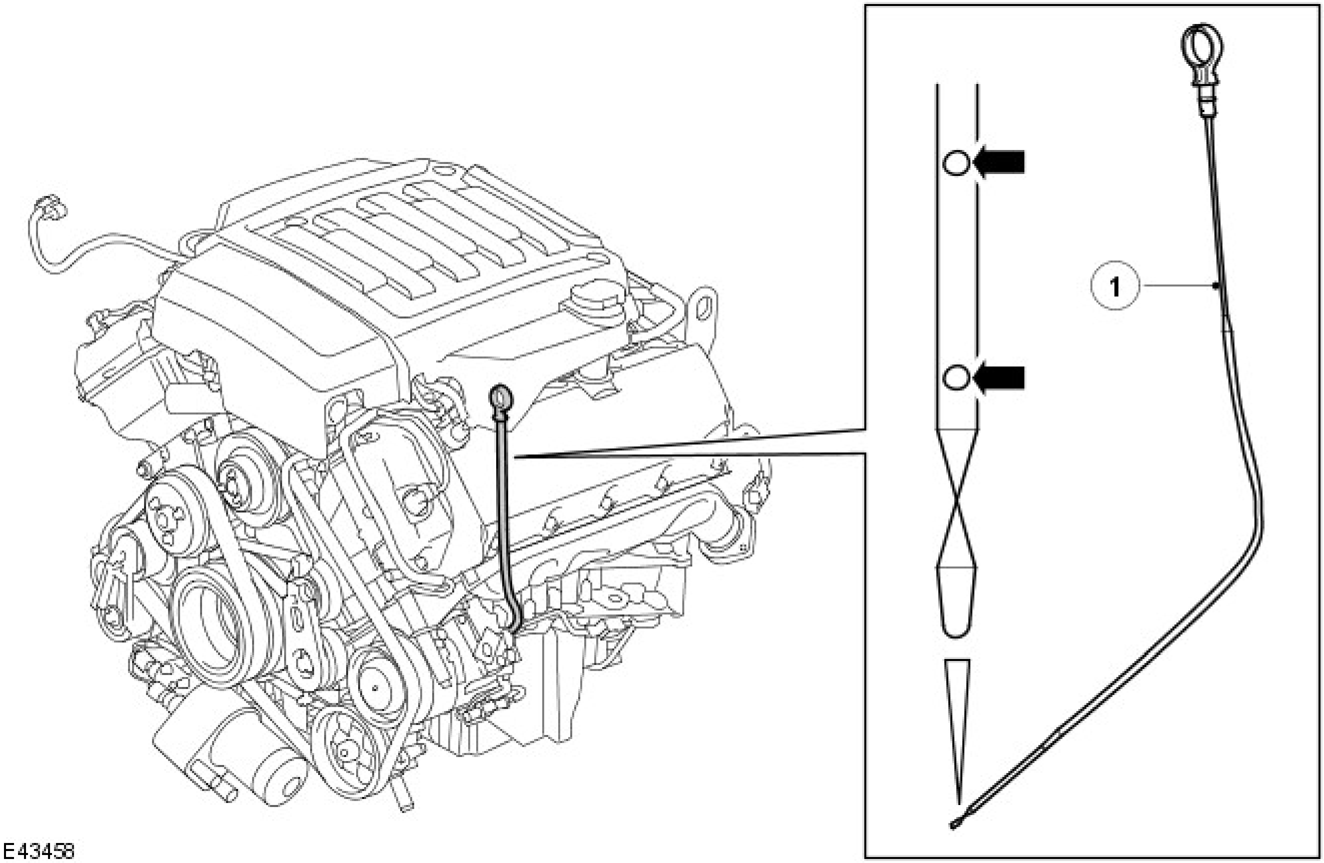
Oil Filter and Oil Pressure Switch



The oil filter is a replaceable cartridge installed on an adapter. An internal bypass facility permits full flow bypass if the filter is blocked.

The oil pressure switch connects a ground input to the instrument cluster when oil pressure is present. The switch operates at a pressure of 0.15 to 0.41 bar (2.2 to 5.9 psi).

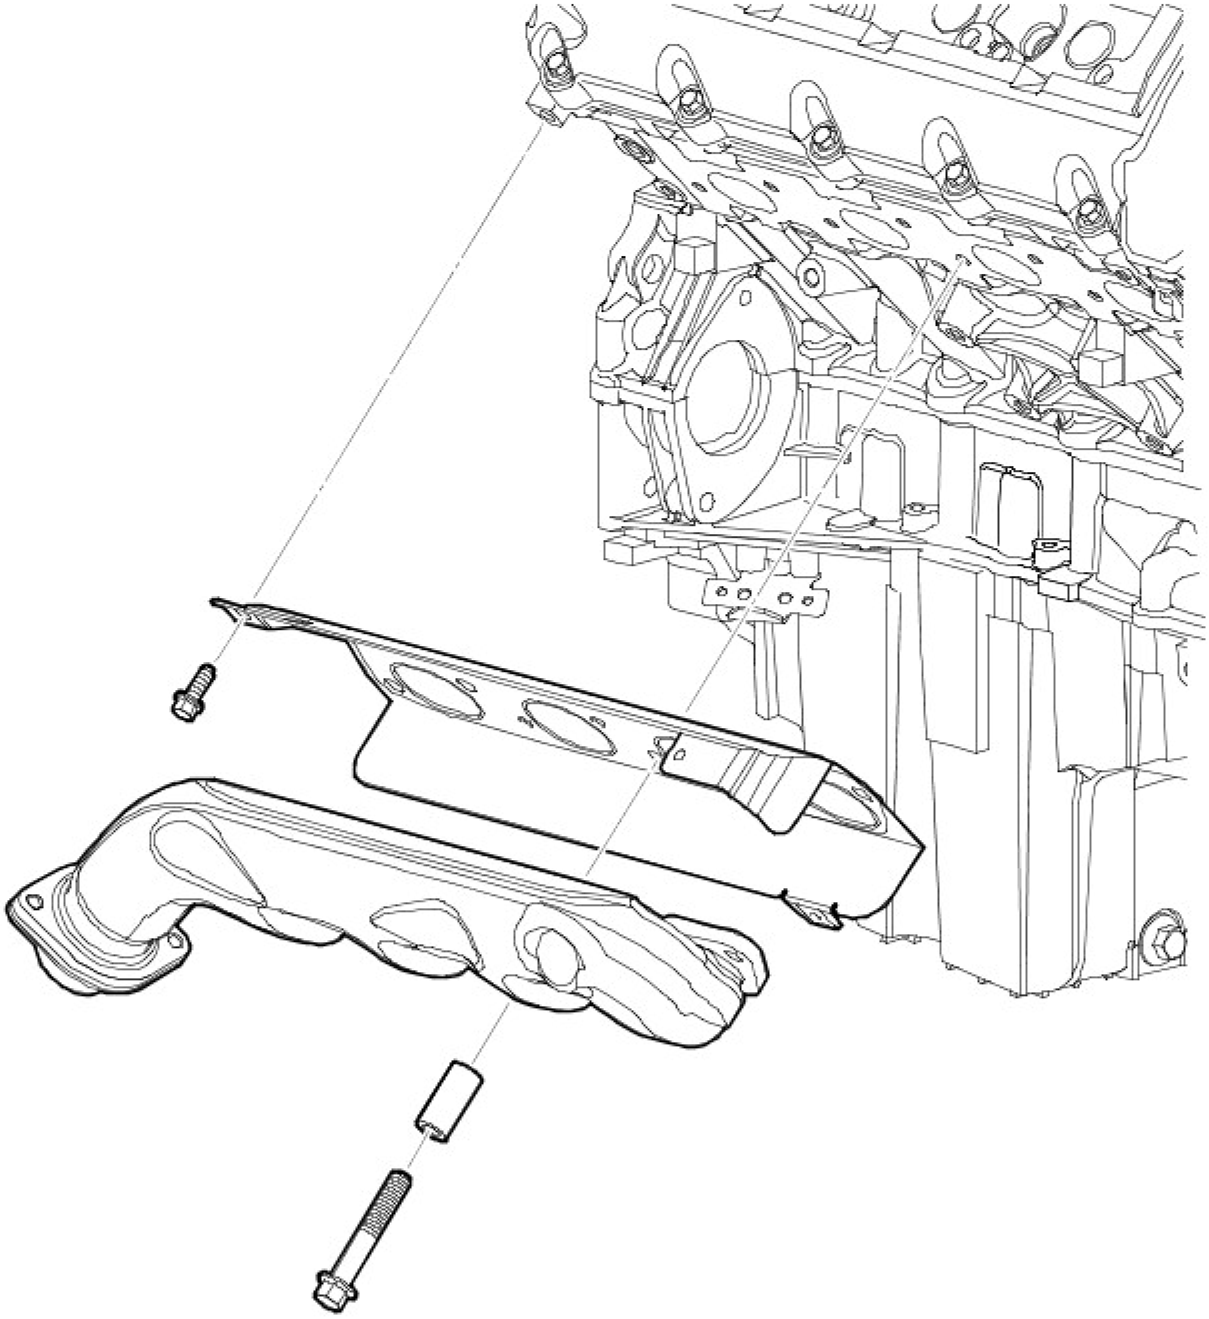
Oil Level Gauge



Item	Part Number	Description
1	-	Oil level gauge

The oil level gauge locates along the left side of the oil pan, supported in a tube installed in the sump. Two holes in the end of the gauge indicate the minimum and maximum oil levels. There is a difference of approximately 1.5 litres (1.58 US quart) between the two levels.

EXHAUST MANIFOLD



E43459

The fabricated stainless steel twin skin exhaust manifolds are unique for each cylinder bank. The bank 'B' manifold has a connection for the EGR transfer pipe.

Spacers on the securing bolts allow the manifolds to expand and retract with changes of temperature while maintaining the clamping loads.

Heat shields are integrated into the exhaust manifold gaskets.

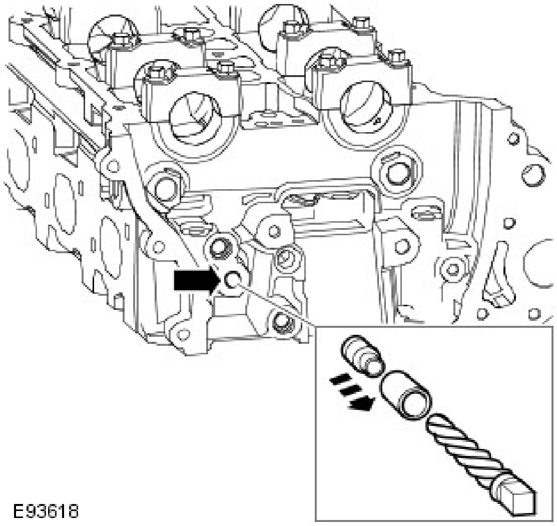
- Remove the 8 bolts.
- Discard the gasket and the bolts.

Installation



E93618

1. CAUTIONS:

⚠ If a new cylinder head is to be installed to a vehicle with variable valve timing (VVT), the cylinder head must have the oil gallery blind rivet removed before installation.

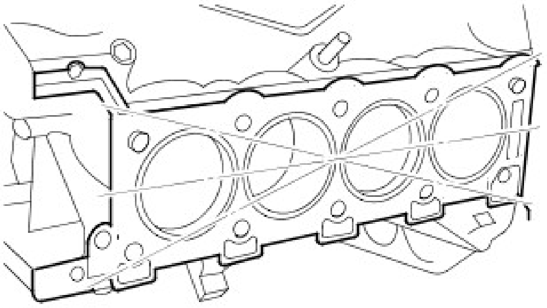
⚠ Make sure that all debris and foreign material is removed from the cylinder head and cylinder head oil gallery.

• NOTE: The centre bore of the blind rivet is 6 mm (0.24 inch) diameter.

Vehicles fitted with VVT: remove the blind rivet from the VVT oil gallery.

- Identify the VVT oil supply gallery and the 8 mm (0.31 inch) blind rivet.
- Using a suitable 3 mm (0.12 inch) punch release the centre of the blind rivet until it is released from the outer part of the blind rivet.
- Using a suitable extraction tool, remove the remaining part of the blind rivet.

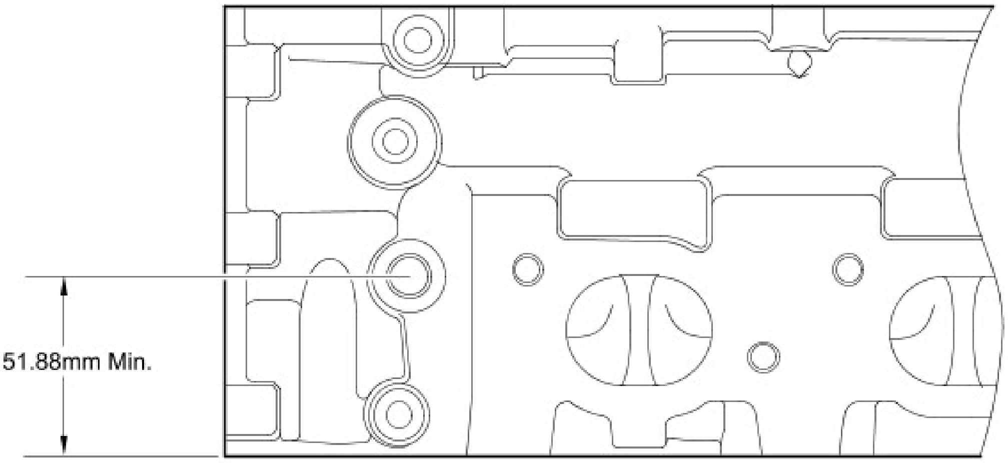
2. Clean the component mating faces.



E46855

3. Check cylinder head face for distortion, across the center and from corner to corner.

4. For cylinder head face distortion data, refer to specifications.
For additional information, refer to: Specifications (303-01B Engine - V8 4.4L Petrol, Specifications).

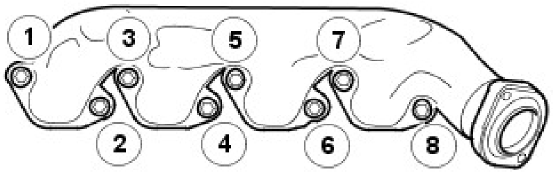


E100333

5. NOTE: For cylinder head with distortion above the maximum allowance, the cylinder head material must be measured.

Measure the cylinder head material.

- Check measurement from the centre of the exhaust dowel to the cylinder head face as shown.
- If the measurement is less than 51.88 mm the cylinder head requires replacement.



E47144

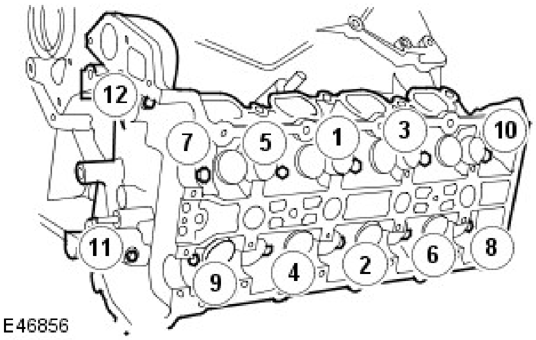
6. Install the exhaust manifold.

- Clean the component mating faces.
- Install the gasket/heat shield.
- Tighten the heat shield bolt to 25 Nm (18 lb.ft).
- Evenly and progressively, tighten the bolts in the sequence shown to 20 Nm (15 lb.ft).

7. CAUTION: The head gasket must be installed over the cylinder block dowels.

Install a new cylinder head gasket.

8. With assistance install the cylinder head.



9. NOTE: Tighten the bolts 1 to 10 in the sequence shown.

Install the cylinder head bolts.

- Lubricate the new cylinder head bolt threads with clean engine oil.
- Tighten the bolts to 20 Nm (15 lb.ft).
- Tighten the bolts to 35 Nm (26 lb.ft).
- Tighten the bolts 1 to 10, a further 90 degrees.
- Tighten the bolts 1 to 10, a further 90 degrees.
- Tighten the M8 bolts 11 and 12, to 25 Nm (18 lb.ft).

5. Install the valve cover retaining bolts.

- Install valve cover retaining bolts to their position previously noted.
- Complete the tightening sequence as illustrated.
- Tighten the bolts to 12 Nm (9 lb.ft).

6. Connect the VCT oil solenoid electrical connector.

7. Attach the engine wiring harness to the retaining bracket.

8. With assistance, install the oil level indicator and tube.

- Clean the component mating faces.
- Install a new O-ring seal.
- Lubricate the seal with clean engine oil.
- Tighten the nut to 6 Nm (4 lb.ft).

9. Install the ignition coil-on-plug.
For additional information, refer to: Ignition Coil-On-Plug (303-07B Engine Ignition - V8 4.4L Petrol, Removal and Installation).

21. NOTE: Note the orientation of the crankshaft sprocket.

Remove the crankshaft sprocket.

- Remove the crankshaft sprocket key.

Installation

1. Install the crankshaft sprocket key.

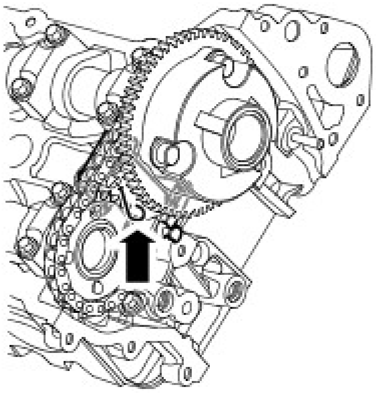
- Clean the component mating faces.

2. Install the crankshaft sprocket.

3. Depress the LH secondary timing chain tensioner piston.

- Using 1 mm diameter metal rod, retain the chain tensioner piston.

4. NOTE: RH illustration shown, LH is similar.



E46869

Install the LH secondary timing chain tensioner and chain to the camshaft sprockets.

5. Install the LH secondary timing chain tensioner retaining bolts.

- Tighten the bolts to 12 Nm.

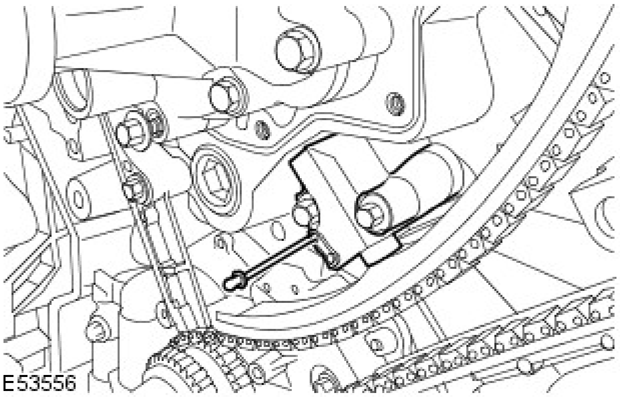
6. Install the LH primary timing chain.

- Make sure the timing chain slack is on the tensioner side of the timing chain.

7. Install the LH primary timing chain tensioner guides.

- Tighten the bolts to 12 Nm.

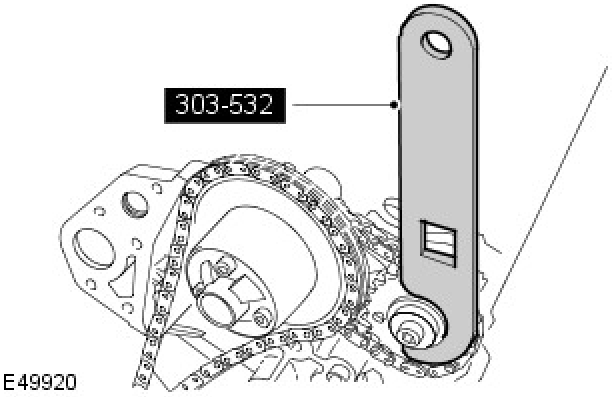
8. ⚠ CAUTION: During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.



E53556

Install the LH primary timing chain tensioner.

- Using 3 mm diameter metal rod, retain the chain tensioner piston.
- Tighten the bolts to 12 Nm.
- Remove the retaining rod.



9. CAUTIONS:

⚠ Using the special tool, apply force to the tool in a counter-clockwise direction, to tension the primary timing chain on its drive side.

⚠ The intake camshaft sprocket retaining bolt MUST be tightened before the exhaust camshaft sprocket retaining bolt. Engine damage will occur if this procedure is not followed.

⚠ Make sure that new bolts are installed.

Install the special tool to the LH exhaust camshaft sprocket.

- Tighten the intake camshaft sprocket retaining bolt to 20 Nm + 90 deg.
- Tighten the exhaust camshaft sprocket retaining bolt to 20 Nm + 90 deg.

10. Install the LH VCT control solenoid housing.

- Install the new O-ring seals.
- Tighten the new bolts to 22 Nm.
- Tighten the nut to 10 Nm.

13. Retain the RH secondary timing chain tensioner piston.

- Using 1 mm diameter metal rod, retain the chain tensioner piston.

14. Install the RH secondary timing chain tensioner and the secondary timing chain to the camshaft sprockets.

15. NOTE: Lightly tighten the camshaft sprocket Torx bolts, the sprockets MUST be free to move.

Install the RH secondary timing chain and sprockets to the camshafts.

- Install the sprocket retaining Torx bolts to the camshafts.

16. Install the RH secondary timing chain tensioner retaining bolts.

- Tighten the bolts to 12 Nm.

17. Tension the secondary timing chain.

- Remove the retaining rod.

18. Install the RH primary timing chain.

- Make sure the timing chain slack is on the tensioner side of the timing chain.

19. Install the RH primary timing chain tensioner guide.

- Tighten the bolts to 12 Nm.

20. ⚠ CAUTION: During timing chain tensioner compression, do not release the ratchet stem until the timing chain tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Install the RH primary timing chain tensioner.

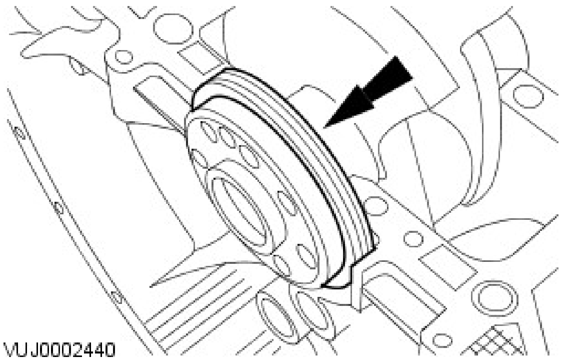
67. CAUTION: To make sure damage does not occur to the crankshaft and piston components, the engine must be inverted on the engine stand. Failure to follow this instruction may result in damage to the engine.

• NOTE: If the crankshaft main bearing carrier retaining bolts have been marked with a center punch dot, they must be discarded and new bolts installed.

Remove the crankshaft main bearing carrier.

- Remove the crankshaft main bearing carrier retaining bolts in the indicated sequence.



VUJ0002440

68. Discard the crankshaft rear main oil seal.

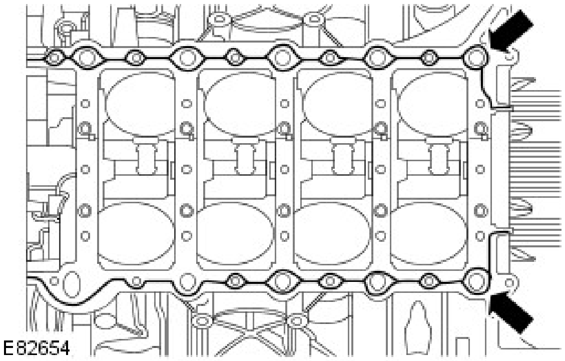
Installation

1. CAUTIONS:

Use only a plastic scraper when removing the sealing material.

If any new bolts are to be installed to retain the crankshaft main bearing carrier, pre-stress the retaining bolts by installing the crankshaft main bearing carrier without any sealant and tightening the new retaining bolts to the specified torque. Remove the crankshaft main bearing carrier once the bolts have been pre-stressed. Failure to follow this instruction may result in damage to the vehicle.

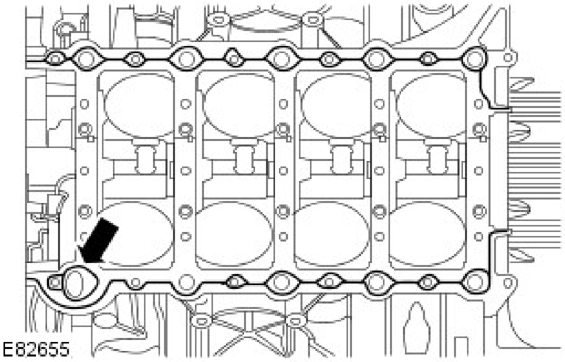
Clean all the mating faces and reusable parts thoroughly and check for damage.



2. NOTE: Install the crankshaft main bearing carrier and tighten bolts to specification within twenty minutes of applying the sealant.

Apply a 2 mm (0.08in) bead of sealant to the cylinder block in the area shown.

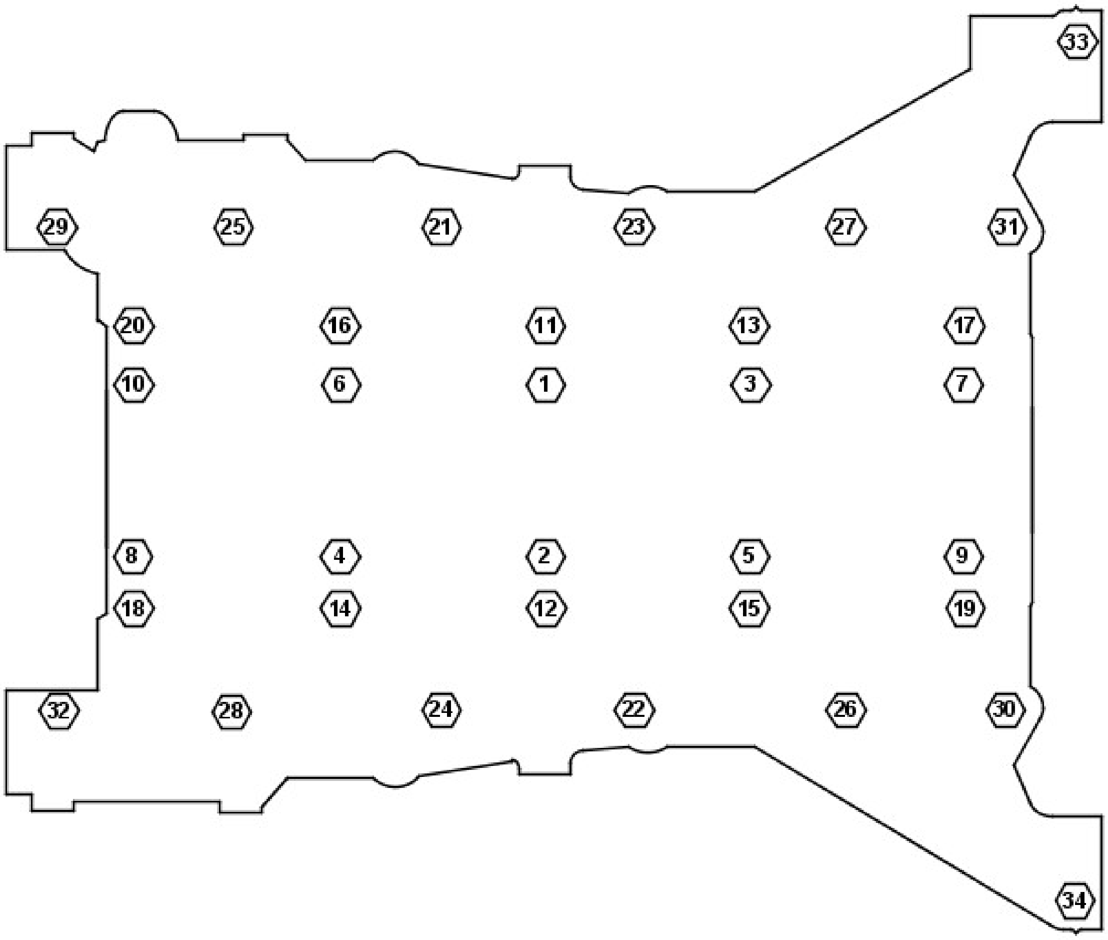
- Use WSS-M4G323-A4-RTV sealant.



3. NOTE: Install the crankshaft main bearing carrier and tighten bolts to specification within twenty minutes of applying the sealant.

Apply a 1 mm (0.039in) bead of sealant to the cylinder block in the area shown.

- Use WSS-M4G323-A4-RTV sealant.



VUJ0002450

4. ⚠ CAUTION: Make sure all dowels are fully seated into the crankshaft main bearing carrier prior to tightening the bolts.

- NOTE: Do not lubricate the crankshaft main bearing carrier retaining bolts.
- NOTE: Do not rotate the crankshaft until all the retaining bolts are tightened to specification.
- NOTE: The retaining bolts must be tightened within twenty minutes of applying the sealant.
- NOTE: Tighten the retaining bolts in the sequence shown.

Install the crankshaft main bearing carrier to the cylinder block.

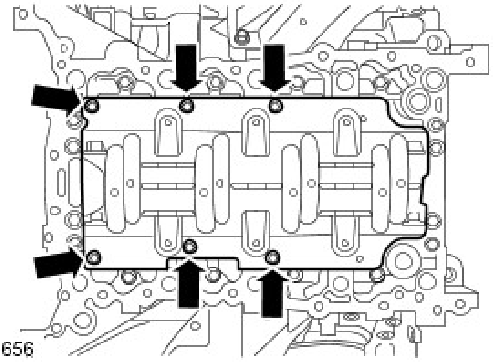
1. Stage 1: Bolts 21 to 32, tighten to 15 Nm (11 lb.ft).
2. Stage 2: Bolts 33 to 34, tighten to 15 Nm (11 lb.ft).
3. Stage 3: Bolts 1 to 10, tighten to 25 Nm (18 lb.ft).
4. Stage 4: Bolts 11 to 20, tighten to 15 Nm (11 lb.ft).
5. Stage 5: Bolts 1 to 10, tighten to 35 Nm (26 lb.ft), then a

further 135 degrees.

6. Stage 6: Bolts 11 to 20, tighten to 20 Nm (15 lb.ft), then a further 150 degrees.
7. Stage 7: Bolts 21 to 32, tighten to 20 Nm (15 lb.ft), then a further 90 degrees.
8. Stage 8: Bolts 33 to 34, tighten to 20 Nm (15 lb.ft), then a further 150 degrees.
9. Stage 9: Center punch each of the bolt heads to indicate it has been reused.

5. Rotate the crankshaft to check correct operation.

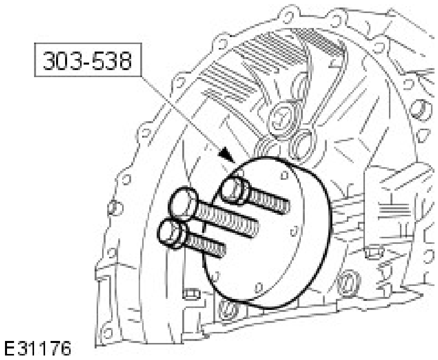
6. Remove excess sealant which may squeeze out at the front cover sealing surfaces.



E82656

7. Install the baffle plate.

- Tighten the 6 bolts to 6 Nm (4 lb.ft).

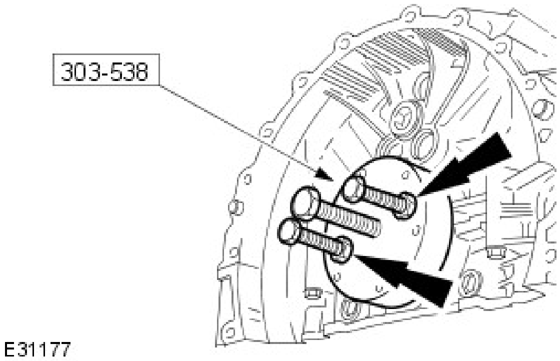


8. NOTE: Carefully remove the transit sleeve, leaving the seal in place.

• NOTE: Make sure that the transit sleeve is correctly positioned and install the new seal over the crankshaft. Do not use any lubricant on the seal, the transit sleeve or the crankshaft.

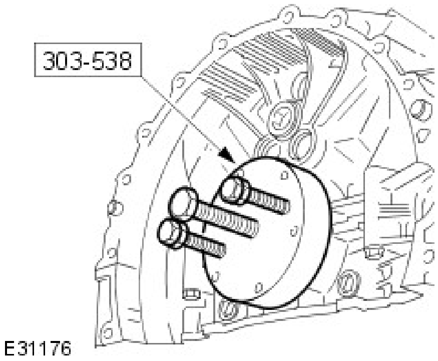
Using the special tool, position the crankshaft rear oil seal.

- Install the special tool to the crankshaft.



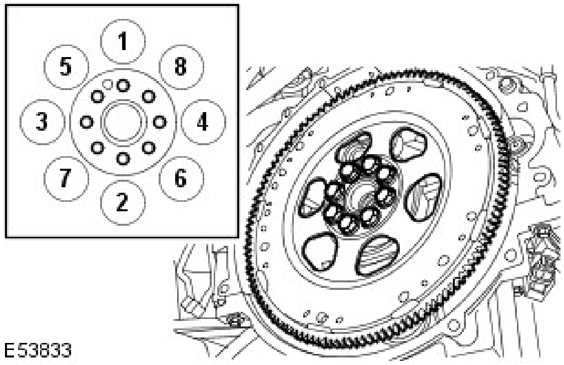
9. ⚠ CAUTION: Alternate the nut tightening to correctly seat the crankshaft rear oil seal.

Using the special tool, install the rear crankshaft oil seal.



10. ⚠ CAUTION: Make sure that the crankshaft rear oil seal is correctly located.

Remove the special tool.



11. NOTE: Prevent the flexplate from rotating.

Install the torque converter flexplate.

- Clean the component mating faces.
- Tighten the bolts evenly in 2 stages to the sequence shown.

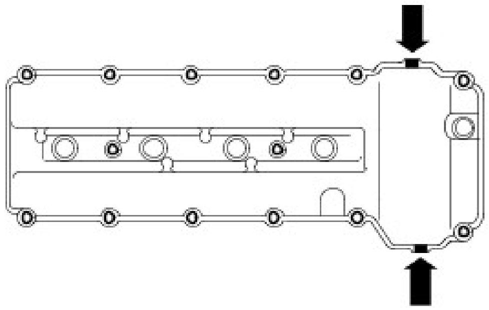
38. NOTE: Install a new gasket.

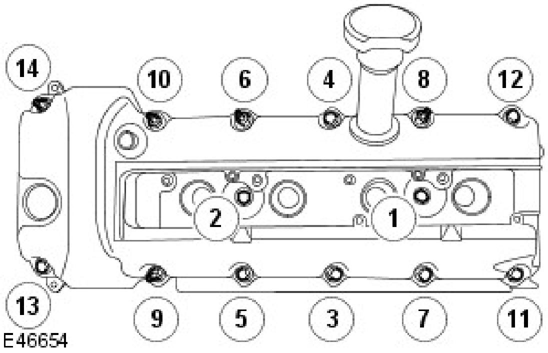
• NOTE: Apply two beads of silicone gasket sealant as shown on the illustration. The application of the sealant must be 3 mm (0.118 in) diameter 12 mm (0.47 in) long. Install the valve cover immediately after applying the sealant. The cover should be fitted directly to the head without smearing the sealant or the seals.

Install the LH valve cover.

- Clean the component mating faces.
- Install the valve cover gasket.



E49922



39. Install the LH valve cover bolts.

- Install the LH valve cover bolts to the positions previously noted.
- Tighten the bolts in the sequence shown to 12 Nm (9 lb.ft).

40. Connect the LH VCT oil solenoid electrical connector.

41. Attach the engine wiring harness to the retaining bracket.

42. NOTE: Install a new O-ring seal.

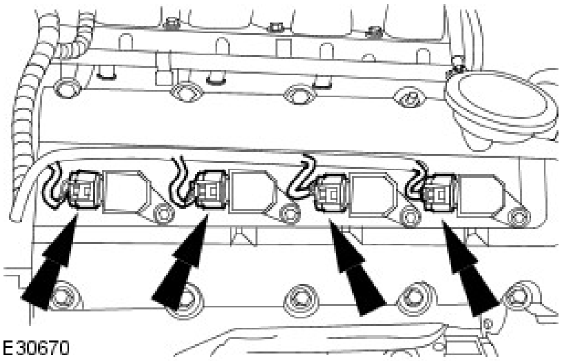
With assistance, install the oil level indicator and tube.

- Clean the component mating faces.
- Install the O-ring seal.
- Lubricate the O-ring seal with clean engine oil.
- Tighten the nut to 6 Nm (4 lb.ft).

43. NOTE: Install new O-ring seals.

Install the 4 LH ignition coil-on-plugs.

- Install the O-ring seals.
- Install the 4 ignition coil-on-plugs.
- Tighten the bolts to 6 Nm (4 lb.ft).

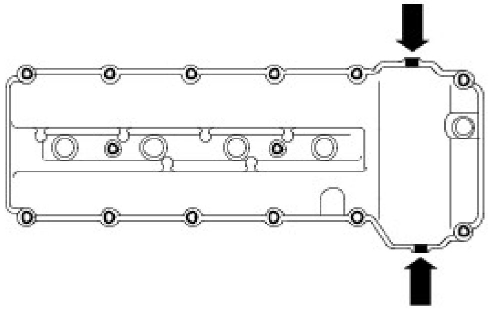


44. Connect the 4 electrical connectors.

45. Install the LH ignition coil-on-plug cover.

46. NOTE: Install new seals.

Install new RH valve cover plug aperture seals.



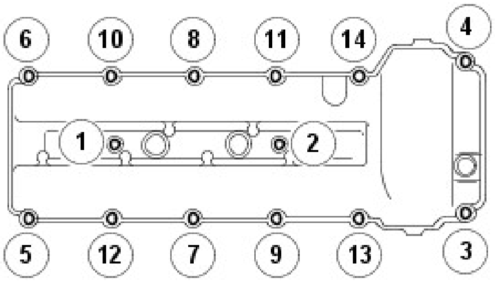
E49922

47. NOTE: Install a new gasket.

• NOTE: Apply two beads of silicone gasket sealant as shown on the illustration. The application of the sealant must be 3 mm (0.118 in) diameter 12 mm (0.47 in) long. Install the valve cover immediately after applying the sealant. The cover should be fitted directly to the head without smearing the sealant or the seals.

Install the RH valve cover.

- Clean the component mating faces.
- Install the gasket.



E46679

48. Install the RH valve cover bolts.

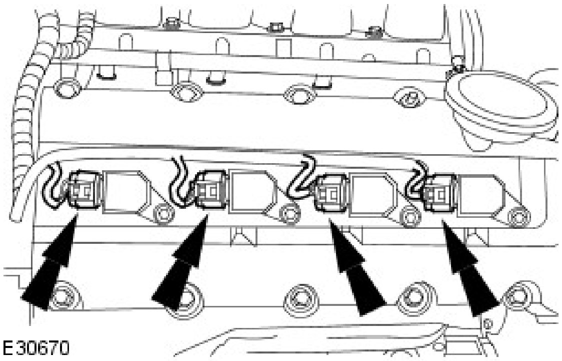
- Install the RH valve cover bolts to the positons previously noted.
- Tighten the bolts in the sequence shown to 12 Nm (9 lb.ft).

49. NOTE: Install new O-ring seals.

Install the 4 RH ignition coil-on-plugs.

- Install the O-ring seals.
- Install the 4 ignition coil-on-plugs.
- Tighten the bolts to 6 Nm (4 lb.ft).

50. Connect the 4 electrical connectors.



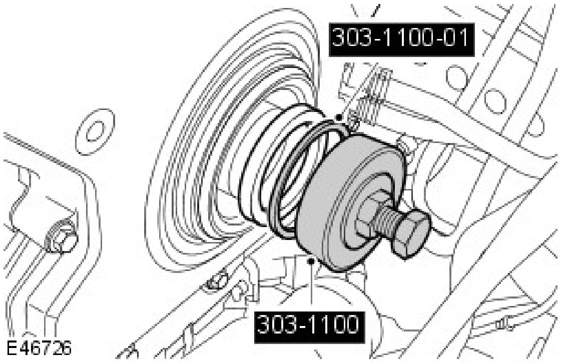
E30670

51. Connect the RH VCT oil solenoid electrical connector.

52. Attach the engine wiring harness to the retaining bracket.

53. Connect the PCV line to the RH valve cover.

54. Clean the crankshaft pulley mating faces.



55. Using the special tool, install the crankshaft front seal.

- Lubricate the seal with clean engine oil.
- Use the discarded crankshaft bolt with the special tool.
- Remove the special tools.

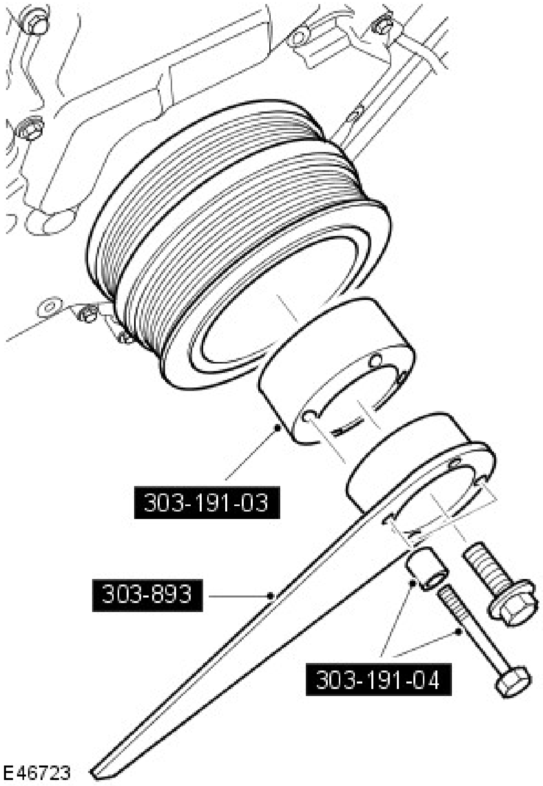
56. Install the crankshaft pulley.

- Lubricate the seal with clean engine oil.

57. Install the crankshaft pulley locking ring.

58. ⚠CAUTION: The screw thread in the crankshaft pulley must be cleaned out before installing a new crankshaft pulley bolt.

Install, but do not tighten, the new crankshaft pulley bolt.



59. ⚠CAUTION: Under no circumstances should the crankshaft setting peg, 303-645, be used in the following operations, to restrain the crankshaft.

Using the special tools, tighten the crankshaft pulley bolt.

- Tighten the crankshaft pulley bolt to 380 Nm (280 lb.ft).
- Remove the special tools.

60. Install the oil filter housing.

- Clean the component mating faces.
- Install a new O-ring seal.
- Tighten the bolts to 20 Nm (15 lb.ft).

61. Install the engine oil filter.

- Lubricate the oil filter seal with clean engine oil and tighten to 18 Nm (13 lb.ft).

62. Connect the EOP sensor electrical connector.

63. Connect the engine oil temperature sensor electrical connector.

64. Install the generator mounting bracket.

- Tighten the 4 bolts to 45 Nm (33 lb.ft).

65. Install the generator.

- Tighten the 3 bolts to 48 Nm (35 lb.ft).
- Connect the electrical connector.

66. Connect the battery positive cable.

- Tighten the nut to 10 Nm (7 lb.ft).
- Install the battery positive cable cover.

67. Install the exhaust manifold heat shield.

- Tighten the 2 bolts.

68. Install the accessory drive belt idler pulleys.

- Tighten the bolts to 25 Nm (18 lb.ft).

69. Install the coolant pump pulley.

- Tighten the bolts to 10 Nm (7 lb.ft).

70. NOTE: Install new O-ring seals.

Install the coolant manifold.

- Clean the components.
- Install the O-ring seals.
- Connect the 4 coolant hoses and install the clips.
- Attach the wiring harness bracket.
- Tighten the 2 bolts to 10 Nm (7 lb.ft).

71. Connect the ECT sensor electrical connector.

72. Install the cooling fan drive belt tensioner.

- Tighten the bolt to 40 Nm (30 lb.ft).

73. Install the A/C compressor mounting bracket.

- Tighten the bolts to 25 Nm (18 lb.ft).

74. Remove the engine from the engine stand.

75. Install the engine.

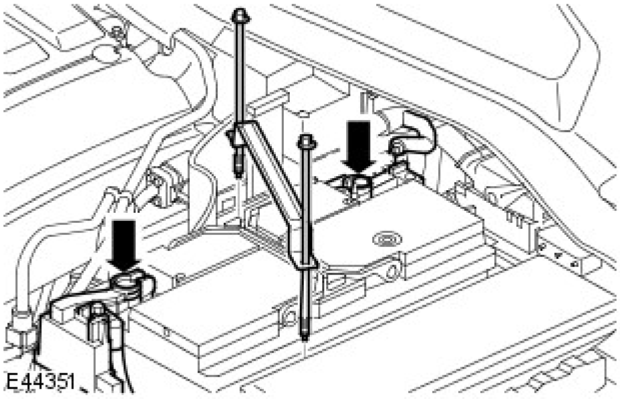
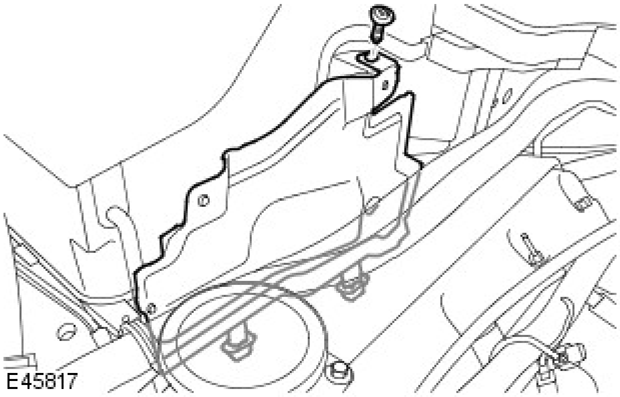
Special Tool(s)	
	Engine lifting cradle 303-1144
	Fuel spring lock decoupling tool 310-D005

Removal

1. Secure the hood in the service position.
2. Remove the engine cover.
   For additional information, refer to: Engine Cover - V8 4.4L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Remove the battery cover.
   - Release the 2 mounting clips.
4. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
5. Disconnect the battery positive cable.
6. Remove 2 bolts securing the battery clamp and remove the clamp.

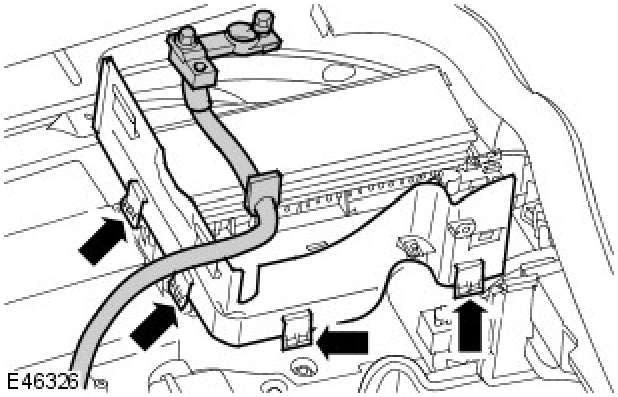


7. Remove the battery.



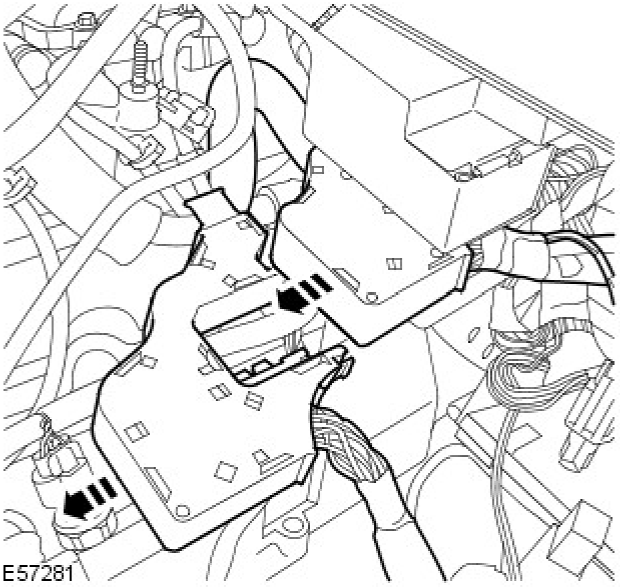
8. Remove the engine compartment upper heat shield.

- Remove the 2 screws.
- Release the 2 mounting clips.



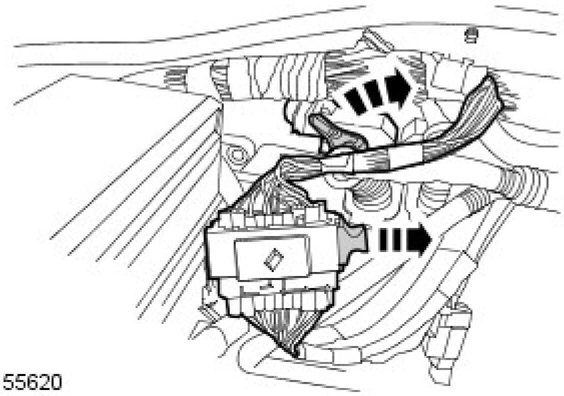
9. Remove the battery compartment side wall.

- Release the battery positive cable and grommet.
- Release the 4 clips.



10. Release the cassette.

- Release the 2 clips.



E55620

11. Disconnect the engine wiring harness.

- Release and disconnect the 2 electrical connectors.

12. Remove the RH air cleaner assembly.
For additional information, refer to: Air Cleaner (303-12B Intake Air Distribution and Filtering - V8 4.4L Petrol, Removal and Installation).

13. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

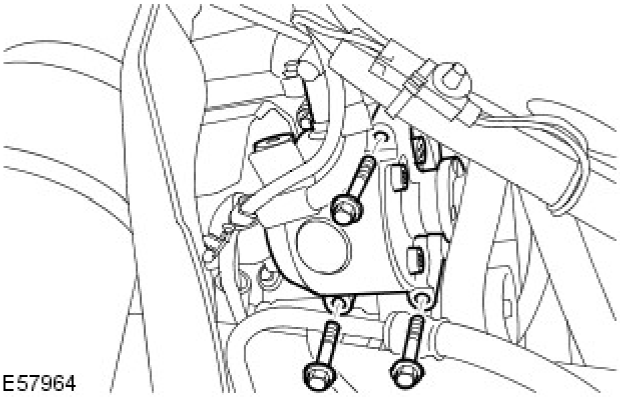
Raise and support the vehicle.

14. Remove the fender splash shields.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

15. Remove the generator.
For additional information, refer to: Generator (414-02B Generator and Regulator - V8 4.4L Petrol, Removal and Installation).

16. Release the dynamic response pump and tie aside.

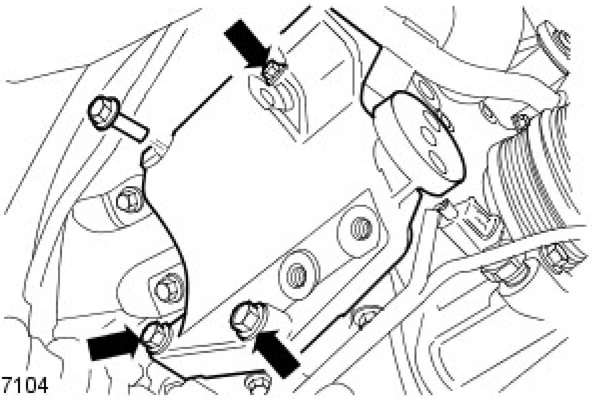
- Remove the 3 bolts.



E57964

17. Remove the dynamic response and generator mounting brackets.

- Remove the 8 bolts.

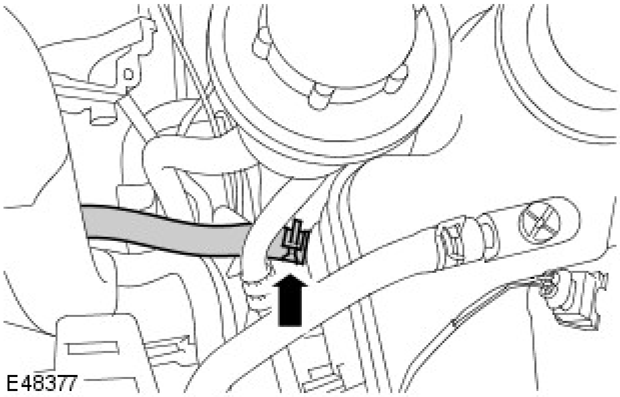


E47104

18. Drain the cooling system.
For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03B Engine Cooling - V8 4.4L Petrol, General Procedures).

19. Drain the engine oil.
For additional information, refer to: Engine Oil Draining and Filling (303-01A Engine - V8 S/C 4.2L Petrol, General Procedures).

20. Remove the exhaust system.
For additional information, refer to: Exhaust System (309-00B Exhaust System - V8 4.4L Petrol, Removal and Installation).

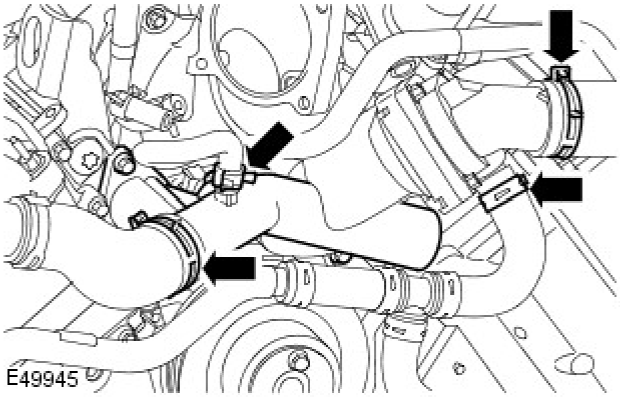


21. Disconnect the coolant expansion tank lower hose.

- Release the clip.

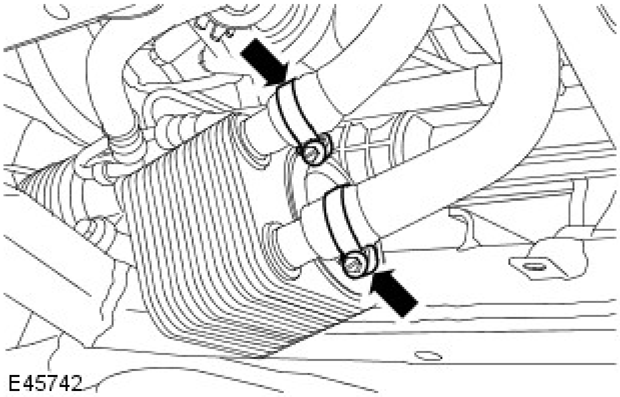
22. Disconnect the thermostat housing coolant hoses.

- Release the 2 clips.



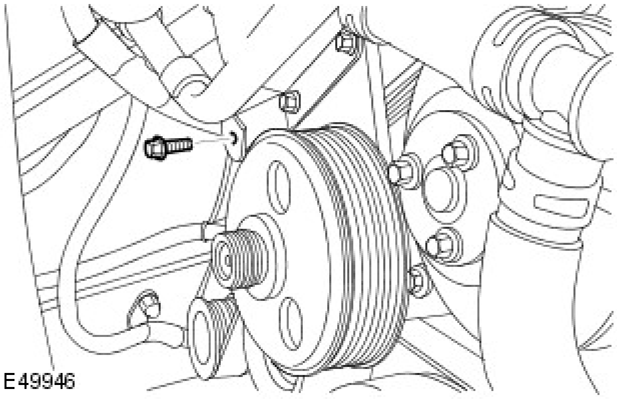
23. Disconnect the upper coolant hose assembly.

- Release the 2 clips.



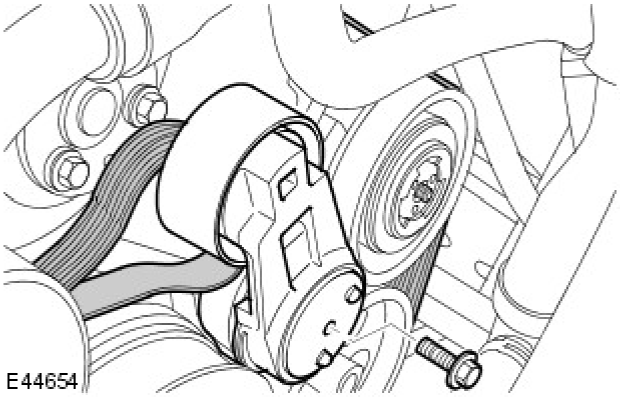
24. Disconnect the engine oil cooler coolant hoses.

- Release the 2 clips.
- Remove the hose assembly.



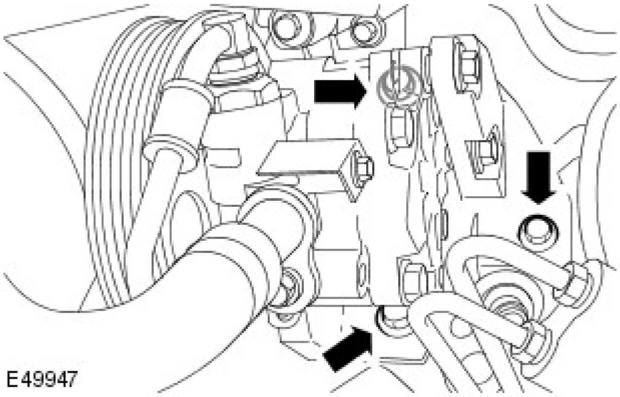
25. Tie the hose assembly aside for access.

- Remove the bolt.



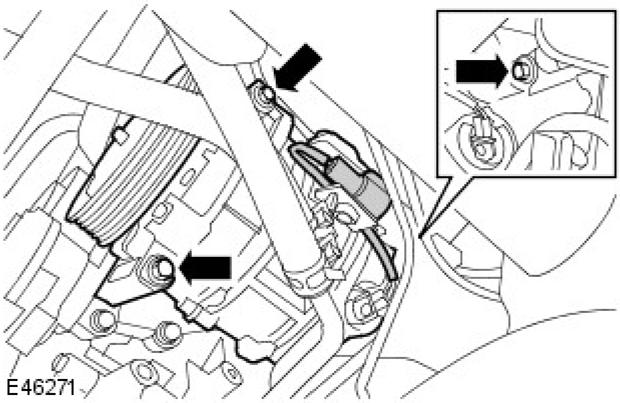
26. Remove the accessory drive belt tensioner.

- Remove the bolt.



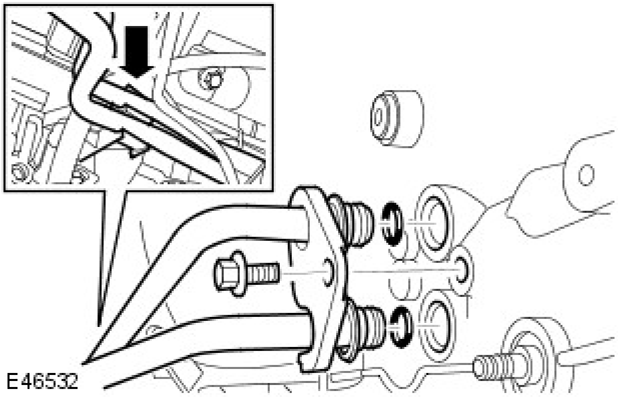
27. Release the power steering pump and tie aside

- Remove the 3 bolts.



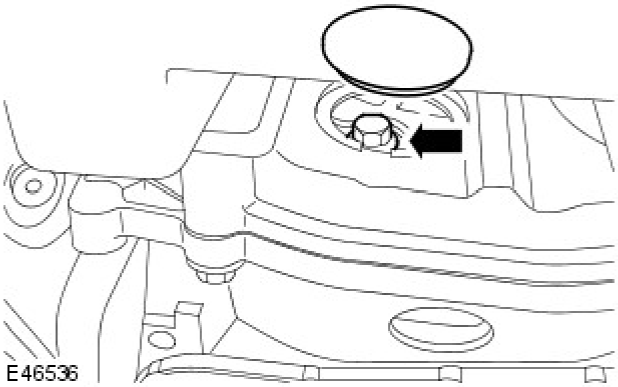
28. Release the A/C compressor and tie aside.

- Remove the 3 bolts.



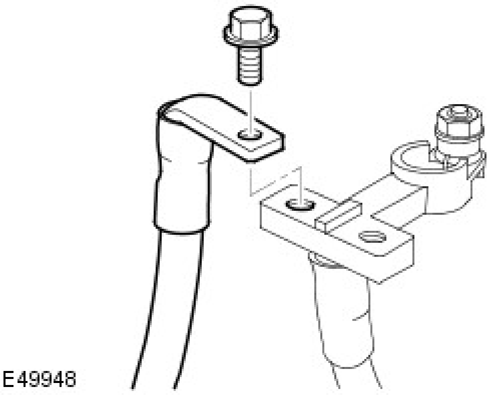
29. Release the transmission cooler pipes.

- Position a container to collect the fluid.
- Remove the bolt.
- Release the 2 clips.
- Move the transmission pipes aside.



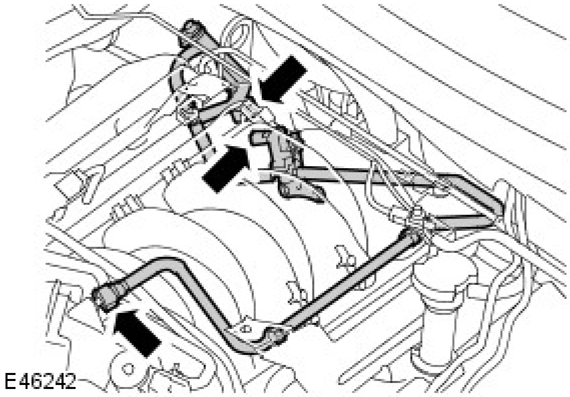
30. Release the flexplate.

- Remove the grommet.
- Rotate the crankshaft to access the retaining bolts.
- Remove the 3 bolts.



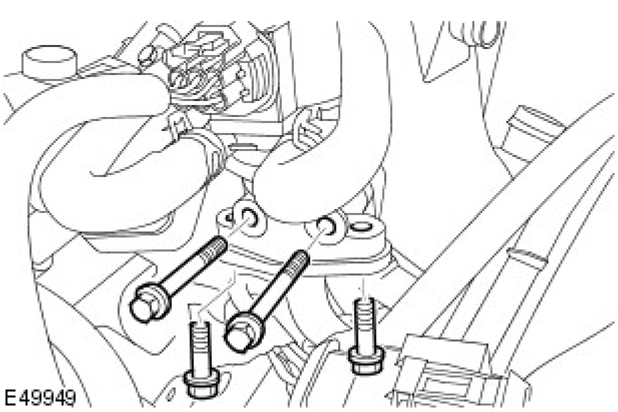
31. Disconnect the battery positive cable from the BJB.

- Remove the bolt.
- Position the positive cable aside.



32. Disconnect the evaporative emission hose from the intake manifold assembly.

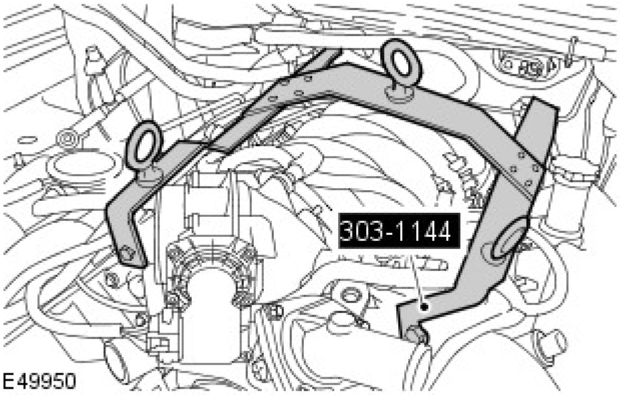
- Position the hose aside for access.



33. ⚠ CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Position the EGR valve aside.

- Remove the 4 bolts.
- Remove and discard the gasket.



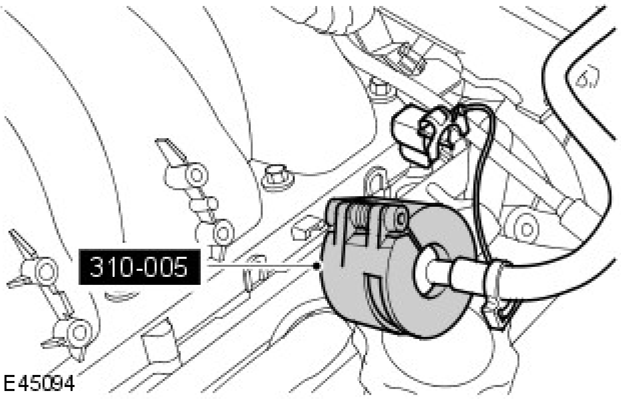
34. Install the special tool.

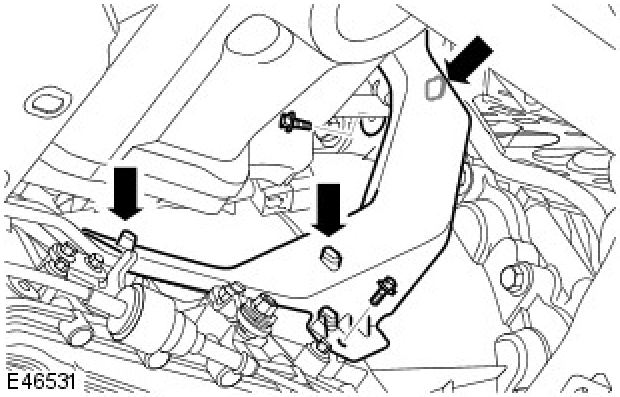
35. Depressurize the fuel rail.

- Position an absorbent cloth to collect fluid spillage.

36. Using the special tool, disconnect the fuel line.

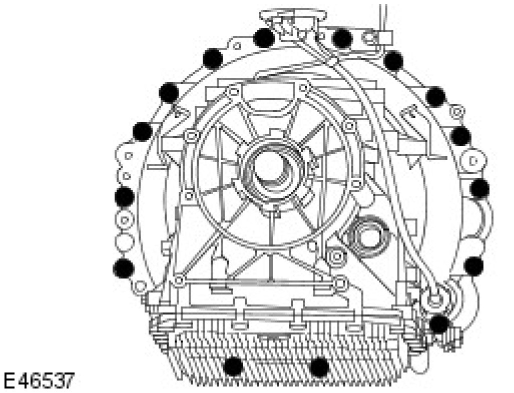
- Position the supply line aside.





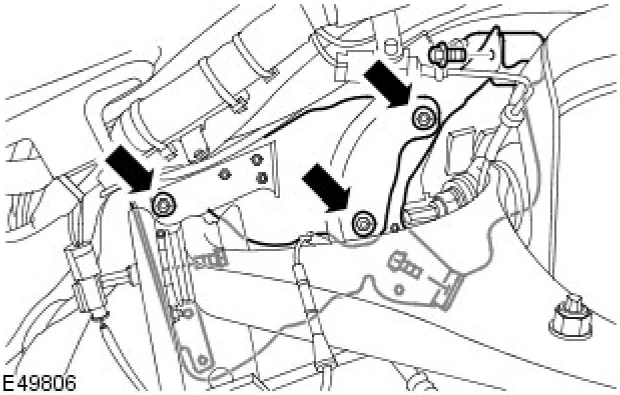
37. Release the heat shield for access to the transmission bolts.

- Remove the 2 bolts.
- Move the shield aside.



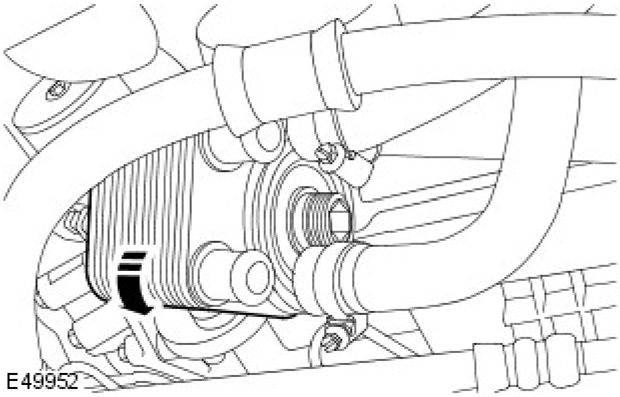
38. Remove the transmission bolts.

- Support the transmission.
- Remove the 16 bolts.

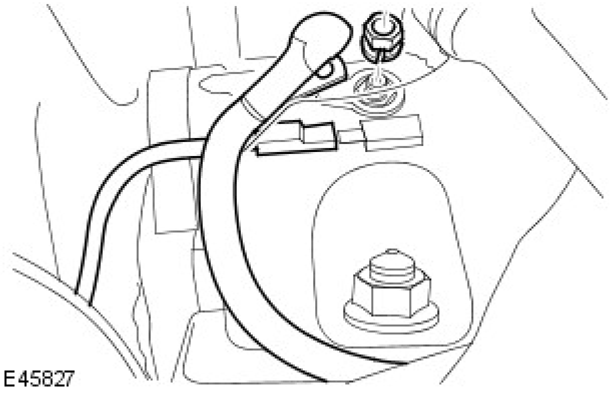


39. Remove the upper suspension arm and brake line heat shields for access.

- Remove the 3 bolts.
- Remove the 3 nuts.



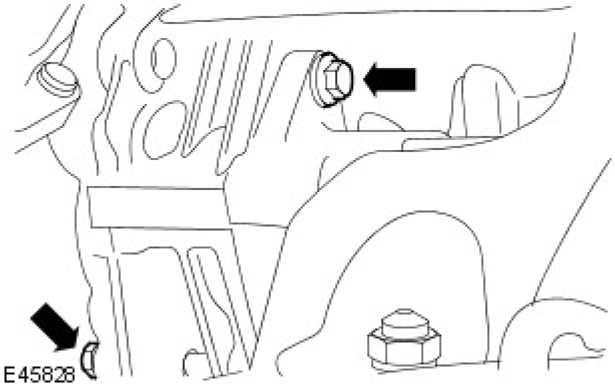
40. Loosen the Allen bolt and rotate the engine oil cooler aside for access.



E45827

41. Disconnect the starter motor electrical connections.

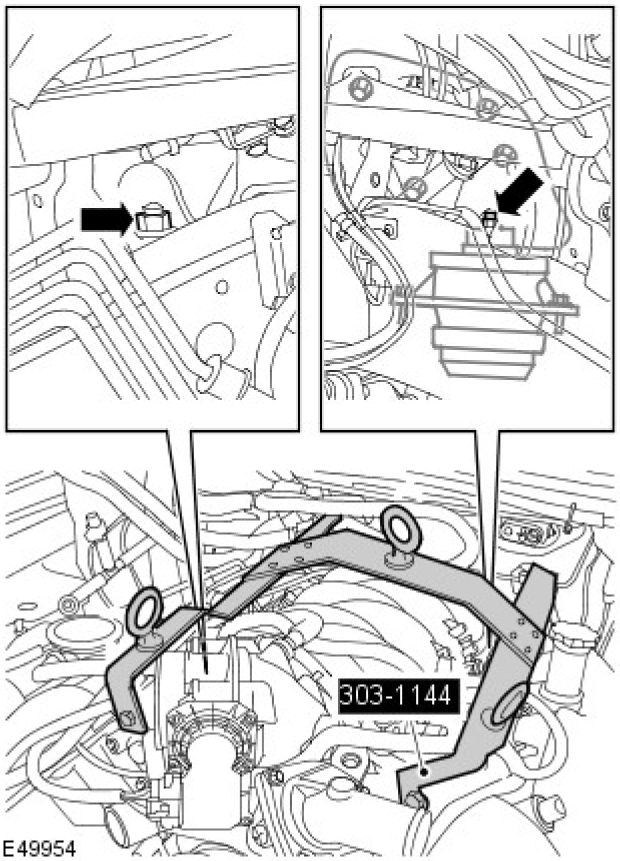
- Remove the nut.



E45828

42. Remove the starter motor.

- Remove the 2 bolts.

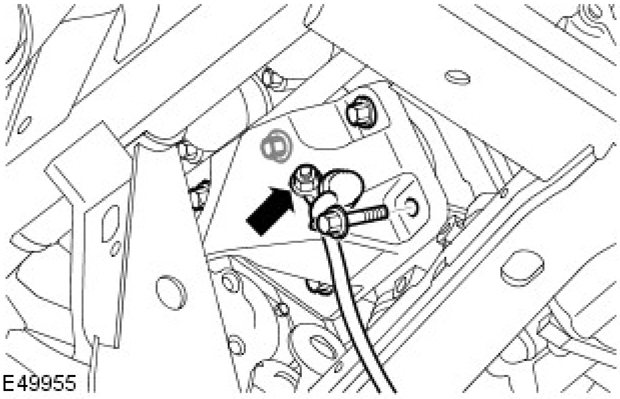


E49954

43. Remove the 2 engine mount nuts.

44. Release the engine from mounts and the transmission.

- Install the lifting chains.
- Raise the RH side of the engine by approximately 35 mm.



45. Remove the engine RH mount bracket.

- Remove 4 bolts securing the engine mount bracket to the cylinder block.
- Disconnect the engine ground cable from the RH mounting bracket.

46. CAUTIONS:

⚠ Make sure the torque converter remains connected to the transmission.

⚠ Care must be taken to avoid damaging the steering rack and differential.

Carefully and progressively raise and remove the engine.

47. Disconnect the lifting chains.

Installation

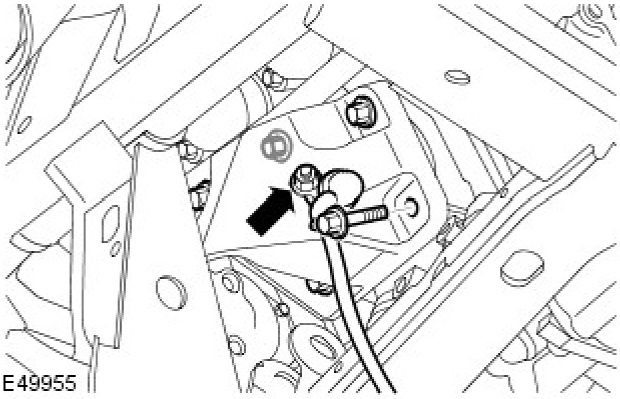
Special Tool(s)	
 E49956	Engine lifting cradle 303-1144

Installation

1. Install the engine lifting cradle.

- Connect the lifting chains.

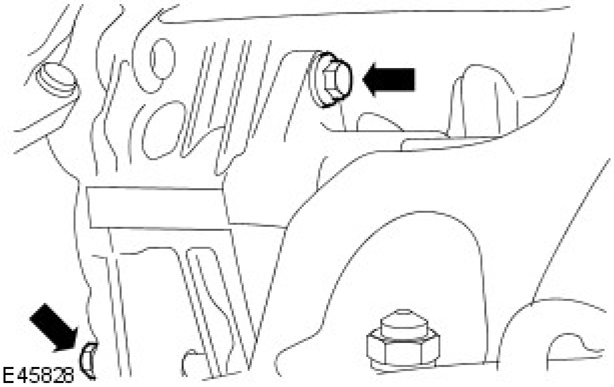
2. Carefully lower the engine until approximately 35mm above engine mounts.



E49955

3. Install the engine front mount bracket.

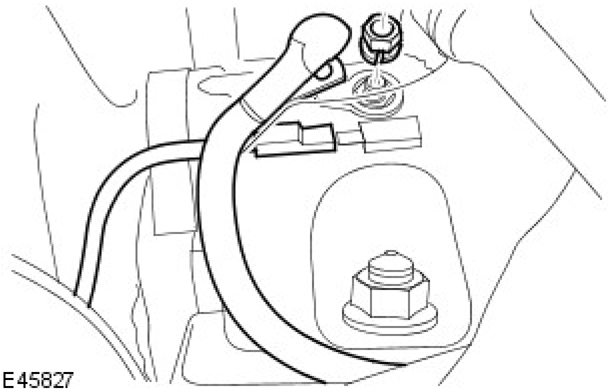
- Clean the component mating faces.
- Tighten the bolts to 45 Nm (33 lb.ft).
- Connect the engine ground cable and tighten the bolt to 25 Nm (18 lb.ft).



E45828

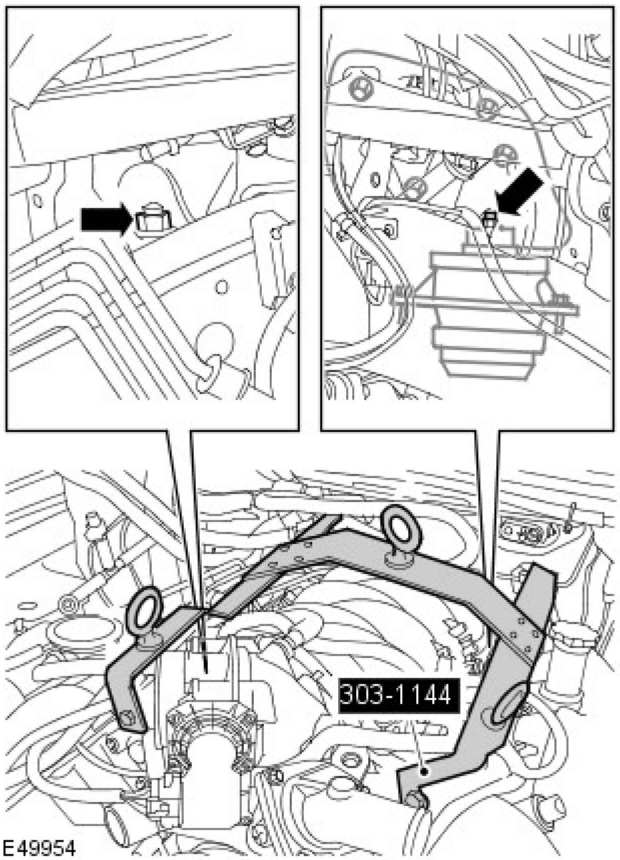
4. Install the starter motor.

- Tighten the bolts to 45 Nm (33 lb.ft).



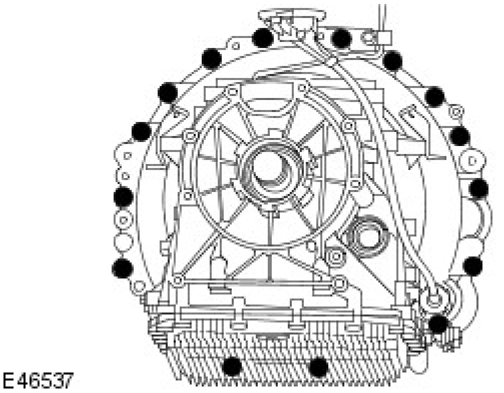
5. Connect the starter motor electrical connectors.

- Connect and secure the electrical connectors.
- Tighten the starter motor nut to 10 Nm (7 lb.ft).



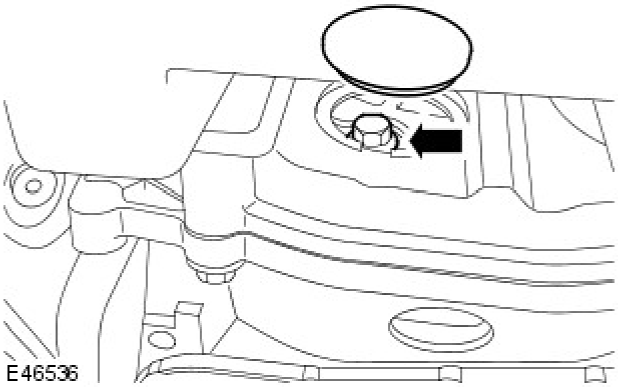
6. With assistance align the engine to the transmission and engine mounts.

- Tighten the engine mount nuts to 90 Nm (66 lb.ft).



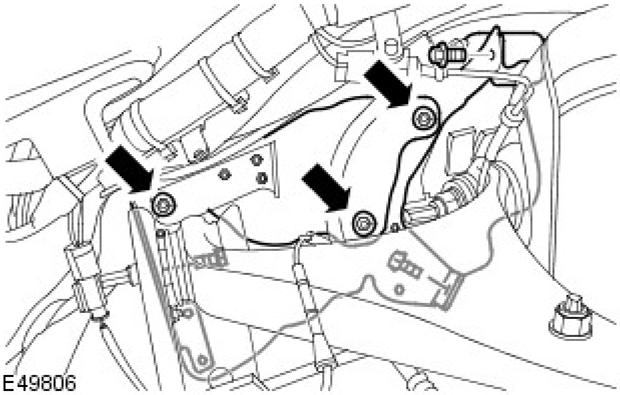
7. Install the transmission retaining bolts.

- Tighten the bolts to 45 Nm (33 lb.ft).



8. Attach the flexplate to the torque converter.

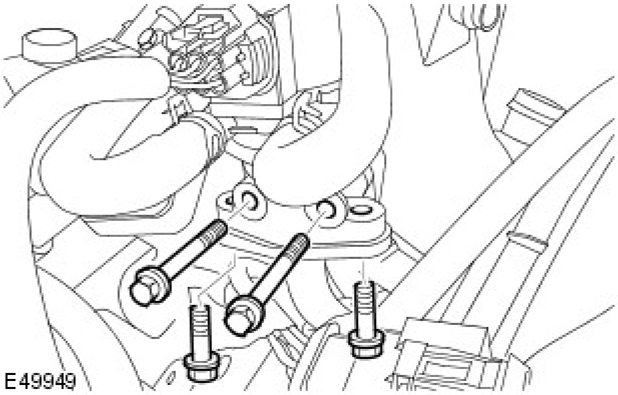
- Rotate the crankshaft to access the retaining bolts.
- Tighten the bolts evenly and progressively in 2 stages.
- Tighten the bolts to 15 Nm (11 lb ft).
- Tighten the bolts to 110 Nm (81 lb.ft).
- Install the grommet.



9. Install the transmission heat shield.

10. Install the upper suspension arm and brake line heat shields.

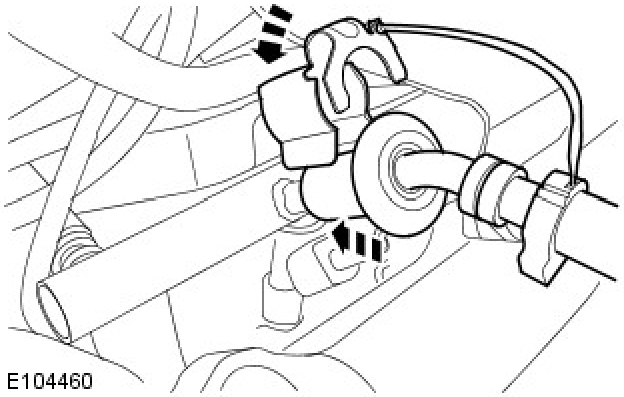
- Install the bolts and tighten to 10 Nm (7 lb.ft).
- Tighten the nuts to 10 Nm (7 lb.ft).



11. Remove the engine lifting cradle.

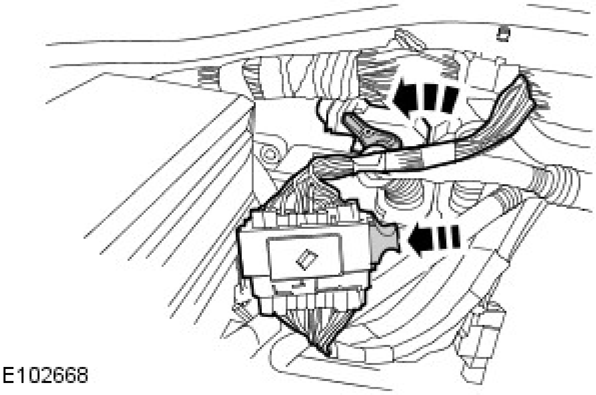
12. Position the EGR valve to the EGR pipe, fit the bolts and tighten to 25 Nm (18 lb.ft).

- Install and align new gasket.



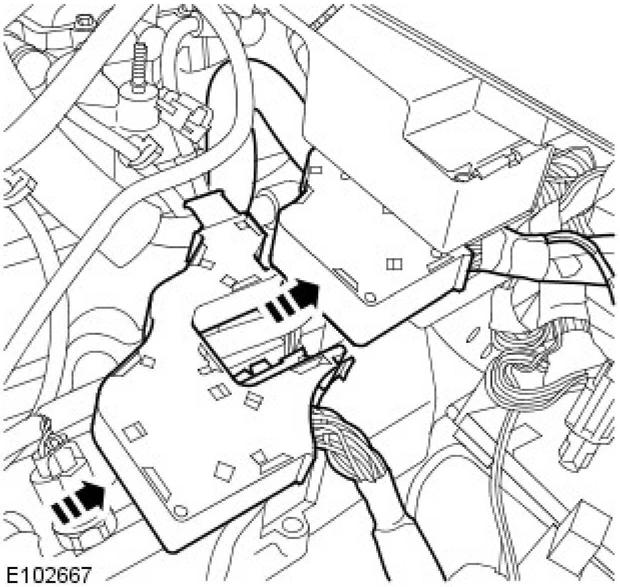
13. Connect the fuel line to the fuel rail.

- Clean the component mating faces.
- Secure with the clips.

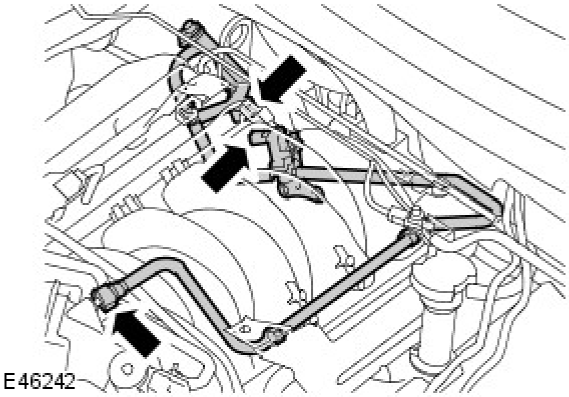


14. Connect the engine wiring harness.

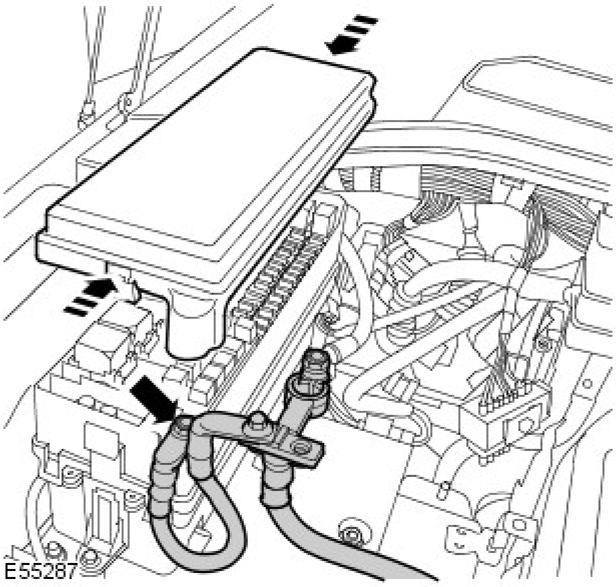
- Connect the electrical connectors.



15. Install the cassette.

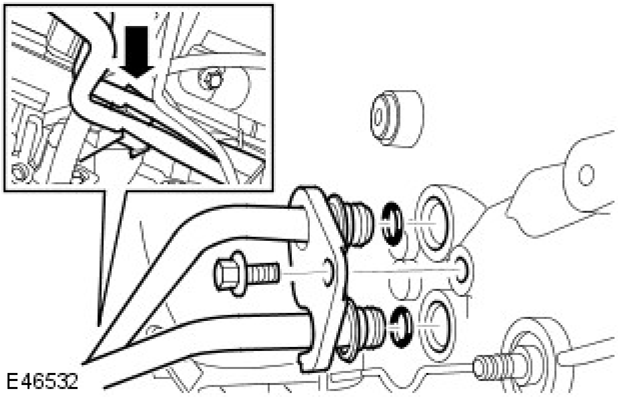


16. Connect the evaporative emission hose to the intake manifold.



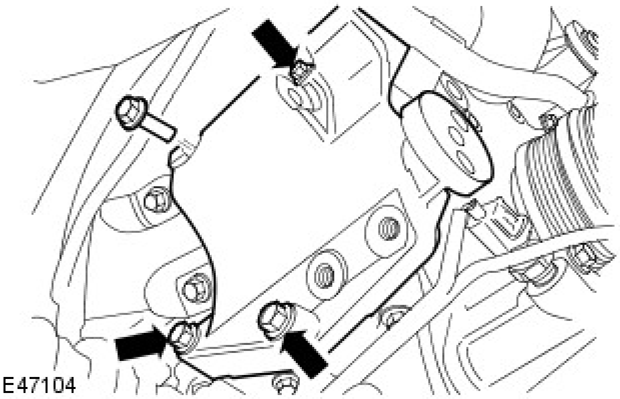
17. Connect the battery positive cable to the BJB.

- Tighten the bolt to 10 Nm (7 lb.ft).



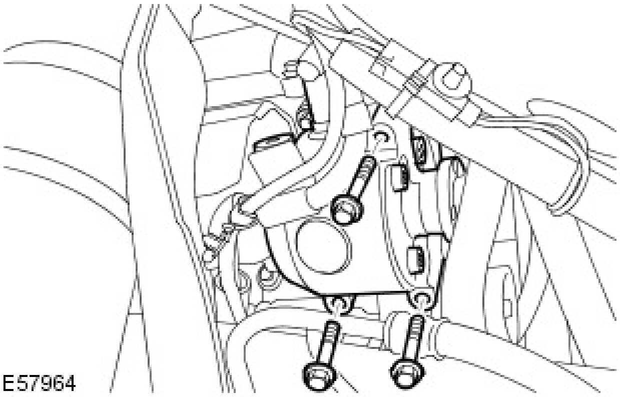
18. Install the transmission cooler pipes.

- Clean the component mating faces.
- Install new O-ring seals.
- Install the clamp.
- Tighten the bolt to 25 Nm (18 lb.ft).



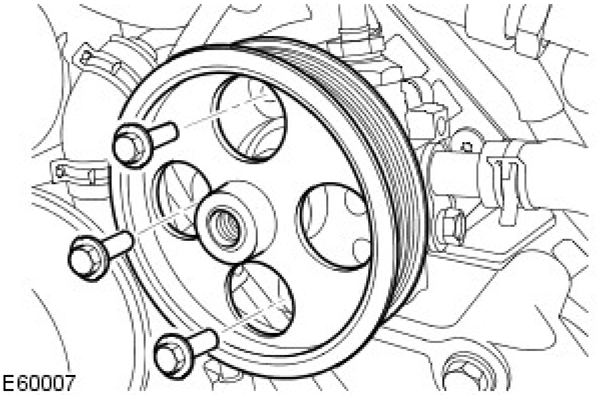
19. Install the generator and dynamic response pump mounting brackets.

- Install the 4 bolts.
- Tighten to 45 Nm (33 lb.ft).



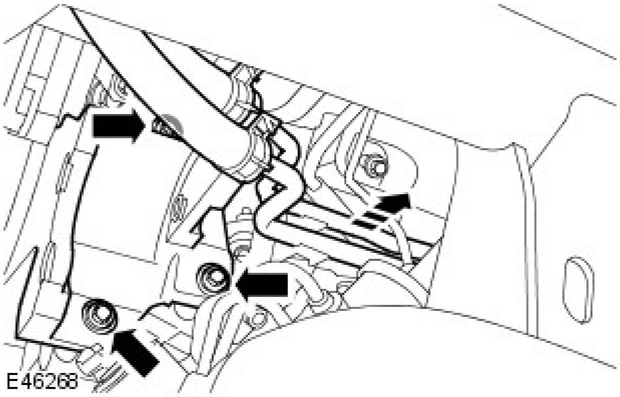
20. Install the dynamic response pump.

- Install the 3 bolts.
- Tighten the bolts to 22 Nm (16 lb.ft).



21. Install the power steering pump.

- Tighten the bolts to 25 Nm (18 lb.ft).



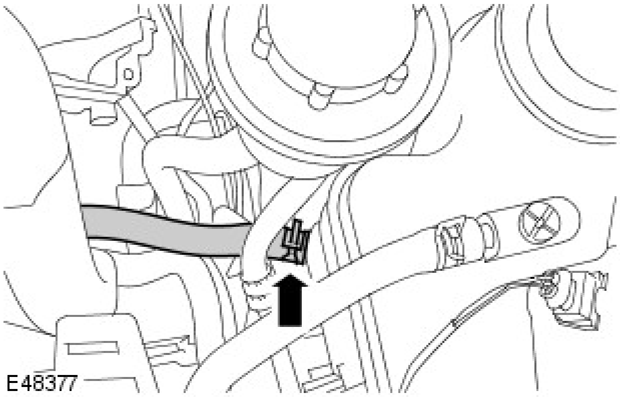
22. Install the A/C compressor assembly.

- Install the A/C mounting bracket.
- Tighten the bolts to 25 Nm (18 lb.ft).
- Connect and secure the electrical connector.

23. Install the generator.
For additional information, refer to: Generator (414-02B Generator and Regulator - V8 4.4L Petrol, Removal and Installation).

24. Connect the coolant expansion tank lower hose.

- Secure the clip.

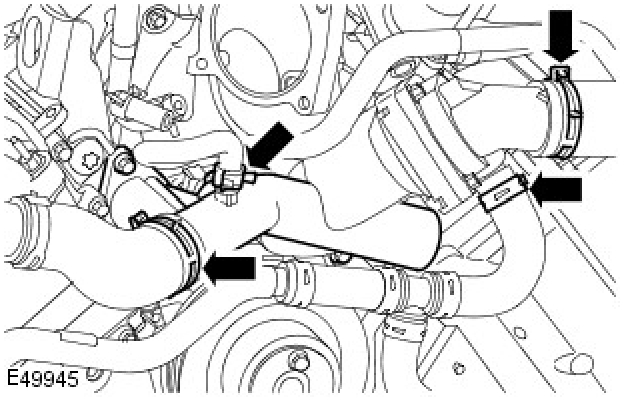


25. Connect the thermostat housing coolant hoses.

- Secure the 2 clips.

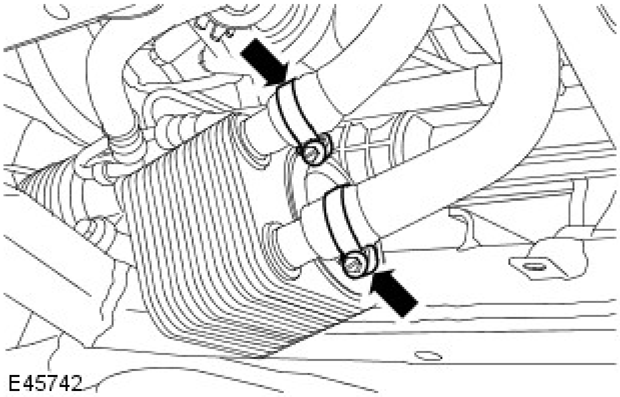
26. Connect the upper coolant hose assembly.

- Secure the 2 clips.



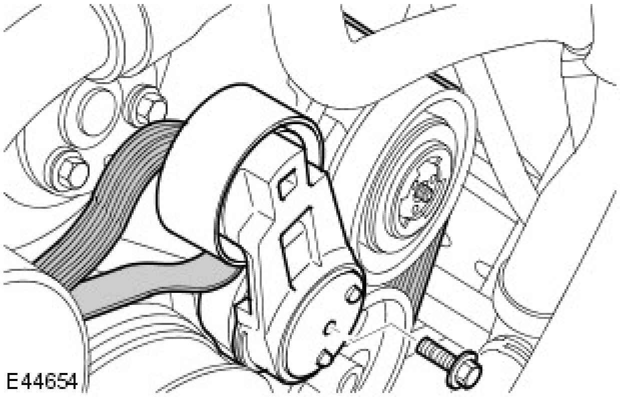
27. Connect the engine oil cooler coolant hoses.

- Install the hose assembly.
- Secure the 2 clips.



28. Install the exhaust system.
For additional information, refer to: Exhaust System (309-00B Exhaust System - V8 4.4L Petrol, Removal and Installation).

29. Install the fender splash shields.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

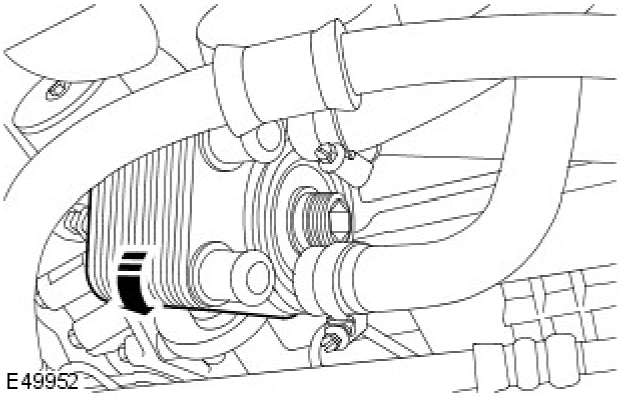


30. Install the accessory drive belt tensioner.

- Tighten the bolt to 45 Nm (33 lb.ft).

31. Install the accessory drive belt.
For additional information, refer to: Accessory Drive Belt (303-05B Accessory Drive - V8 4.4L Petrol, Removal and Installation).

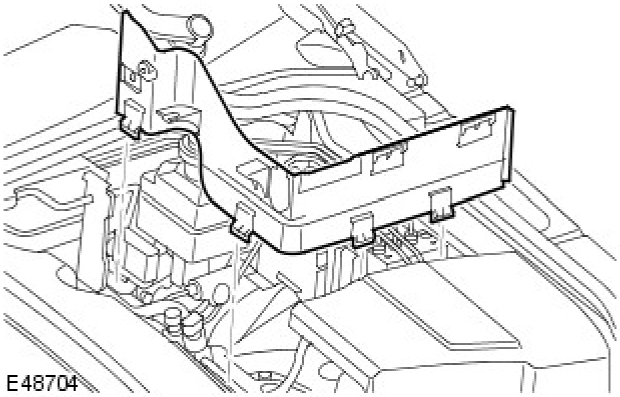
32. Install the RH air cleaner assembly.
For additional information, refer to: Air Cleaner (303-12B Intake Air Distribution and Filtering - V8 4.4L Petrol, Removal and Installation).



33. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

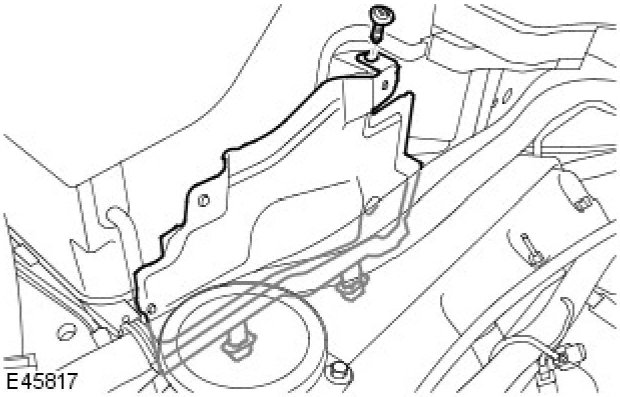
Align the engine oil cooler to the fitted position.

- Tighten the Allen bolt to 60 Nm (44 lb.ft).



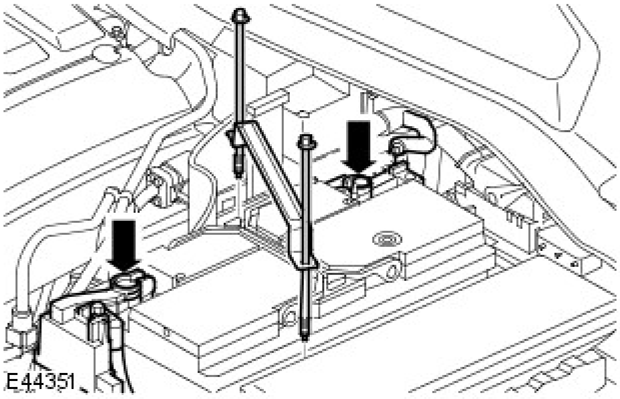
34. Install the auxiliary battery compartment side wall.

- Install the battery positive cable and grommet.
- Secure the 4 clips.



35. Install the engine compartment upper heat shield.

- Install the 2 screws.
- Secure in the 2 clips.



36. Install the battery.

37. Install the battery clamp.

- Install the 2 bolts.

38. Install the battery positive cable.

39. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

40. Install the battery cover.

- Release the 2 mounting clips.
- Secure with the 2 clips.

41. Fill the engine with oil.
For additional information, refer to: Engine Oil Draining and Filling (303-01A Engine - V8 S/C 4.2L Petrol, General Procedures).

42. Fill the cooling system.
For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03B Engine Cooling - V8 4.4L Petrol, General Procedures).

43. Check and top-up the transmission fluid level.
For additional information, refer to: Transmission Fluid Level Check (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, General Procedures).

44. Install the engine cover.
For additional information, refer to: Engine Cover - V8 4.4L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).

45. Return the hood from the service position.

- Release the 2 clips.
- Connect the struts and secure with the clips.

46. Using the approved diagnostic equipment, clear the powertrain control module (PCM) adaptions.

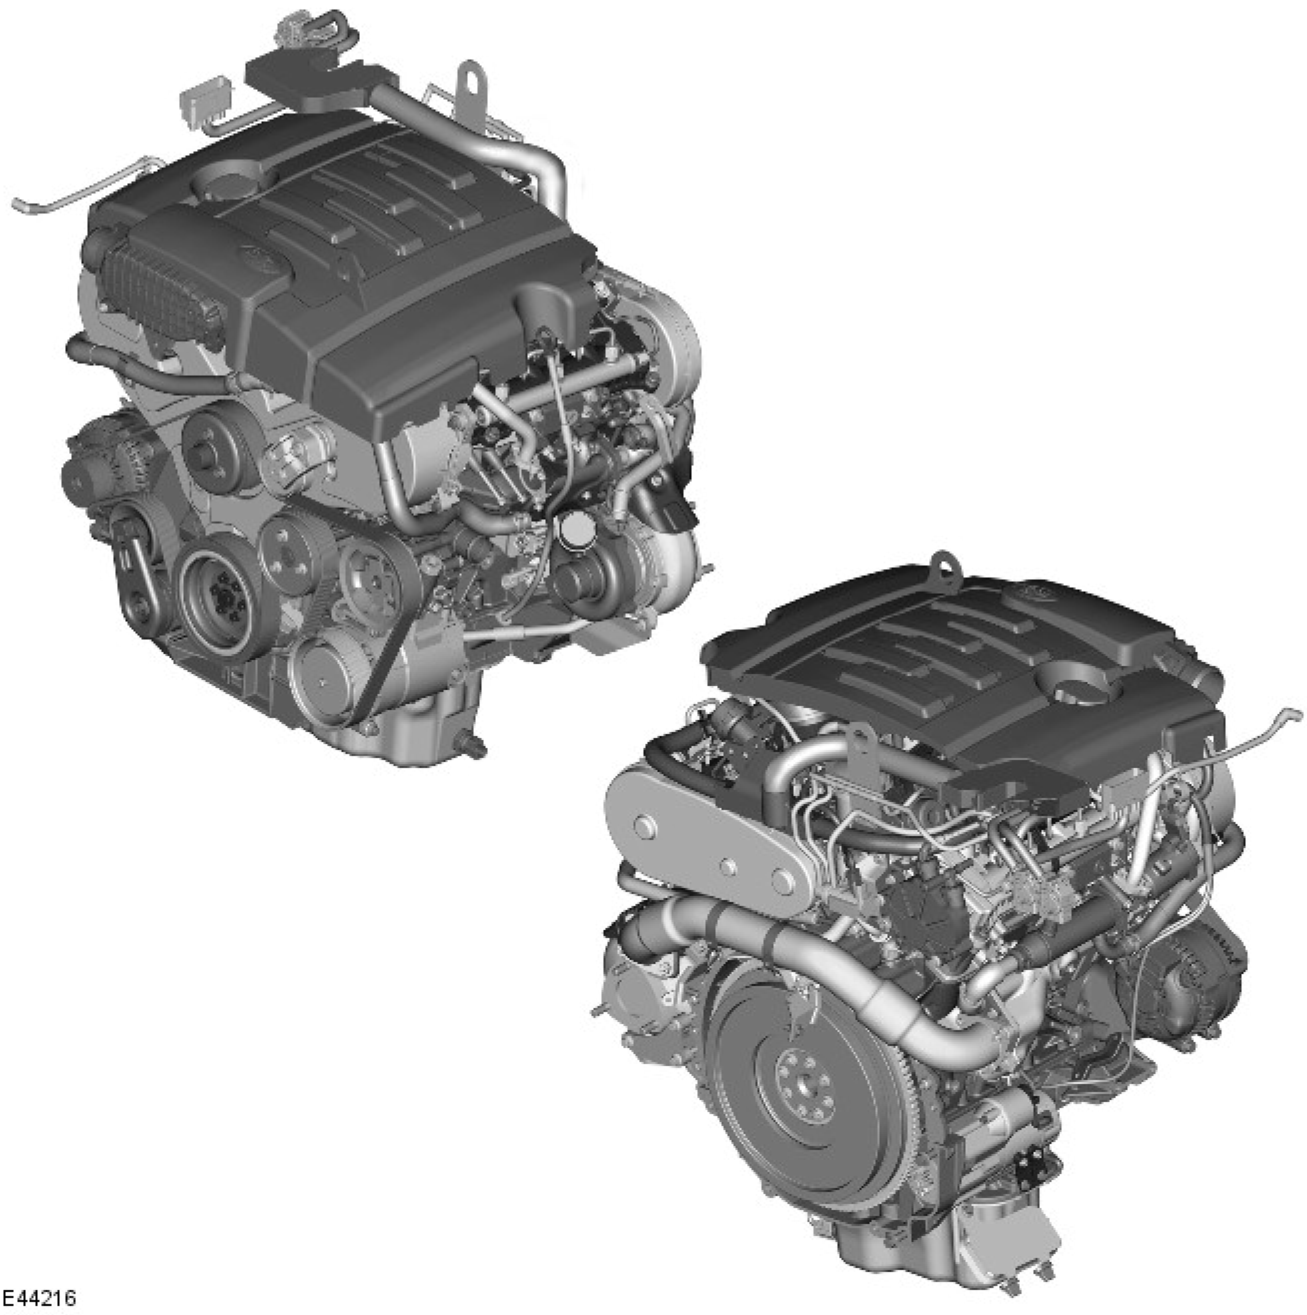
Engine - TDV6 2.7L Diesel - Engine

Description and Operation

External View



GENERAL

The TdV6 engine is a 2.7 liter, direct injection, six-cylinder diesel engine having two banks of three cylinders, arranged at 60 degrees to each other. There are 4 valves per cylinder, which are operated by two overhead camshafts per cylinder bank. The engine emissions comply with ECD3 (European Commission Directive) legislative requirements and employs two catalytic converters, electronic engine management control, positive crankcase ventilation and exhaust gas recirculation to limit the emission of pollutants. The unit is water cooled and turbo-charged. The fuel injection system features common rail technology.

The cylinder block is manufactured in Compacted Graphite Iron (CGI) and is coupled with a separate aluminium ladder frame to provide a lightweight, compact and very stiff bottom end of the engine. The cylinder heads are cast aluminium with a moulded plastic camshaft cover. The single-piece oil sump is formed from stamped steel. The cast iron exhaust manifolds are unique for each cylinder bank and a moulded plastic acoustic cover is fitted over the upper engine to reduce engine-generated noise.

TECHNICAL FEATURES

The technical features include:

- 60 degree 'vee' 6 cylinder engine with a CGI cylinder block
- Plastic cylinder head cover
- Two light, high strength, aluminium cylinder heads
- 4-valve technology with centrally arranged fuel injectors
- Steel roller rockers with hydraulic lash adjusters
- Twin plenum intake system integrated with the camshaft cover
- Variable Geometry Turbocharger
- Common rail direct fuel injection system
- High pressure fuel pump
- Gallery cooled pistons with a central crown bowl
- Two electronically controlled Exhaust Gas Recirculation (EGR) valves
- Two EGR coolers
- Exhaust re-treatment by means of a diesel specific oxidation catalytic converter and primary catalytic converter
- Cooling fan with electro-viscous clutch drive.

ENGINE DATA

The technical data is detailed below:

DESCRIPTION	TYPE
Configuration	60 degree V6
Maximum power	147 kW at 4000 rpm
Maximum torque	440 Nm at 1900 rpm

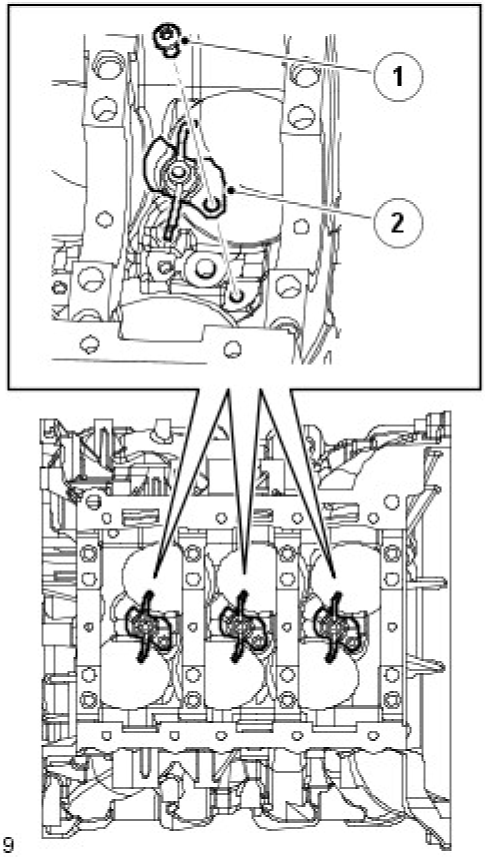
Cylinder Block

The cylinders and crankcase are contained in the cylinder block, which is of single cast CGI construction with a hollow beam structure. With this type of construction less material is required than for a conventional cast iron block, therefore, reducing engine weight and length.

Piston Cooling Jets



E44219

Item	Part Number	Description
1	-	Bolt
2	-	Piston cooling jet

Jets located in the cylinder block provide piston and gudgeon pin lubrication and cooling. These jets spray oil on to the inside of the piston, the oil then flows through two internal wave shaped channels to help cool each piston crown.

Lubrication oil is distributed through the cylinder block, via the main oil gallery and channels bored in the block, to all critical moving parts. These channels divert oil to the main and big-end bearings via holes machined into the crankshaft.

A tapping at the rear RH side of the cylinder block, below the RH cylinder head, connects a pipe to the turbocharger by means of a banjo connection. Oil is supplied, under pressure via this tapping, from the oil pump to provide lubrication for the turbocharger bearings.

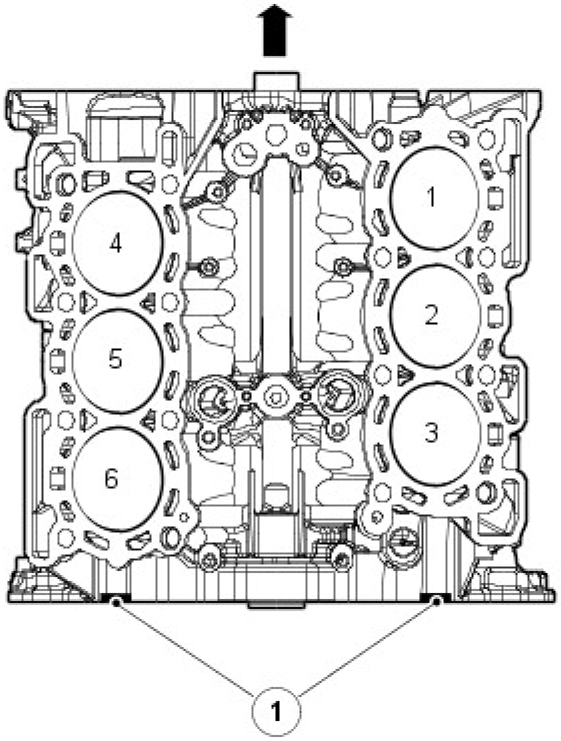
Cylinder cooling is achieved by coolant circulating through chambers in the cylinder block casting.

Two hollow metal dowels are used to locate the cylinder heads to the cylinder block, one on each side at the rear of the unit.

A port is included at the rear LH side of the ladder frame, below the turbocharger, to connect the turbocharger oil return pipe to the sump.

A plug sealing the lubrication cross-drilling gallery is located at the front RH side of the cylinder block. Plugs for the main lubrication gallery are included at the front and rear of the cylinder block.

Engine Data Locations

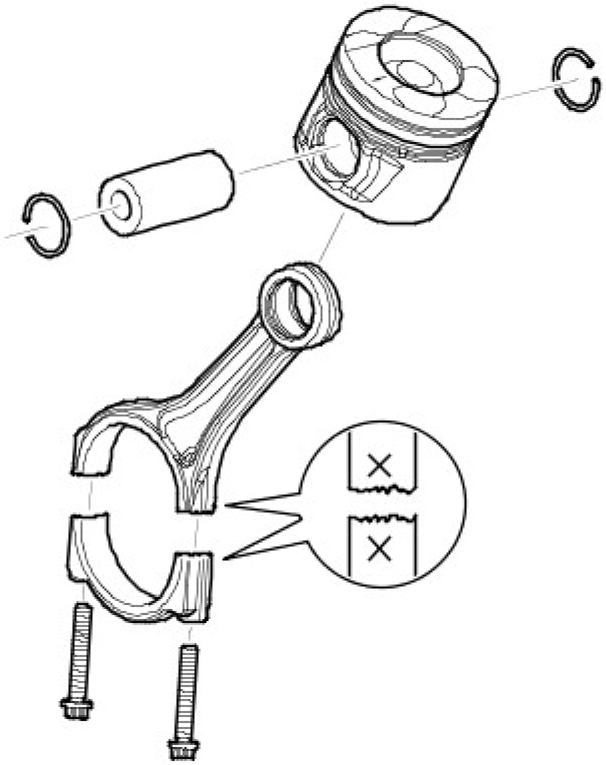


E44217

Item	Part Number	Description
1	-	Engine data locations

Engine data is marked at two locations at the back of the cylinder block. Component diameters are represented by alphabetical and numerical codes; keys to the codes are in the Service Repair Procedures (SRP) Manual.

Connecting Rods and Pistons

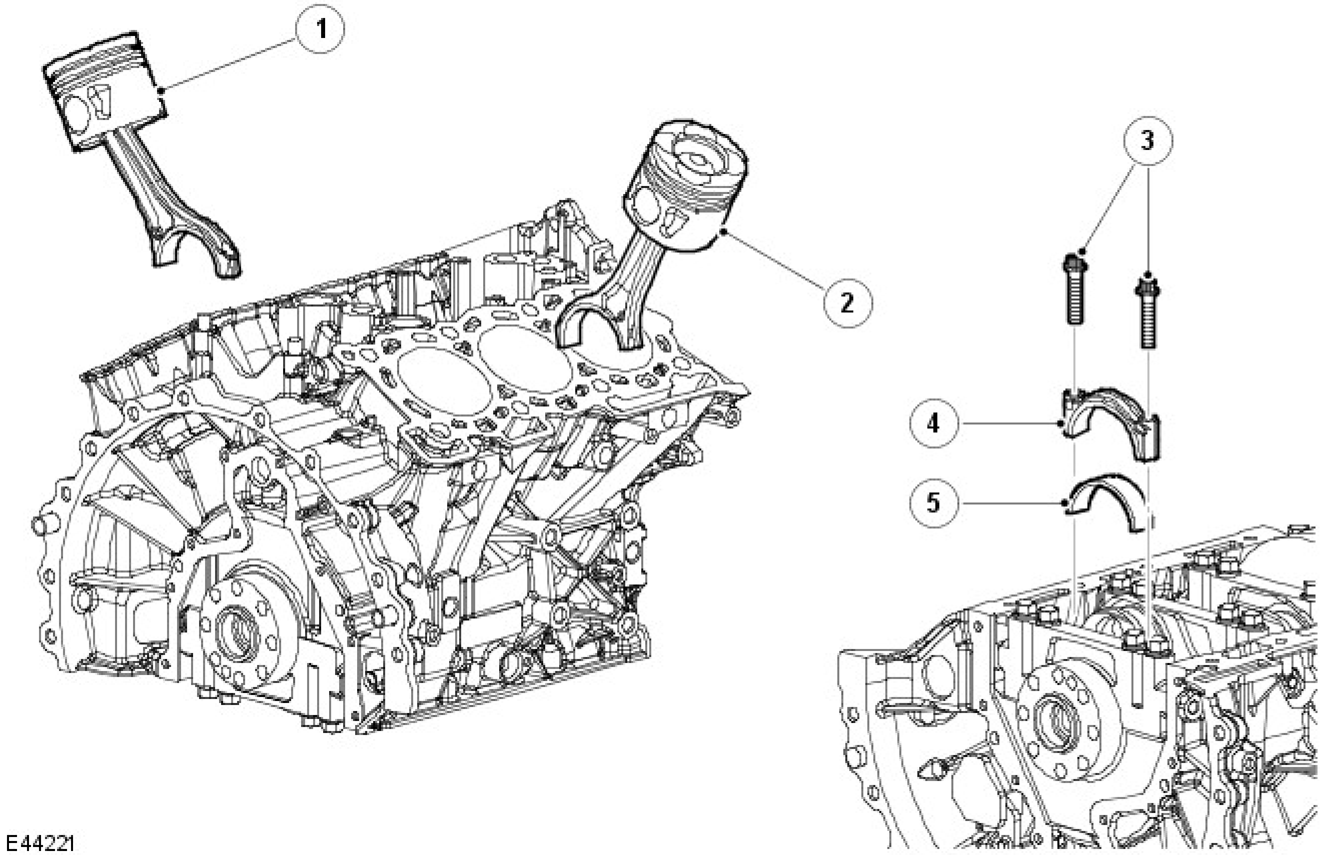


E44220

The connecting rods are manufactured from sinter-forged steel and have fracture-split bearing caps. The bearing caps are produced by fracturing the opposing sides of the connecting rod at the bearing horizontal centre-line. As well as being easier to manufacture, when reassembled the fractured surfaces interlock to form a strong seamless joint. The cylinder position is etched on adjoining sides of the joint to identify matching connecting rods and bearing caps. The selective connecting rod bearings are aluminium/tin split plain bearings. The connecting rod bearing is 'sputter coated', which is a manufacturing process that layers the bearing material to produce a higher load capacity for improved durability.

- NOTE: The connecting rods are not selective.

Connecting Rod Installation



Item	Part Number	Description

2	-	Piston and connecting rod assembly, cylinders 1-3
3	-	Bolts
4	-	Connecting rod bearing cap
5	-	Connecting rod lower bearing

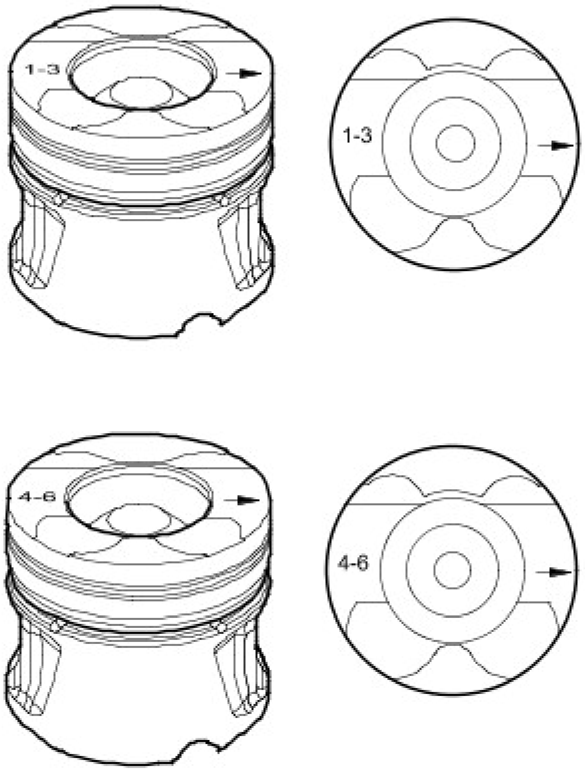
When installing a connecting rod, ensure the back of the connecting rod faces the centre of the 'vee'.

The pistons are made from aluminium alloy and are fitted with three rings. The piston crown incorporates a pronounced bowl; this forms the combustion chamber, which promotes swirl and turbulence necessary for good combustion and improved emissions. In addition, the piston skirt has a molybdenum-coated surface, which counteracts scoring of the cylinder bore and piston.

The piston also incorporates a double wave gallery within the piston crown to enhance piston cooling. The pistons are supplied oil by means of spray jets located in the cylinder block oil gallery. These jets ensure optimum piston cooling to counteract the high temperatures generated by the combustion process.

Each piston is installed on a wrist pin located in a aluminium/tin bushing in the connecting rod.

Piston Installation



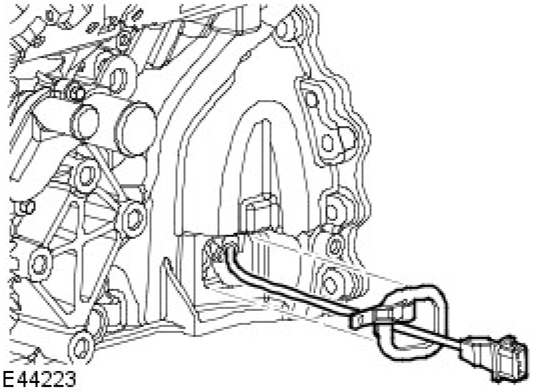
E44222

When installing pistons ensure the arrows on the piston crowns all point to the front of the engine and the pistons are located in the correct cylinder banks, i.e. cylinders 1, 2, 3 or cylinders 4, 5, 6.

- NOTE: All pistons are common single grade/single part number for all engines.

The piston top ring is a taper type and is fitted with the taper to the top of the piston. All rings marked 'top' are assembled with 'top' uppermost. All rings must be spaced evenly around the piston before installing. The circumference gap of the double bevelled oil control ring must be opposite the spiral control joint.

Crankshaft Position Sensor



E44223

The Crankshaft Position (CKP) sensor is located at the rear of the crankshaft, behind the flywheel in the LH side of the rear oil seal retainer. The sensor provides an input of engine crankshaft speed and position. The sensor works on the principle of the Hall effect and scans a trigger wheel (magnetic disc) on the crankshaft. An air gap of 0.4 to 1.5mm, between the trigger wheel and the CKP sensor, is achieved by the positional mounting of the sensor.
For additional information, refer to: Electronic Engine Controls (303-14C Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

Starter Motor

The engine starter motor is installed at the rear RH side of the ladder frame, at the cylinder block to ladder frame split line.

For additional information, refer to: Starting System (303-06C Starting System - TDV6 2.7L Diesel, Description and Operation).

Coolant Drain Plug

Two coolant drain plugs are installed in the cylinder block, one is fitted in the rear RH side, and the other is fitted in the middle of the cylinder block on the LH side.

Cylinder Block Heater

On vehicles destined for cold climates, a cylinder block heater replaces a core plug in the middle of the cylinder block on the LH side.

2	-	Water pump
3	-	'O' ring seal

The coolant pump is installed on the LH side of the cylinder block front face and is secured and sealed via three bolts and an 'O' ring. The coolant pump is driven by a poly-vee belt via the crankshaft.

Crankshaft

The crankshaft is forged steel and fillet rolled with induction hardened journals, which run in four bearings with clamped two layer bearing shells.

The main bearing caps are double and cross-bolted, this adds to the strength and rigidity of the engine block.

The crankshaft drive pulley is not keyed onto the crankshaft; it is secured to the crankshaft by a single bolt.

- NOTE: Under no circumstances must the crankshaft pulley be tightened or loosened with the timing belt fitted.

- NOTE: Do not attempt to remove the crankshaft drive pulley unless you have the correct special crankshaft-locking tool.

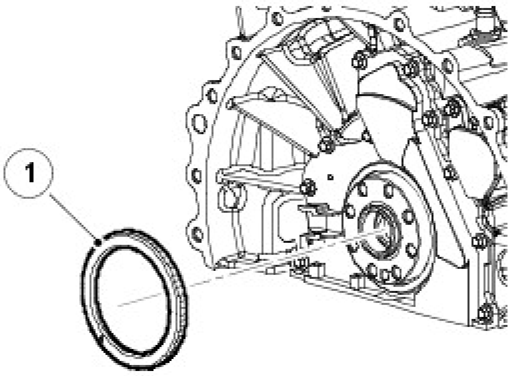
The crankshaft rear oil seal is a press fit in the rear oil seal retainer. The rear oil seal retainer also houses the CKP sensor.



E44228

Item	Part Number	Description
1	-	CKP sensor trigger wheel

The trigger wheel is located on the rear of the crankshaft. It is pressed onto the crankshaft using a special tool, which also precisely aligns the trigger wheel for crankshaft position and timing. The trigger wheel consists of 60 magnets, minus 2 for ECM crankshaft position reference and synchronisation. The magnets cannot be seen on the trigger-wheel; therefore, it can only be positioned using the special tool.

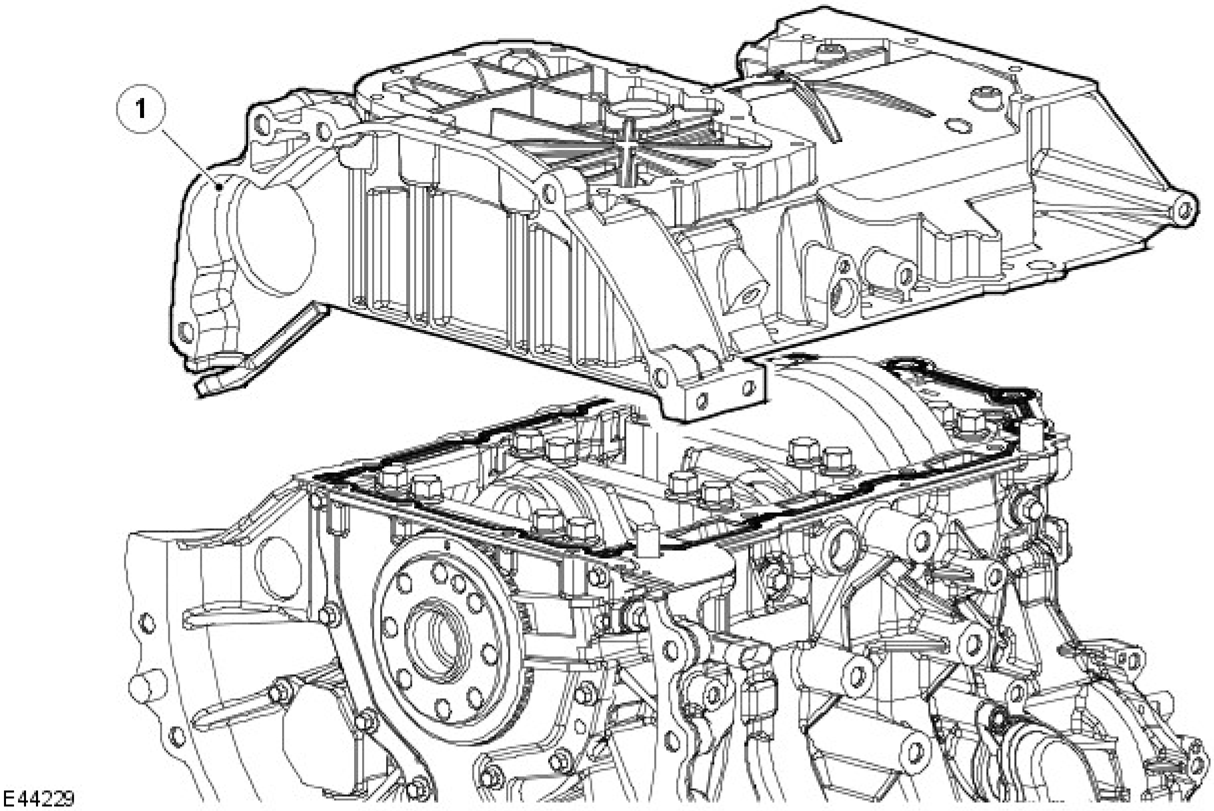
The CKP sensor air gap is 0.4mm to 0.5mm with no adjustment available. The sensor bolts into the rear oil seal retainer and the tolerance on the retainer and sensor give an air gap within the specified range.

- NOTE: If the trigger wheel is removed for any reason, a new trigger wheel must be fitted. Do not reuse the old trigger wheel.

Main Bearings

The main bearings are aluminium/tin split plain selective bearings. An oil groove in the top half of each bearing transfers oil into the crankshaft for lubrication of the connecting rod bearings. The upper and lower shells of bearing number four contain integral thrust washers, which limits the end float of the crankshaft.

Ladder Frame



Item	Part Number	Description
1	-	Ladder frame

The ladder frame is fitted to the lower cylinder block to stiffen the base structure of the engine thus helping to reduce Noise, Vibration and Harshness (NVH). The frame is made of high-pressure die cast aluminium and also incorporates an oil baffle plate to reduce oil foaming and splash.

The ladder frame is secured to the cylinder block with 2 dowels, 2 locator pins for the gasket and 18 retaining bolts; three different lengths of bolts are used:

- M6 x 20, 6 of
- M8 x 75, 4 of
- M6 x 105, 8 of

Iron inserts, cast into the main bearing supports of the ladder frame, minimise main bearing clearance changes due to heat expansion.

A gasket seals the joint between the ladder frame and the cylinder block.

A port for the oil level gage tube is included in the casting on the LH side of the ladder frame.

An oil pick-up pipe with integral strainer locates in the front of the ladder frame to provide oil to the crankshaft driven oil pump.

Sump

The sump consists of a pressed steel oil pan bolted to the aluminium alloy ladder frame with 14 M6 x 16 bolts. The engine oil drain plug and the oil temperature sensor are located at the rear left corner of the sump.

A reusable gasket seals the joint between the oil pan and the ladder frame; a bead of sealant seals the joint between the sump and the ladder frame.

Oil Temperature Sensor

The engine oil temperature sensor is located at the rear left corner of the sump. The sensor provides the ECM and the instrument cluster with the engine oil temperature status.

The sensor circuit consists of an internal voltage divider circuit which, incorporates a Negative Temperature Coefficient (NTC) thermistor. As the engine oil temperature rises the resistance through the sensor decreases and visa versa. The output from the sensor is the change in voltage, as the thermistor allows more current to pass to ground relative to the temperature of the oil. For additional information, refer to: Electronic Engine Controls (303-14C Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

Rear Oil Seal Retainer

The crankshaft rear oil seal retainer is attached to the rear of the cylinder block by ten bolts and is sealed with a rubber seal. The retainer also houses the crankshaft position sensor.

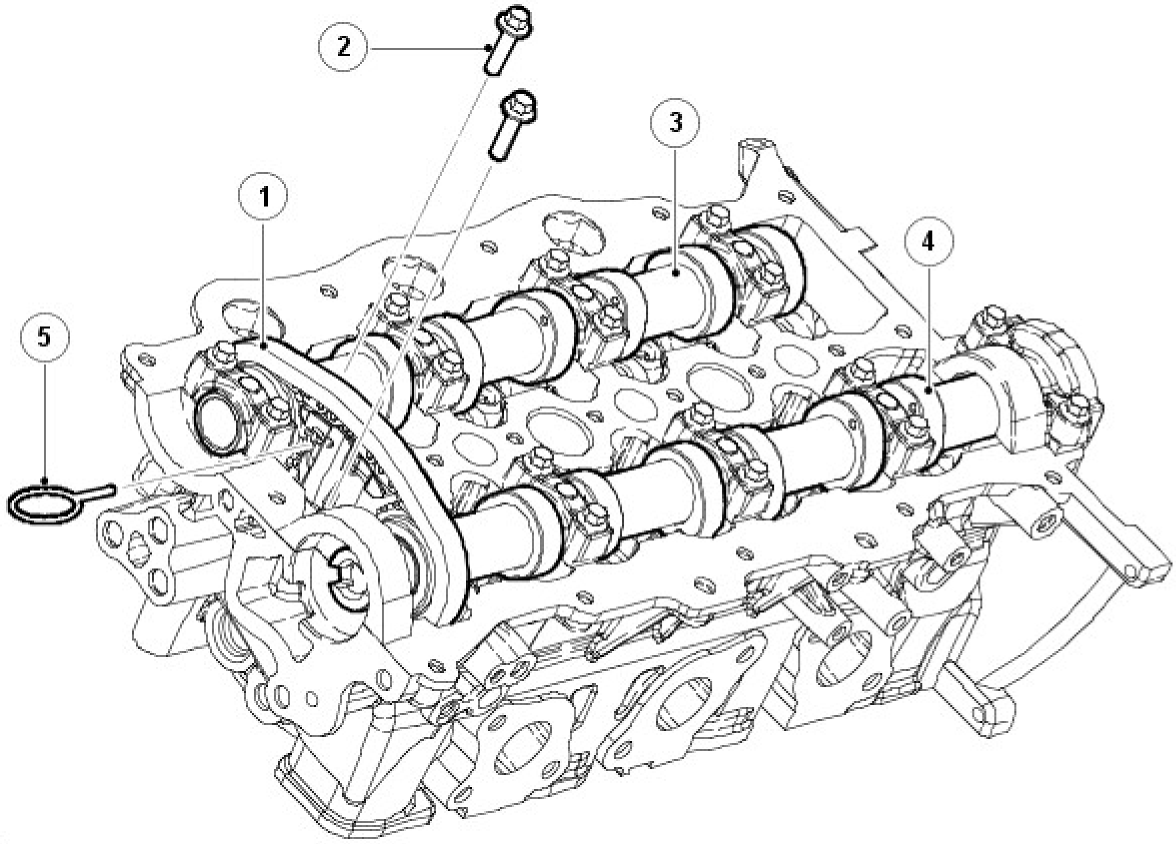
Primary Drive

Primary drive is provided by a single toothed belt from the crankshaft to the exhaust camshaft gears of each cylinder bank via two idler pulleys and a tensioner.

Timing belt adjustment is carried out by an eccentric type tensioner mounted on the RH front face of the cylinder block.

Secondary Drive



E44233

Item	Part Number	Description
1	-	Timing chain
2	-	Bolts
3	-	Inlet camshaft
4	-	Exhaust camshaft
5	-	Tensioner firing pin

Secondary drive is provided by two short crossover chains, which transfer drive from the exhaust camshaft gears to the inlet camshaft gears. The crossover drives are located at the rear of the RH cylinder bank and the front of the LH cylinder bank. This allows for a much shorter and simpler run for the main camshaft drive belt at the front of the engine.

Each crossover chain is tensioned via an automatic chain tensioner, which acts directly on the chains via a guide rail. The tensioners are located between the exhaust and inlet camshafts at the front or rear of the cylinder head, depending on the cylinder bank.

The tensioner firing pin holds the automatic chain tensioner in a compressed state to aid installation.

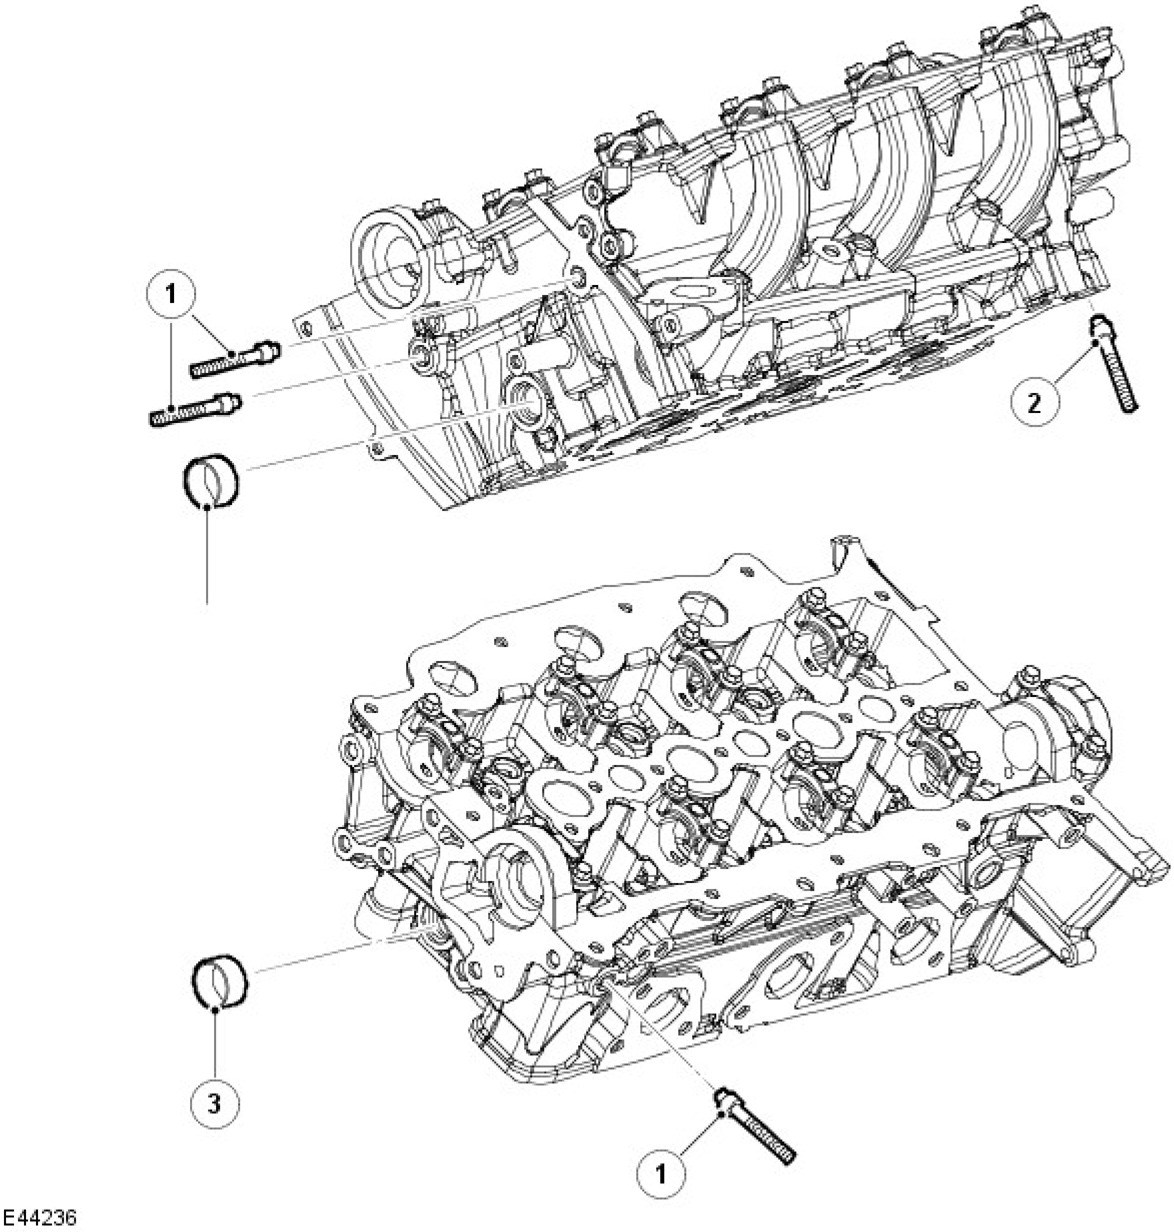
Cylinder Heads



Item	Part Number	Description
1	-	Studs
2	-	Bolts
3	-	Blanking plugs

The aluminium gravity die cast cylinder heads are unique to each cylinder bank. Eight deep-seated bolts help reduce distortion and secure each cylinder head to the cylinder block. The cylinder head bolts are located beneath the camshafts, four under the inlet camshaft and four under the exhaust camshaft. Two hollow dowels align each cylinder head with the cylinder block.

- NOTE: The cylinder head bolts are not accessible with the camshafts fitted.

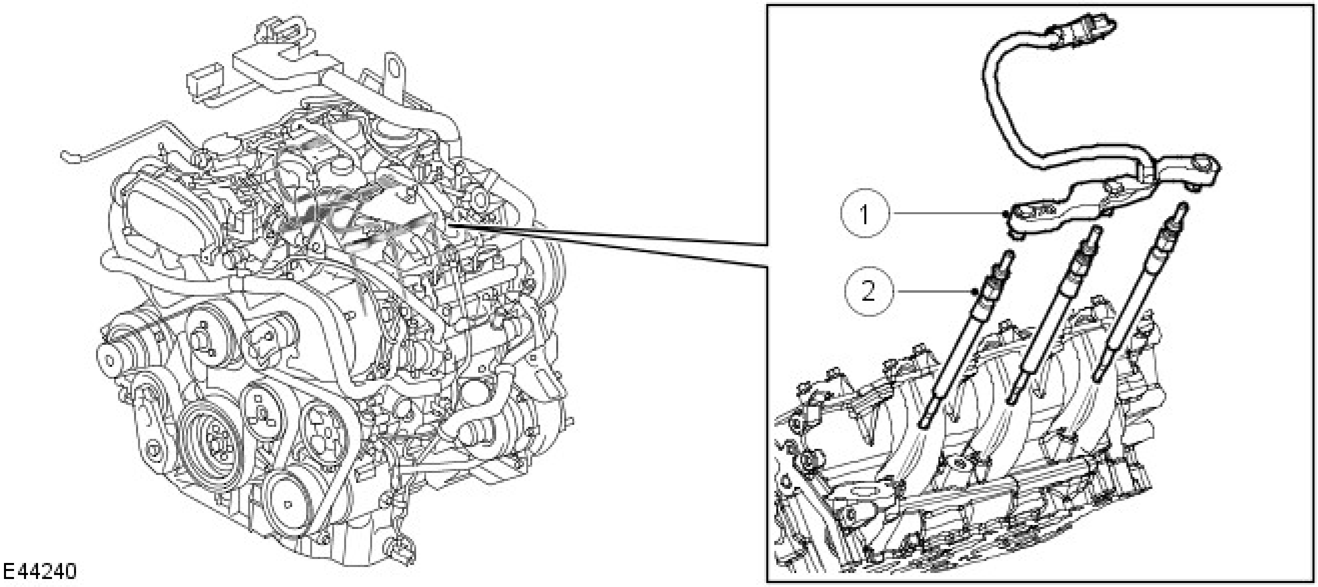
- NOTE: The cylinder head cannot be reworked.

The cylinder head has four ports machined at each cylinder location, two exhaust ports and two inlet ports. One of the inlet ports is helical and functions as a swirl port, the other is arranged laterally as a tangential port and functions as a charge port.

The six fuel injection nozzles are centrally mounted; one above each cylinder and each is fixed to the cylinder head by means of a clamp and two M6 x 35 bolts. For additional information, refer to:

Electronic Engine Controls (303-14C Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation), Fuel Charging and Controls (303-04C Fuel Charging and Controls - TDV6 2.7L Diesel, Description and Operation).

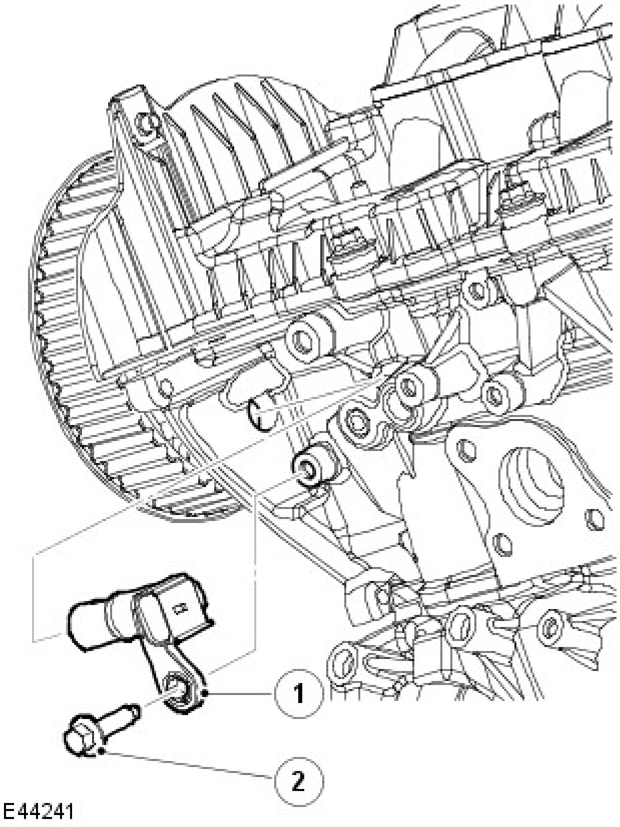
Glowplugs



Item	Part Number	Description
1	-	Harness connector
2	-	Glow plugs

The glow plugs are arranged centrally on the inlet side of the cylinder head, between the two inlet ports of each cylinder. For additional information, refer to: Electronic Engine Controls (303-14C Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

Camshaft Position Sensor

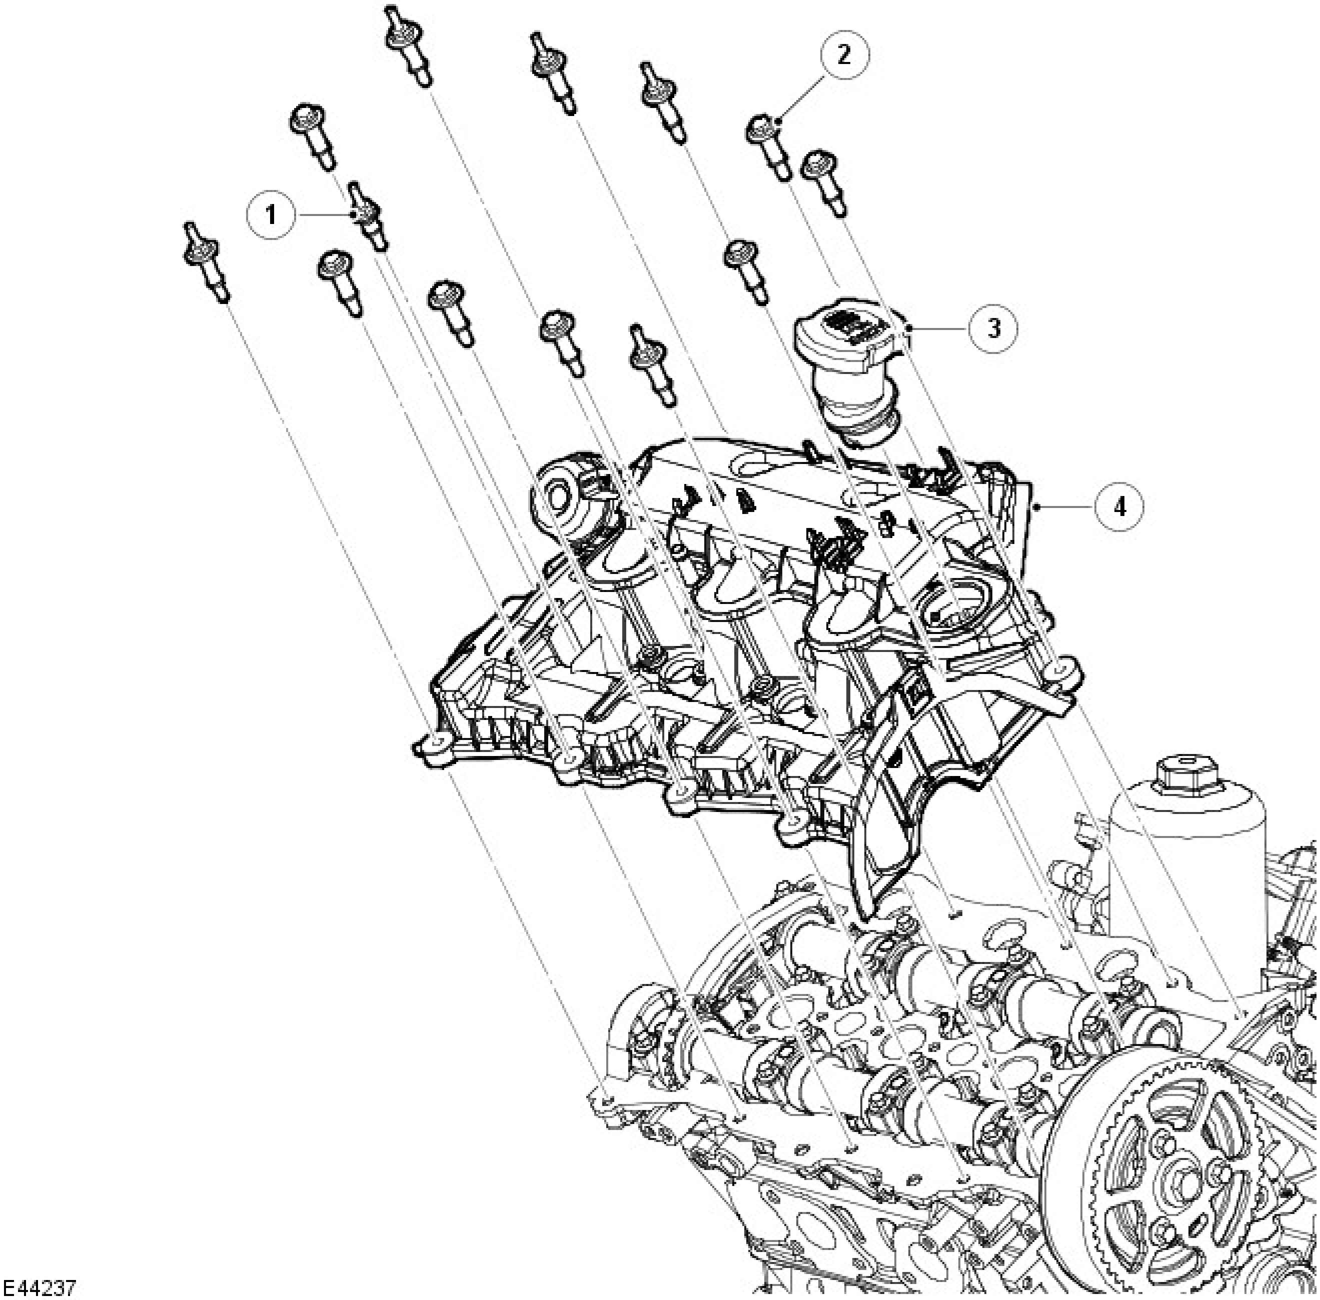


Item	Part Number	Description
1	-	Camshaft Position (CMP) sensor
2	-	Bolt

The CMP sensor locates through a hole in a flange on the front LH side of the LH cylinder head. The exhaust camshaft gear of the LH cylinder head incorporates a trigger wheel, which is used in conjunction with the sensor to measure engine position.
For additional information, refer to: Electronic Engine Controls (303-14C Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

The engine lifting eyes are bolted to the cylinder head, one at the front and two at the rear, one per cylinder head.

Camshaft Covers



Item	Part Number	Description
1	-	Stud bolt M6 x 40, 6 of
2	-	Bolt M6 x 40, 7 of
3	-	Oil filler aperture
4	-	RH camshaft cover assembly

The camshaft covers are manufactured from vinyl ester composite. The RH bank camshaft cover incorporates an outlet for the full load engine breather and the engine oil filler cap. The LH bank camshaft cover incorporates an outlet for the part load engine

breather.
For additional information, refer to: Electronic Engine Controls (303-14C Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

Silicon rubber in-groove gaskets seal the joints between the camshaft covers and the cylinder heads. Together with spacers and seals on the camshaft cover fasteners, they also isolate the covers from direct contact with the cylinder heads, to reduce noise.

Cylinder Head Gasket

The cylinder head gasket is a three-layer, laminated steel type and is available in five different thickness. The choice of gasket thickness is dependent on the maximum piston protrusion. Gasket thickness is identified by serrations cut into the front end of the gasket.

Gasket Selection Table

Piston Protrusion (mm)	Gasket Thickness (mm)	Identification
0.541 - 0.590	1.12	1
0.591 - 0.640	1.17	2
0.641 - 0.690	1.22	3
0.691 - 0.740	1.27	4
0.741 - 0.790	1.32	5

To calculate the correct cylinder head gasket thickness, each piston must be measured at two points, with an average of the two measurements taken to determine the piston protrusion. The highest of the three measurements will determine the gasket required for that particular cylinder head.

• NOTE: The difference between the maximum and minimum protrusion measurement in any one bank should not be greater than 0.1mm. It is permissible to have a different grade of gaskets between the LH and RH banks.

Camshafts

The camshafts are of a hollow steel tube construction, with pressed on sintered lobes. Each camshaft is retained by aluminium alloy caps, five for the exhaust camshafts and four for the inlet camshafts. Location letters, A to I for the intake camshaft and R to Z for the exhaust camshaft, are marked on the outer faces of the caps for each cylinder head.

The LH cylinder bank exhaust camshaft is machined to accept a rear camshaft gear. The rear camshaft gear provides drive for High Pressure (HP) fuel pump, located centrally at the rear of the 'vee', via a short-toothed belt and tensioner pulley.

The RH cylinder head exhaust camshaft is machined at the rear end to provide a drive connection for the vacuum pump.

• NOTE: The camshaft drive sprockets also form the thrust faces for the camshaft endfloat. In production the endfloat is 0.065mm to 0.185mm. In service, if the endfloat is out of specification, the camshaft(s) or cylinder head(s) may have to be replaced.

Camshaft Timing

Valve	Position
Inlet valve opens	8.5° BTDC
Inlet valve closes	35.5° ABDC
Exhaust valve opens	64° BBDC
Exhaust valve closes	12° ATDC

Key:

- BTDC = Before Top Dead Center
- ABDC = After Bottom Dead Center
- BBDC = Before Bottom Dead Center
- ATDC = After Top Dead Center.

Item	Part Number	Description
1	-	Roller rocker
2	-	Hydraulic lash adjuster

The lightweight valve gear provides good economy and noise levels. Valve head diameters are 31mm (1.220 in) for the exhaust and 35mm (1.378 in) for the intake. All valves have 5mm (0.197 in) diameter stems supported in sintered metal seats and guide inserts. Collets, valve collars and spring seats locate single valve springs on both intake and exhaust valves. Valve stem seals are integrated into the spring seats.

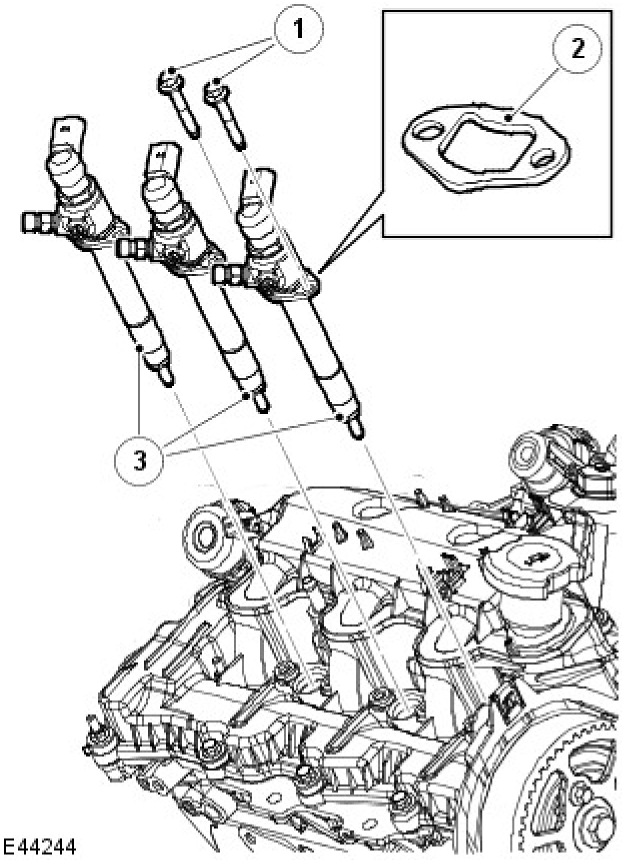
Fuel Injectors



Item	Part Number	Description
1	-	Bolt, 2 per injector
2	-	Clamp
3	-	Injectors

The fuel injectors inject the quantity of fuel required for all the engine operating conditions into the combustion chambers. The quantity of fuel injected during each working cycle is composed of a noise-reducing pilot injection phase and a main injection phase.

The six, side fed, piezo electrically controlled fuel injectors are installed in the fuel rails. The start of fuel injection and the quantity of fuel injected is controlled directly by the ECM. Two O-rings seal each injector to the manifold interface. For additional information, refer to:

Electronic Engine Controls (303-14C Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation),
Fuel Charging and Controls (303-04C Fuel Charging and Controls - TDV6 2.7L Diesel, Description and Operation).

Water Outlet Assembly

1	-	Bolt, 4 of
2	-	Water outlet assembly
3	-	Seals
A	-	Water outlet housing assembly, EGR outlet
B	-	Water outlet housing assembly, radiator outlet
C	-	Water outlet housing assembly, bleed valve

The water outlet assembly connects the cooling channels of the cylinder block to the cooling channels of the LH and RH cylinder heads and provides the coolant outlet for the EGR and coolant return.

LUBRICATION SYSTEM

General

Oil is drawn from the reservoir in the oil pan and pressurised by the oil pump. The output from the oil pump is then filtered and distributed through internal oil passageways.

All moving parts are lubricated by pressure or splash oil. Pressurised oil is also provided for operation of the hydraulic adjusters and the timing gear chain tensioners.

The engine is lubricated by a force-feed oil circulation system with a full flow oil filter. The oil cooler forms a unit with the oil filter and fuel cooler, which is mounted centrally in the middle of the cylinder block between the two banks of cylinders. The engine oil is cooled using the engine cooling system. This eliminates the need for an additional engine oil cooler remotely mounted.

The fuel cooler, which forms part of the oil filter body, is also cooled by engine coolant. In addition there is a further fuel cooler in the return line to the fuel tank.

Oil returns to the oil pan under gravity. Large drain holes through the cylinder heads and cylinder block ensure the quick return of the oil, reducing the volume of oil required and enabling an accurate check of the contents soon after the engine stops.

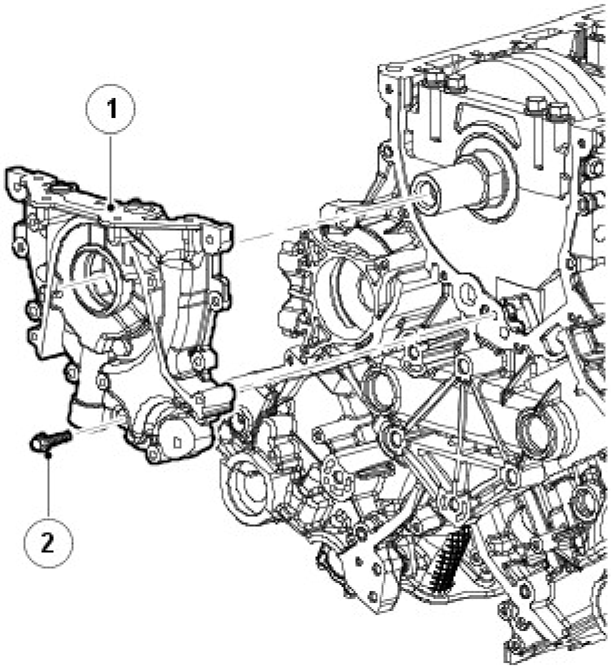
System replenishment is through the oil filler cap on the RH camshaft cover.

With the exception of the pump and level gauge, all oil system components are installed on the sump.

Oil Pick-up

The moulded composite oil pick-up is immersed in the oil reservoir to provide a supply to the oil pump during all normal vehicle attitudes. The castellated inlet allows the supply to be maintained even if the sump pan is deformed (e.g. by 'grounding'). A mesh screen in the inlet prevents debris from entering the oil system.

Oil Pump



E44230

Item	Part Number	Description
1	-	Oil pump
2	-	Bolt

The oil pump is a gear type pump and is bolted and dowelled to the front of the engine block. It is sealed by means of a rubber gasket, which is recessed into the oil pump housing. The pump inlet and outlet ports align with oil passages in the ladder frame.

The pumping element is an eccentric rotor, which is directly driven by flats on the crankshaft. An integral pressure relief valve regulates pump outlet pressure at 4.5 Bar (65.25 Psi).

The front crankshaft oil seal is housed in the oil pump casing and is fitted such that its front face is 1mm underflush with the machined front face of the oil pump.

• NOTE: The seal is not to be pushed all the way into the bore as this will block the seal drains.

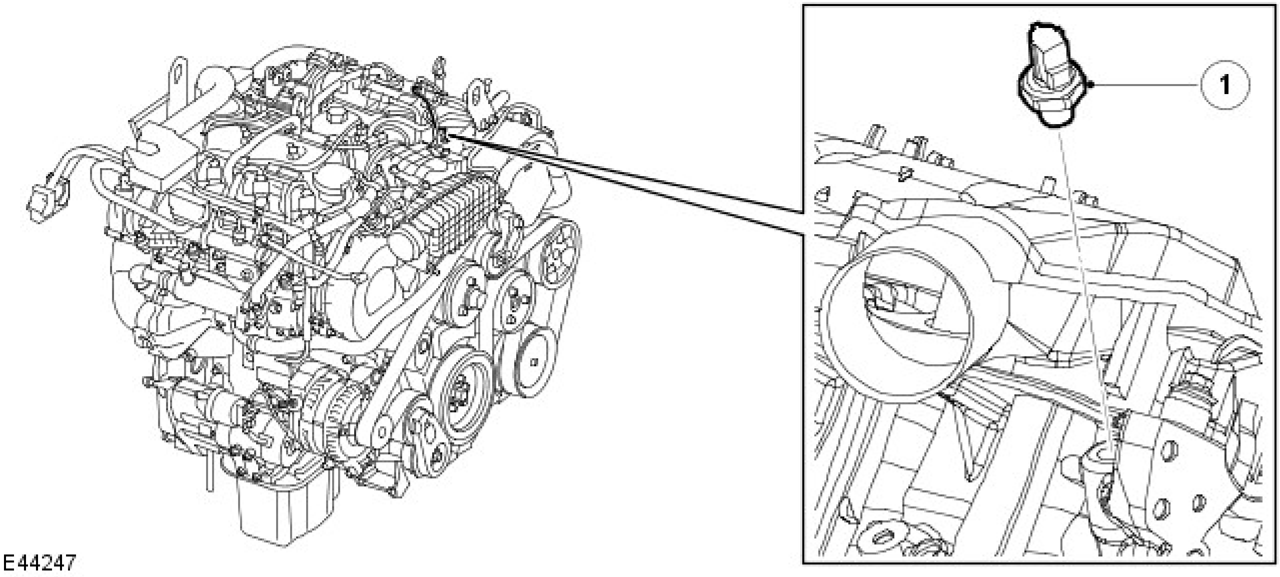
Oil Filter

The oil filter is a replaceable cartridge installed on an adapter in the centre of the 'vee'. An internal bypass facility permits full flow bypass if the filter is blocked.

• NOTE: In service care must be taken when removing the oil filter to minimise oil drips and spillage into the engine 'vee' and cam covers:

- Do not use air/power tools
- Unscrew oil filter cap 4-5 turns
- Leave for a minimum of 1 minute to allow to drain
- Remove cap, ensuring minimal oil spillage
- Replace oil filter element into the cap (can only be fitted in one direction)
- Replace cap and torque to specification.

Oil Pressure Switch



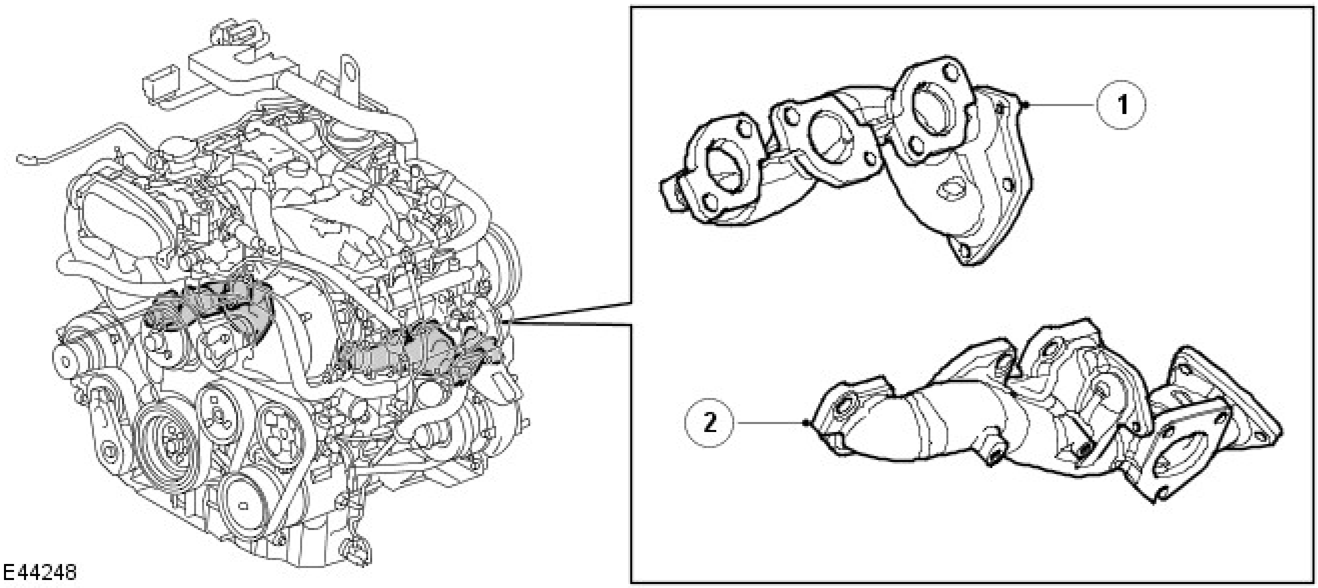
Item	Part Number	Description
1	-	Oil pressure switch

The oil pressure switch, located in the 'vee' at the front of the LH cylinder head, connects a ground input to the instrument cluster when oil pressure is present. The switch operates at a pressure of 0.15 to 0.41 Bar (2.2 to 5.9 Psi).

Oil Level Gage

The oil level gage locates midway along the LH side of the oil pan, supported in a tube installed in the ladder frame. Two holes in the end of the gage indicate the minimum and maximum oil levels. There is a difference of approximately 1 litre (1 US quart) between the two levels.

EXHAUST MANIFOLD



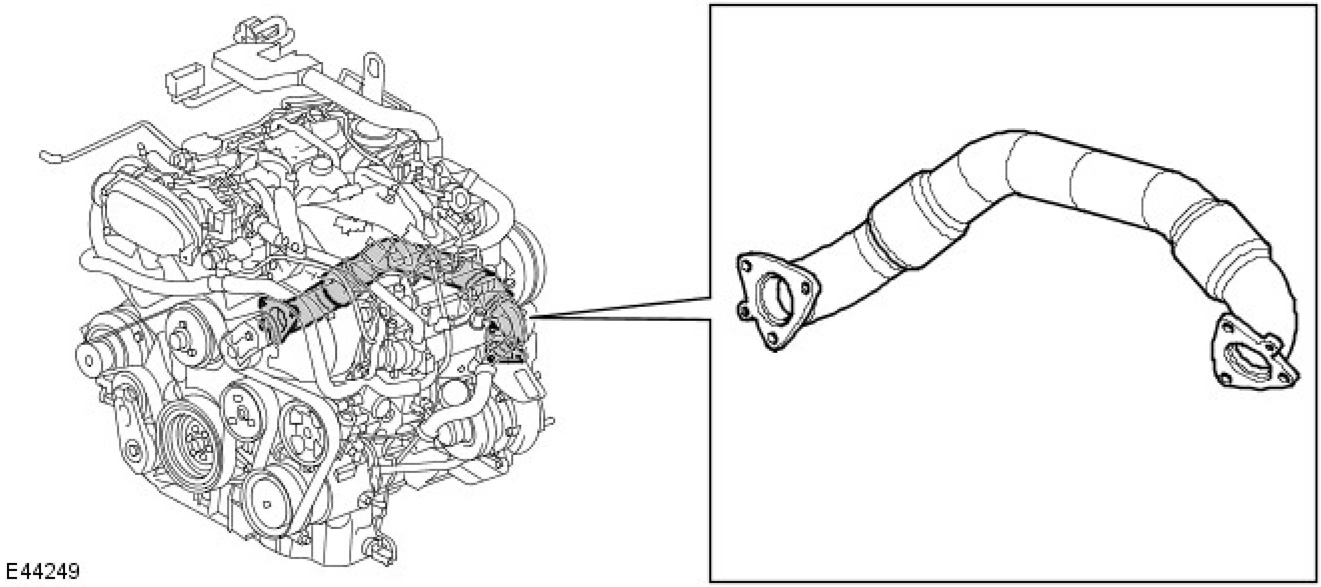
Item	Part Number	Description
1	-	LH exhaust manifold
2	-	RH exhaust manifold

The exhaust manifolds are cast from steel alloy and are unique for each cylinder bank. They are sealed to the cylinder head by means of a steel gasket. Sacrificial plastic sleeves are used to align the manifolds. These sleeves must be changed when refitting the manifolds. Spacers on the securing bolts allow the manifolds to expand and retract with changes of temperature while maintaining the clamping loads.

Each manifold has a connection for the EGR transfer pipe.

The engine is fitted with a Variable Geometry Turbocharger (VGT), which is fixed to the exhaust manifold by a three-hole flange with a steel gasket.

Crossover Pipe



E44249

A crossover pipe carries the exhaust gasses from the RH exhaust manifold to the turbocharger on the LH exhaust manifold. The crossover pipe is located at the rear of the engine and is routed across the top of the transmissions bell housing.

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

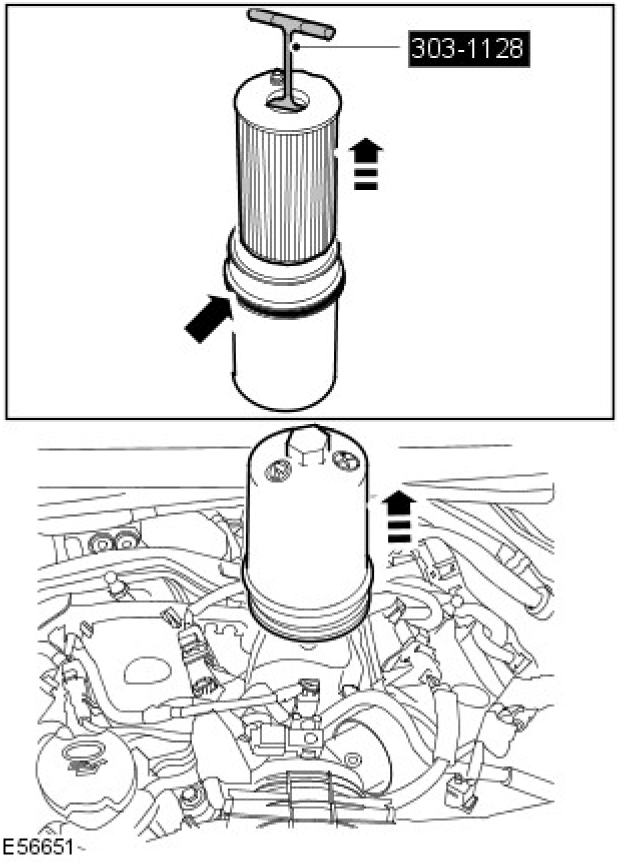
   Raise and support the vehicle.

3. Remove the engine cover.
   For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

4. ⚠ CAUTION: When removing the oil filter assembly, make sure the fuel temperature sensor is not damaged.

   Using the special tool, remove the oil filter element.

   - Loosen the element cover 4 complete turns to allow engine oil to drain from the filter cover.
   - Remove element cover.
   - Remove and discard the O-ring seal.



5. Remove the engine undershield.
   For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

6. Remove the lubricant drain plug.

- Position a container to collect the fluid.
- Discard the oil pan drain plug seal.

7. Install the lubricant drain plug.

- Clean the component mating faces.
- Install a new sealing washer.
- Tighten the drain plug to 25 Nm (18 lb.ft).

8. Install the oil filter element.

- Clean the components.
- Make sure the oil filter element spigot aligns with the hole in the filter housing.
- Install a new O-ring seal.
- Tighten the element cover to 25 Nm (18 lb.ft).

9. Fill the engine with oil.

10. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

11. Install the engine cover.

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the RH exhaust manifold.
For additional information, refer to: Exhaust Manifold RH (303-01C Engine - TDV6 2.7L Diesel, In-vehicle Repair).

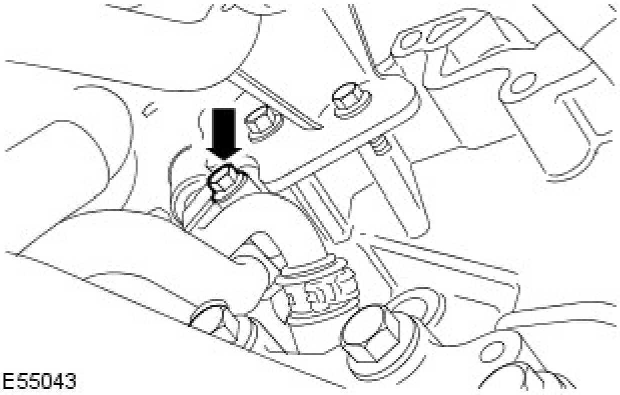
3. Remove the RH camshafts.

4. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

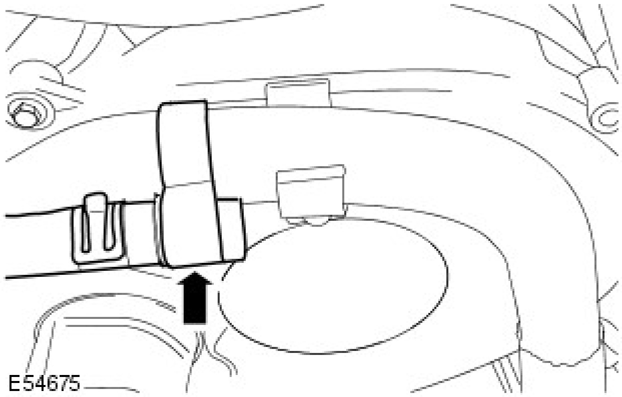
5. Release the engine breather tube.

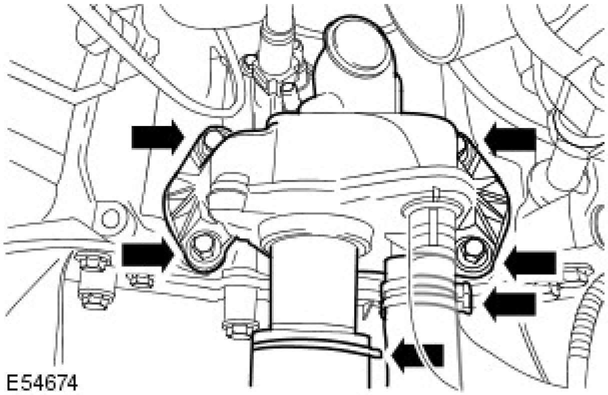
- Remove the retaining bolt.



6. Release the coolant bleed hose.

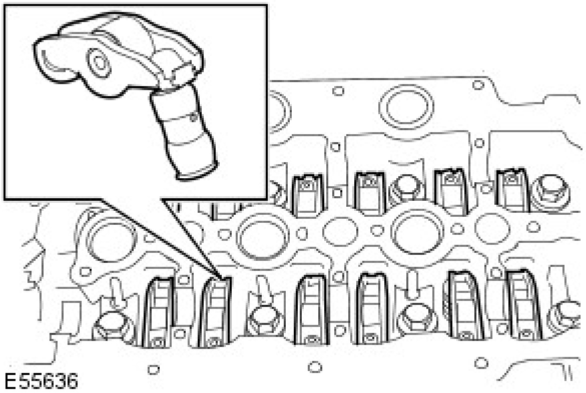
- Release the retaining clip.



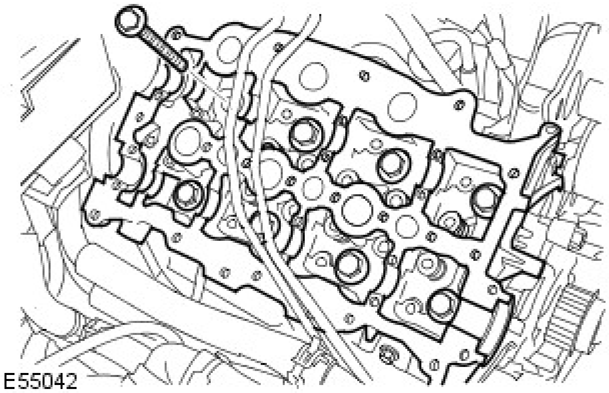


7. Remove the cylinder head coolant elbow.

- Release the two retaining clips and disconnect the hoses.
- Remove the four retaining bolts.
- Remove and discard the O-ring seals.



8. Remove the hydraulic adjuster and rocker assemblies.



9. CAUTIONS:

⚠ The cylinder head must not be placed mating face down. Failure to follow this instruction may result in damage to the vehicle.

⚠ Only use a plastic scraper to clean off the old gasket.

Remove the RH cylinder head assembly.

- Remove and discard the eight cylinder head bolts.
- Remove and discard the cylinder head gasket.

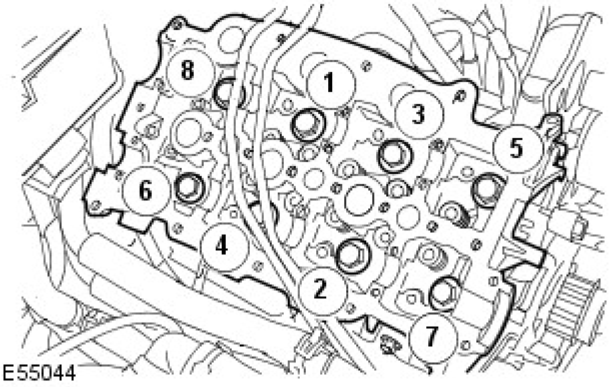
Installation

1. Clean the component mating faces.

2. Check cylinder head face for distortion, across the center and from corner to corner.
For additional information, refer to: Specifications (303-01C Engine - TDV6 2.7L Diesel, Specifications).

3. ⚠ CAUTION: The head gasket must be installed over the cylinder block dowels.

Install a new cylinder head gasket.



4. NOTE: Tighten the retaining bolts in the indicated sequence in four stages.

Install the RH cylinder head assembly

- Install new cylinder head retaining bolts.
- Tighten the bolts evenly in four stages to the sequence shown.
- Stage one: Tighten to 20 Nm (15 lb.ft).
- Stage two: Tighten to 40 Nm (30 lb.ft).
- Stage three: Tighten to 80 Nm (59 lb.ft).
- Stage four: Tighten a further 180 degrees.

5. Install the hydraulic adjuster and rocker assemblies.

6. Install the cylinder head coolant outlet elbow.

- Install new O-ring seals.
- Install the four retaining bolts and tighten to 10 Nm (7 lb.ft).
- Connect the hoses and secure with the clips.

7. Secure the coolant bleed hose.

8. Secure the engine breather tube.

- Tighten the bolt to 10 Nm (7 lb.ft).

9. Install the RH camshafts.

10. Install the RH exhaust manifold.

• WARNINGS:

⚠ Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

⚠ Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠ Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

• CAUTIONS:

⚠ Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

⚠ Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠ Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. 13. ⚠CAUTION: Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

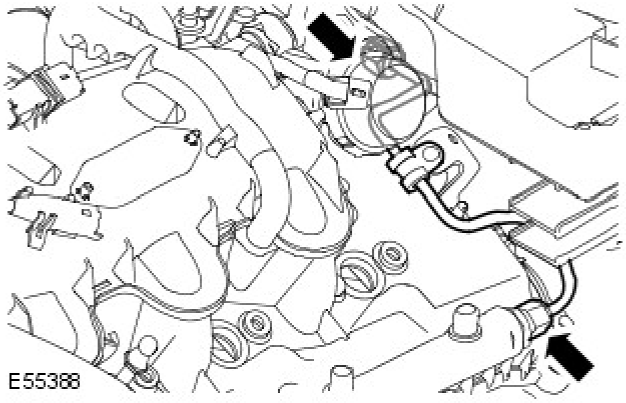
Remove and discard the high-pressure fuel supply line.

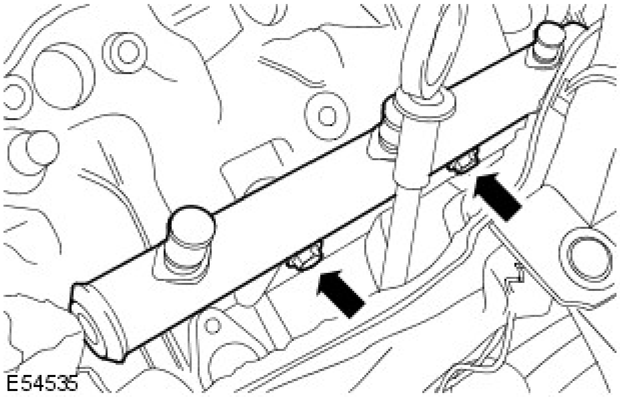
- Install blanking caps to the exposed ports.



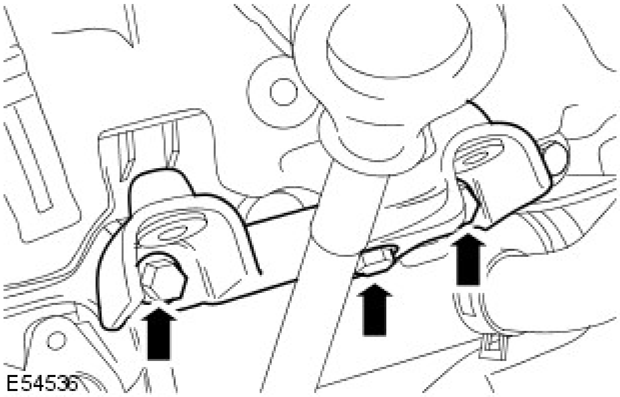
E55388

14. Remove the fuel injection supply manifold.

- Remove the two retaining bolts.

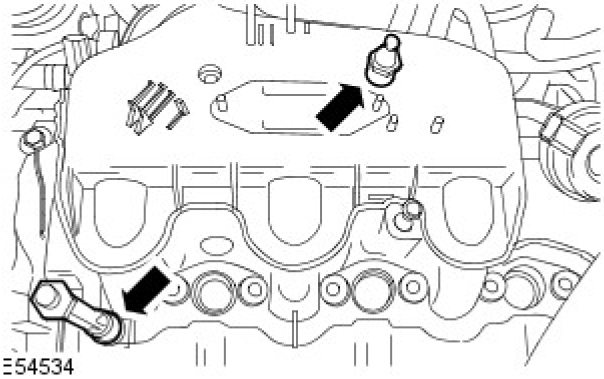


E54535

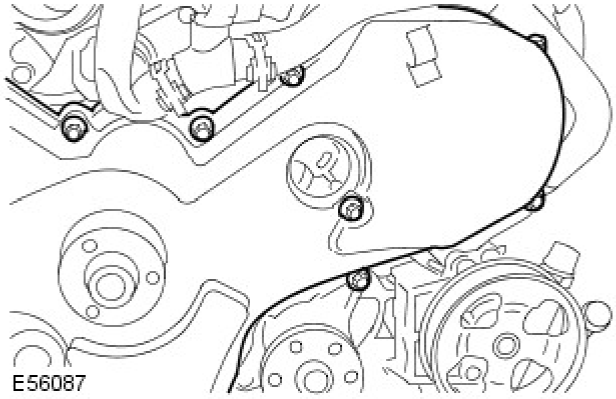


15. Remove the fuel injection supply manifold securing bracket.

- Release the dipstick tube.
- Remove the three retaining bolts.

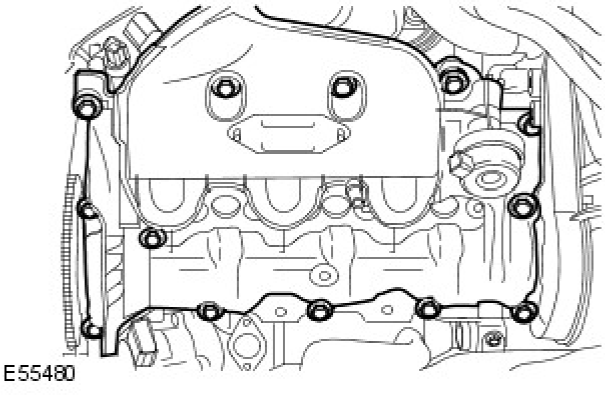


16. Remove the engine cover locating studs.



17. Release the timing belt cover.

- Reposition the timing cover to access the two front valve cover retaining bolts.
- Fully loosen the seven timing belt cover retaining bolts shown.

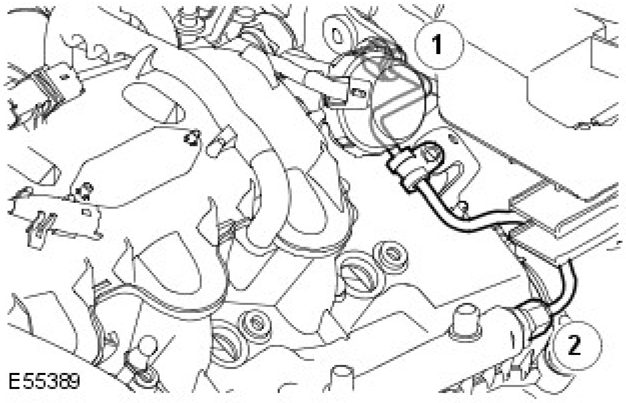


18. Remove the LH valve cover.

- Loosen the 13 valve cover retaining bolts.

Installation

1. Install the LH valve cover.
    - Tighten the 13 retaining bolts to 10 Nm (7 lb.ft).
2. Attach the timing belt cover.
    - Tighten the seven retaining bolts to 10 Nm (7 lb.ft).
3. Install the engine cover locating studs.
4. Install the fuel injection supply manifold securing bracket.
    - Install the two retaining bolts.
    - Tighten the bolts to 23 Nm (17 lb.ft).
    - Secure the dipstick tube.
5. Install the fuel injection supply manifold.
    - Install the two bolts, but do not fully tighten at this stage.



6. Install a new high-pressure fuel supply line.
    - Remove the blanking caps from the ports.
    - Install the new high-pressure fuel supply line, but do not tighten unions at this stage.
    - Tighten the fuel injection supply manifold retaining bolts to 23 Nm (17 lb.ft).
    - Tighten the fuel injection supply line unions in the sequence shown in four stages:
    - Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 15 Nm (11 lb.ft).
    - Stage 2: Tighten the high-pressure fuel supply line union at the fuel injection supply manifold to 15 Nm (11 lb.ft).
    - Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 30 Nm (22 lb.ft).
    - Stage 4: Tighten the high-pressure fuel supply line union at the fuel injection supply manifold to 30 Nm (22 lb.ft).
7. Secure the high-pressure fuel supply line.
    - Tighten the retaining bolt to 10 Nm (7 lb.ft).
8. Install the fuel injector.
   For additional information, refer to: Fuel Injector (303-04C Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).
9. Install the 2 remaining fuel injectors.
10. Connect the valve cover breather hose.
11. Connect the EOP sensor electrical connector.
12. Connect the KS electrical connector.
13. Attach the glow plug harness and KS harness to the valve cover.
14. Install the accessory drive belt idler pulley.
    - Install the retaining bolt and tighten to 47 Nm (35 lb.ft).
15. Install the accessory drive belt.
    For additional information, refer to: Accessory Drive Belt (303-05C Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

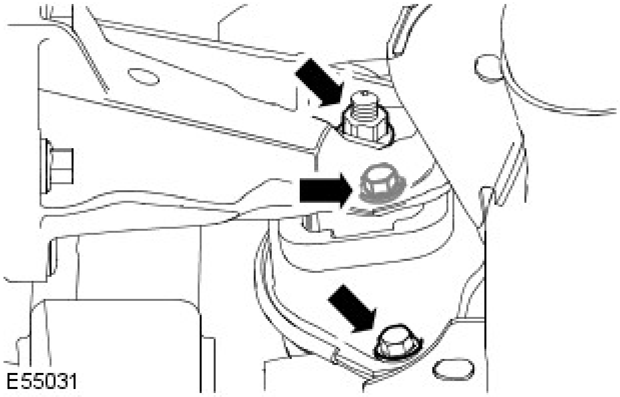
- Raise the engine clear of its LH mount.

5. Remove the engine mount.

- Remove the retaining nut.
- Raise the engine clear of its LH mount.
- Remove and discard the two retaining bolts.



Installation

1. Install the engine mount.

- Clean the component mating faces.
- Install new retaining bolts.
- Tighten the bolts to 45 Nm (33 lb.ft), then a further 60 degrees.

2. ⚠ CAUTION: Protect the engine during this operation.

Lower the engine onto the mount.

3. Install the engine mount retaining nut.

Remove the oil cooler.

- Remove the eight retaining bolts.
- Remove and discard the gasket.
- Remove and discard the O-ring seal.

Installation

1. ⚠ CAUTION: Make sure the gasket is installed correctly.

• NOTE: Make sure all component mating faces are clean.

Install the oil cooler.

- Install a new gasket.
- Install a new O-ring seal.
- Install the eight retaining bolts and tighten to 10 Nm (7 lb.ft).

2. Install the LH KS.

- Install the retaining bolt and tighten to 20 Nm (15 lb.ft).
- Connect the knock sensor electrical connector.
- Attach the KS harness to the valve cover.

3. Install the cylinder head coolant outlet elbow.

- Install new O-ring seals.

- Release the coolant hose retaining clip.

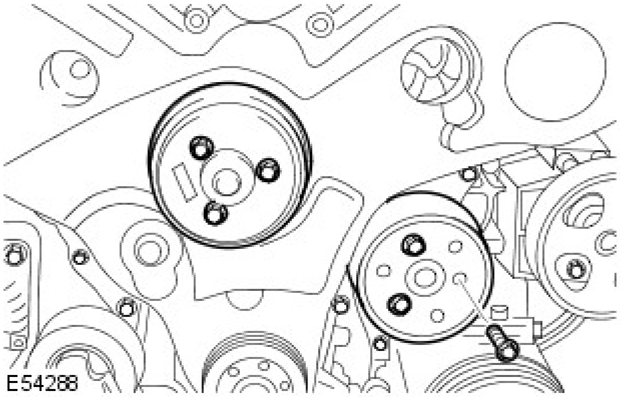
14. Position the EGR coolant hose aside for access.

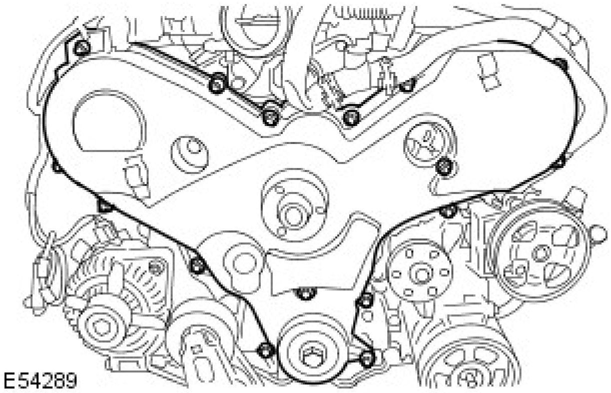
15. Remove the coolant pump and accessory drive belt idler pulleys.

- Remove the six retaining bolts.



16. Remove the timing belt cover.

- Fully loosen the 16 timing belt cover retaining bolts.
- Release the 2 wiring harness clips.



Installation

1. Install the timing belt cover.

- Attach the 2 wiring harness clips.
- Tighten the 16 timing belt cover retaining bolts to 10 Nm (7 lb.ft).

2. Install the coolant pump and accessory drive belt idler pulleys.

- Tighten the six retaining bolts to 23 Nm (17 lb.ft).

3. Connect the right-hand EGR coolant inlet hose to the EGR cooler.

- Install the coolant hose retaining clip.

4. Secure the EGR valve outlet tube clamps to the timing cover.

- Install the two retaining bolts.

5. Connect the coolant hose to the cylinder head coolant outlet elbow.

- Install the retaining clip.

6. Install the accessory drive belt idler.

- Install the retaining bolt and tighten to 47 Nm (35 lb.ft).

7. Install the crankshaft damper.

- Tighten the six retaining bolts to 23 Nm (17 lb.ft).

8. Install the fan cowl.
For additional information, refer to: Cooling Fan Shroud (303-03C Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).

9. Install the intake air shutoff throttle elbow support bracket.

- Install the three retaining bolts and tighten to 10 Nm (7 lb.ft).

10. Secure the intake air shutoff throttle elbow.

- Install the retaining clip.
- Install the retaining bolt.
- Connect the electrical connector.

11. Install the engine cover.

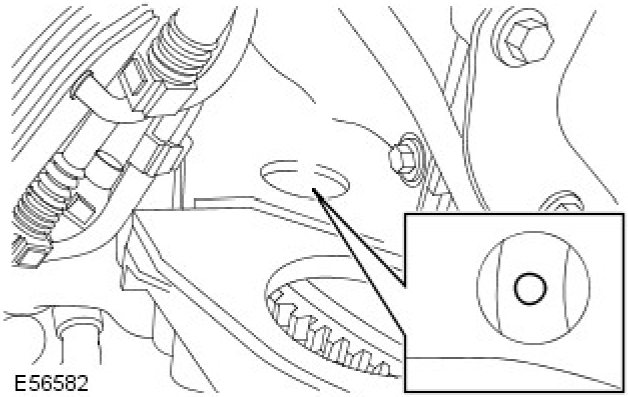
4. Remove the starter motor.
For additional information, refer to: Starter Motor (303-06C Starting System - TDV6 2.7L Diesel, Removal and Installation).

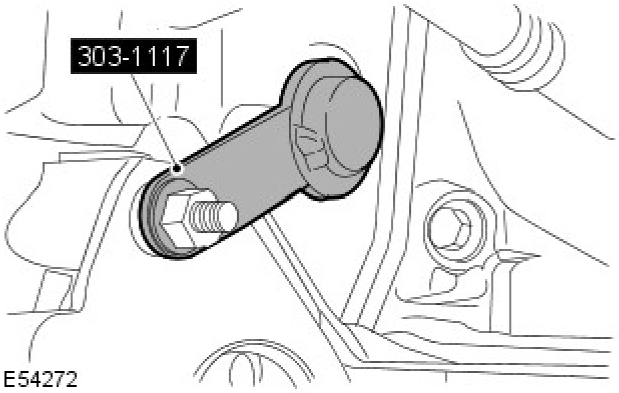
5. Remove the crankshaft timing alignment grommet from the engine block.

6. Rotate the crankshaft clockwise to align the crankshaft alignment hole in the flywheel or flexplate with the block aperture.



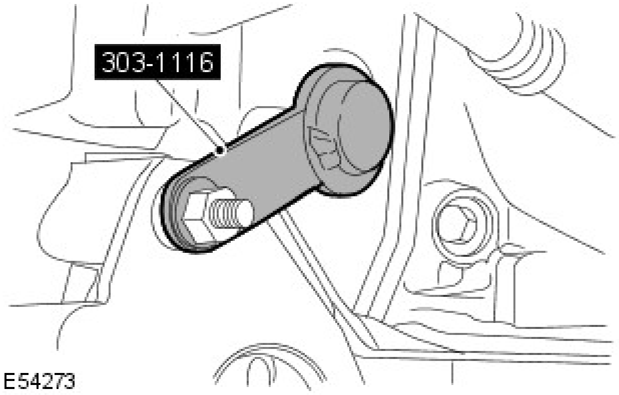
7. Check the camshaft pulley alignment holes are correctly aligned. If the alignment holes are not aligned, rotate the crankshaft one full turn clockwise.

Vehicles with automatic transmission



8. Using the special tool, lock the flexplate.
   - Install a starter motor bolt to retain the special tool.

Vehicles with manual transmission



9. Using the special tool, lock the flywheel.
   - Install a starter motor bolt to retain the special tool.

10. Install the special tools to the exhaust camshaft pulleys.

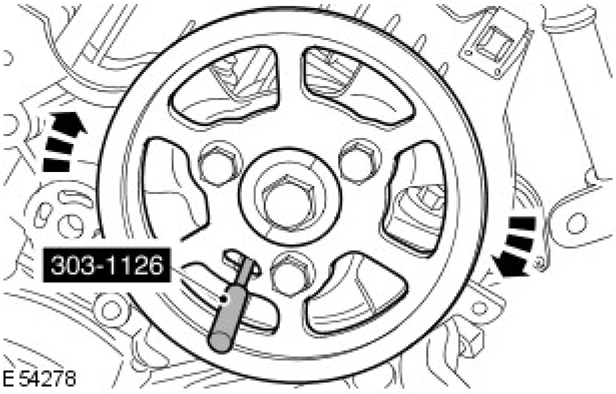
Installation

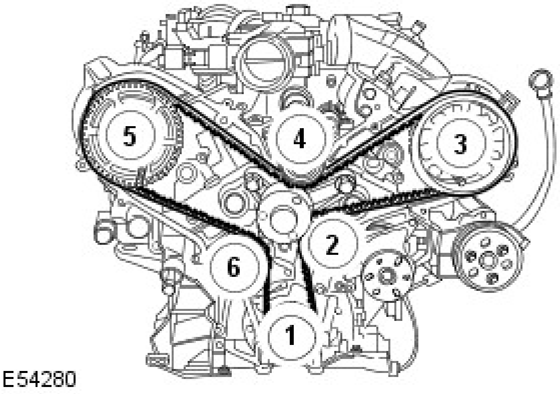
All vehicles

1. Rotate both camshaft pulleys clockwise.



2. Install a new timing belt tensioner.

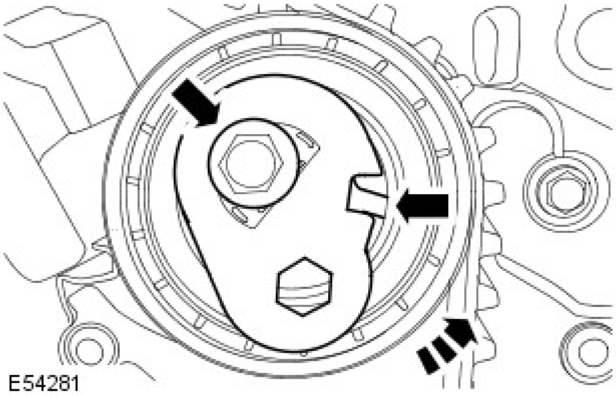
- Install a new bolt, but do not fully tighten at this stage.



3. ⚠ CAUTION: Make sure the camshaft pulleys remain in the clockwise position.

Install the new timing belt.

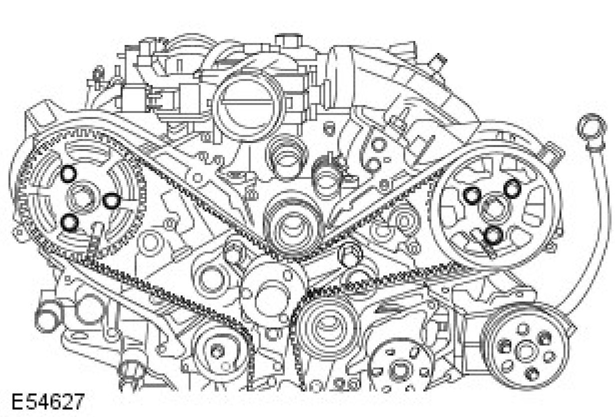
- Starting at the crankshaft pulley, install the timing belt in a counter-clockwise direction, in the sequence shown.
- Stage one: Attach the timing belt to the crankshaft pulley.
- Stage two: Attach the timing belt to the idler pulley.
- Stage three: Attach the timing belt to the left-hand camshaft pulley.
- Stage four: Attach the timing belt to the idler pulley.
- Stage five: Attach the timing belt to the RH camshaft pulley.
- Stage six: Attach the timing belt to the timing belt tensioner.



4. ⚠ CAUTION: Make sure the timing belt tensioner window is aligned with the groove.

Tension the timing belt.

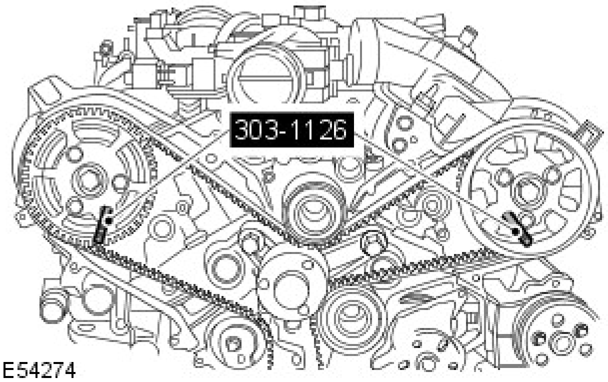
- Rotate the tensioner assembly counterclockwise.
- Tighten to 24 Nm (18 lb.ft).



5. ⚠CAUTION: Do not use the special tools to lock the camshafts. Failure to follow this instruction may result in damage to the engine or the special tools.

Using a suitable tool, counterhold the camshaft pulley center retaining bolts.

- Tighten the six exhaust camshaft pulley damper retaining bolts.
- Tighten the bolts to 23 Nm (17 lb.ft).



6. Remove the special tools from the camshaft pulleys.

Vehicles with manual transmission

7. Remove the special tool from the flywheel.

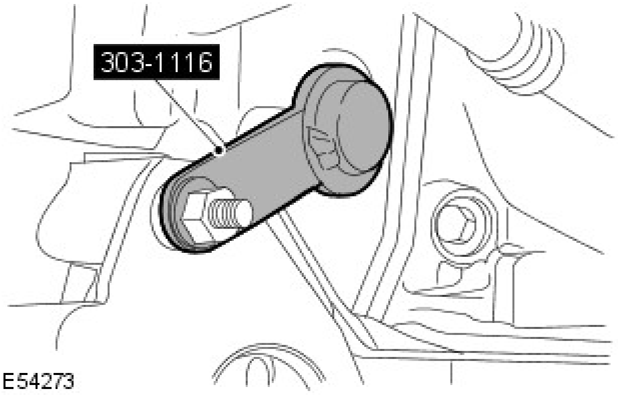
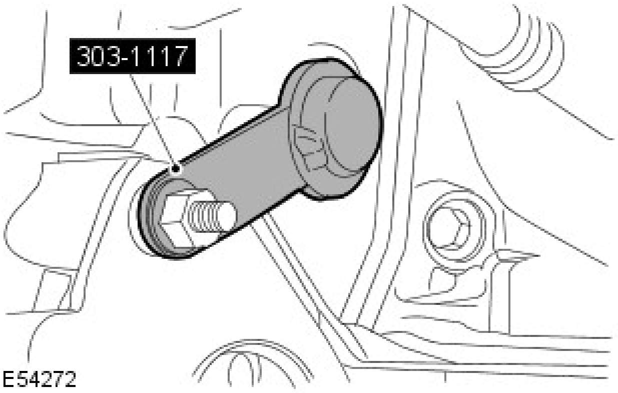
10. Using the special tool, lock the flywheel.

- Install a starter motor bolt to retain the special tool.

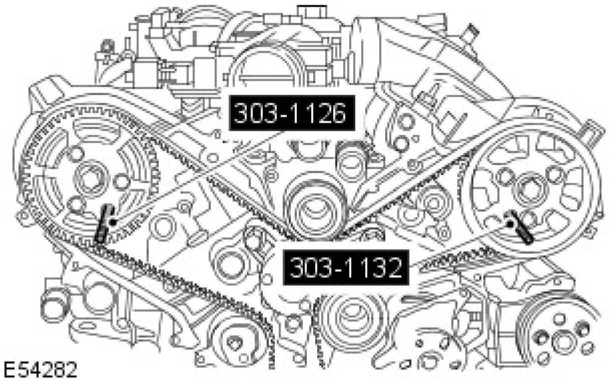


Vehicles with automatic transmission



11. Using the special tool, lock the flexplate.

- Install a starter motor bolt to retain the special tool.



12. Install the special tools to the exhaust camshaft pulleys.

- If the special tool does not fit correctly, repeat the timing belt installation procedure.
- Remove the special tools from the camshaft pulleys.

Vehicles with manual transmission

13. Remove the special tool from the flywheel.

- Install the grommet.

4. Install the LH exhaust manifold heat shield.

   - Install the two retaining bolts and tighten to 10 Nm (7 lb.ft).

5. Install the LH EGR valve.

   - Install the three EGR valve retaining bolts, but do not fully tighten at this stage.

6. NOTE: Do not fully close the retaining clip at this stage.

   Install the LH EGR valve inlet tube.

   - Install a new retaining clip.
   - Install a new gasket.
   - Loosely install the two EGR valve inlet tube retaining bolts.

7. Fully close the retaining clip.
8. Tighten the two EGR valve inlet tube retaining bolts to 10 Nm (7 lb.ft).
9. Tighten the three EGR valve retaining bolts to 10 Nm (7 lb.ft).

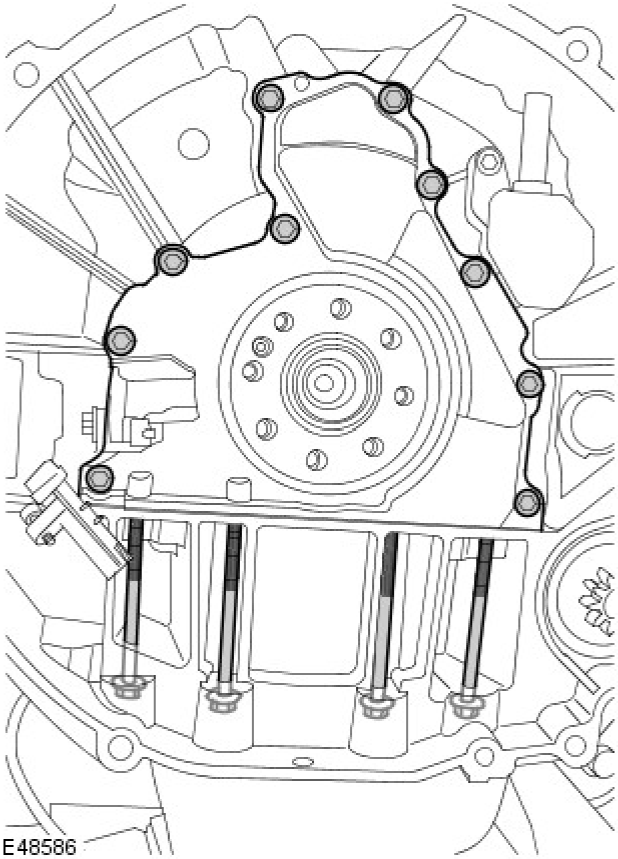
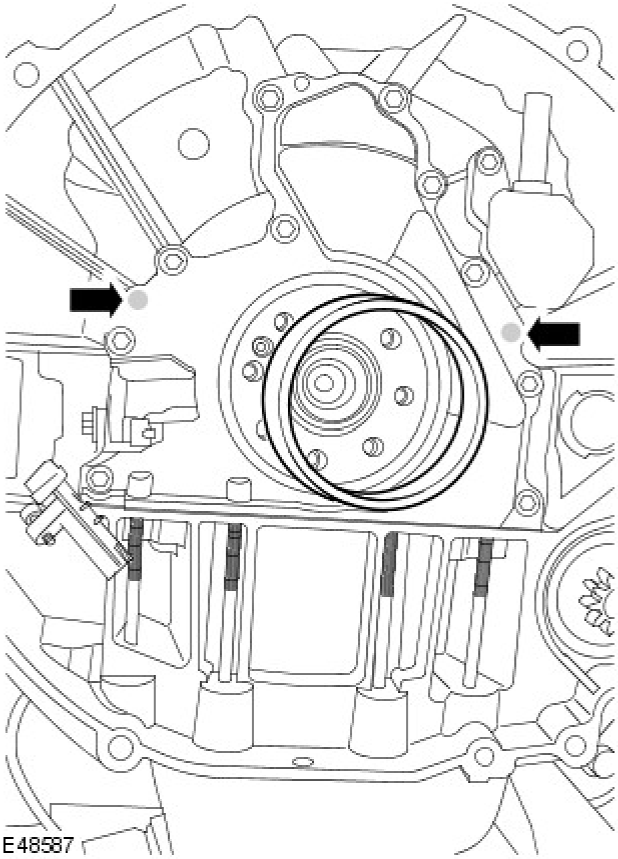
- Remove the 14 bolts.



Installation



1. CAUTIONS:

⚠ Oil seals must be fitted dry.

⚠ Tighten the bolts securing the seal retainer to the cylinder block first.

Install the crankshaft seal retainer plate.

- Clean the component mating faces.
- Install the seal retainer with its protection sleeve onto the crankshaft.
- Locate the seal retainer onto the sump flange.
- Engage the seal retainer dowels with the cylinder block and lightly tighten 2 bolts on opposite sides of the retainer.
- Remove the seal protection sleeve.

Installation

1. CAUTIONS:

⚠ Apply grease of the correct specification to the torque converter spigot.

⚠ Make sure the torque converter is fully located into the oil pump drive.

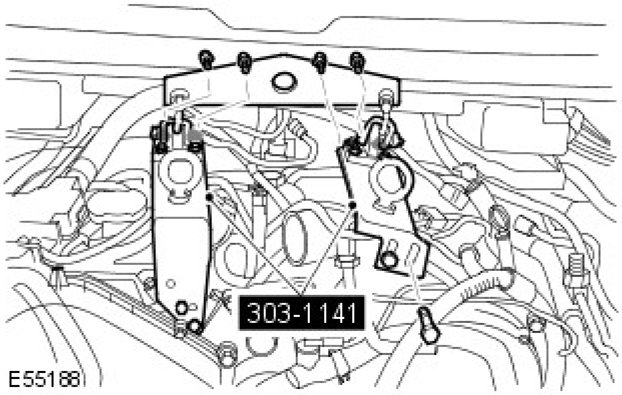
With assistance, carefully install the engine.

- Clean the component mating faces.

2. ⚠ CAUTION: Make sure the torque converter remains connected to the transmission.

Secure the engine to the transmission.

- Tighten the bolts to 45 Nm (33 lb.ft).
- Remove the jack supporting the transmission.



3. Remove the special tool.

- Remove the bolts.

4. Secure both the LH and the RH engine mounts.

- Lower the engine onto its mounts.
- Tighten the nuts to 90 Nm (66 lb.ft).

5. NOTE: Make sure that new bolts are installed.

Secure the flexplate to the torque converter.

- Tighten the bolts to 45 Nm (33 lb.ft).

- Install the access plug.

6. Install the starter motor.

- Tighten the bolts to 48 Nm (35 lb.ft).

7. Connect the 2 starter motor wiring harness connectors to the starter motor solenoid.

- Tighten the solenoid terminal integral connector nut to 8 Nm (6 lb.ft).
- Tighten the battery positive cable nut to 11 Nm (8 lb.ft).
- Install the rubber insulator.

8. Install the starter motor support bracket.

- Tighten the 4 bolts maked 2 to 25 Nm (18 lb. ft).
- Tighten the 2 bolts maked 1 to 25 Nm (18 lb. ft).
- Tighten the 2 bolts maked 3 to 25 Nm (18 lb. ft).
- Attach the wiring harness.

20. Secure the battery positive cable.

- Secure with the clip.

21. Secure the transmission fluid lines.

- Tighten the nut to 10 Nm (7 lb.ft).

22. Install the turbocharger intake tube.

- Tighten the clip.

23. Reposition the lower coolant hose.

24. NOTE: Remove and discard the blanking caps.

Connect the A/C compressor high-pressure line.

- Install a new O-ring seal.
- Tighten the bolt to 9 Nm (7 lb.ft).

25. Install the charge air cooler inlet pipe.

26. Position the power steering pump to the power steering pump bracket.

- Loosely install the rear bolt.

27. Secure the power steering pump.

- Tighten the 3 front bolts to 22 Nm (16 lb.ft).
- Loosen the 3 front bolts by a quarter of a turn.
- Tighten the rear bolt to 22 Nm (16 lb.ft).
- Tighten the 3 front bolts to 22 Nm (16 lb.ft).

28. Connect the coolant lower hose.

- Secure with the clip.

29. Connect the charge air cooler inlet hoses.

- Tighten the clips.

30. NOTE: Remove and discard the blanking caps.

Connect the A/C compressor low-pressure pipe.

- Install a new O-ring seal.
- Tighten the bolt to 9 Nm (7 lb.ft).

31. Secure the charge air cooler inlet pipe.

- Tighten the bolt to 10 Nm (7 Lb.ft).
- Tighten the nuts to 10 Nm (7 lb.ft).

32. Connect the breather hose.

- Secure with the clip.

33. Install the 2 LH upper suspension arm and brake line heat shields.

- Tighten the bolts to 10 Nm (7 Lb.ft).
- Tighten the nuts to 10 Nm (7 lb.ft).

34. Install the accessory drive belt.

- Rotate the accessory drive belt tensioner counter-clockwise.

35. Connect the RH EGR coolant hose.

- Secure with the clip.

36. Connect the upper coolant hose to the coolant distribution manifold.

- Install the clip.

37. Install the intake air shutoff throttle elbow support bracket.

- Tighten the bolts to 10 Nm (7 Lb.ft).

38. Install the intake air shut off valve.
For additional information, refer to: Intake Air Shutoff Throttle (303-04C Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

39. Install the cooling fan shroud.

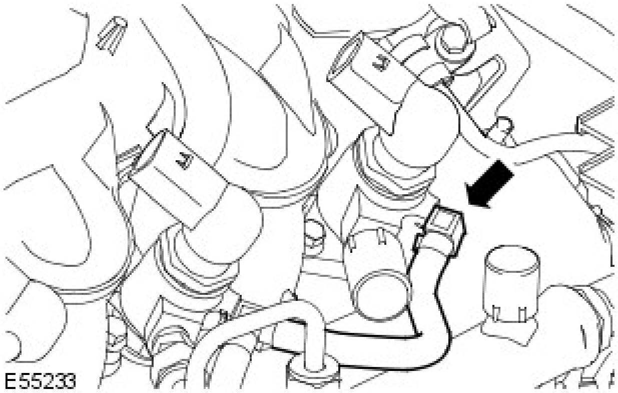
48. CAUTIONS:

⚠ Make sure the high-pressure fuel supply line remains in contact with both the fuel injector and the fuel injection supply manifold until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠ Make sure that the fuel injector adaptor union does not move when loosening the high-pressure fuel supply lines. Failure to follow this instruction may result in damage to the fuel injector or the fuel injector adaptor union.

⚠ Make sure that all openings are sealed. Use new blanking caps.

Remove and discard the 6 high-pressure fuel supply lines.



49. Disconnect the fuel return line from the fuel injectors.

- Remove and discard the 6 clips.

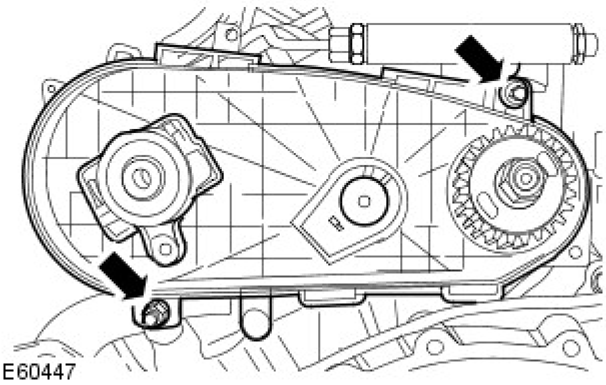
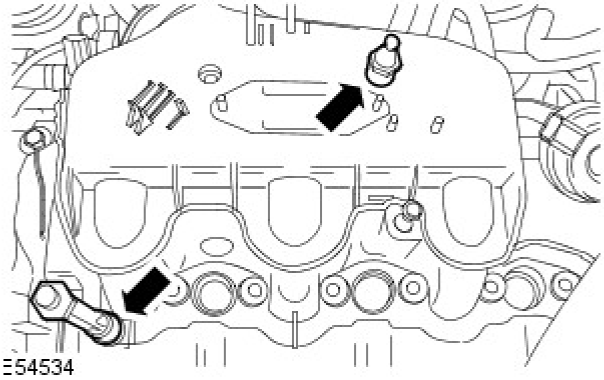
63. Remove the camshaft rear pulley.

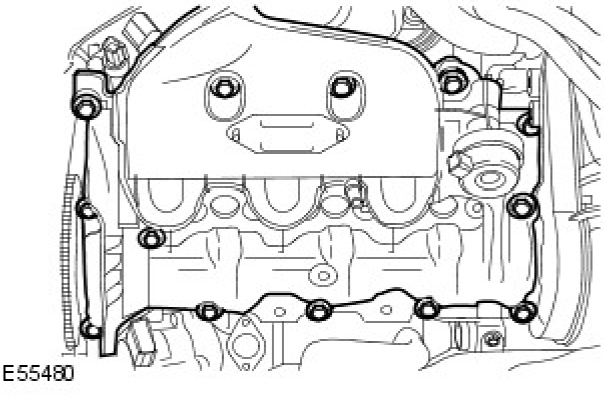


64. Remove the fuel injection pump belt rear cover.

- Fully loosen the 2 bolts.

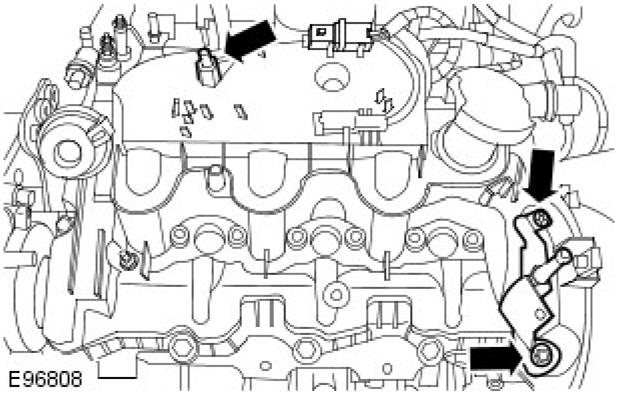


65. Remove the LH engine cover locating studs.



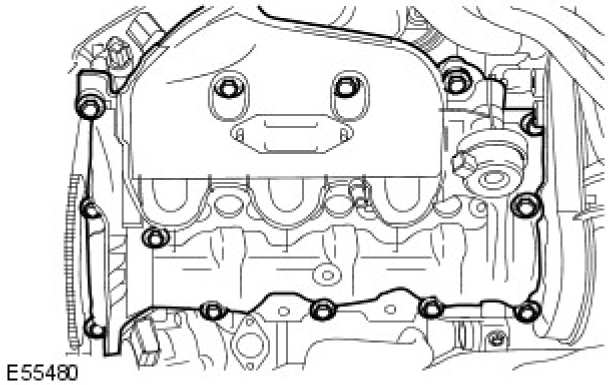
66. Remove the LH valve cover.

- Release the KS electrical connector from the valve cover.
- Fully loosen the 13 bolts.
- Remove the fuel line support bracket.
- Remove and discard the gasket.



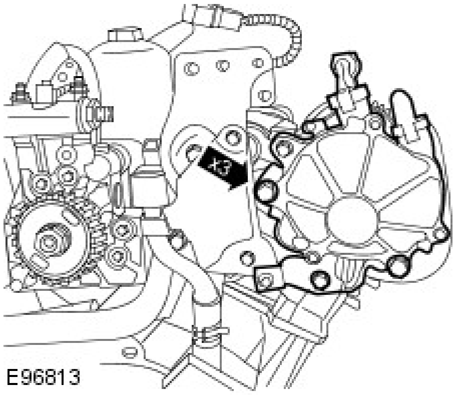
67. Remove the RH engine cover locating studs.

- Remove the nut.
- Remove the bolt.
- Remove the bracket.



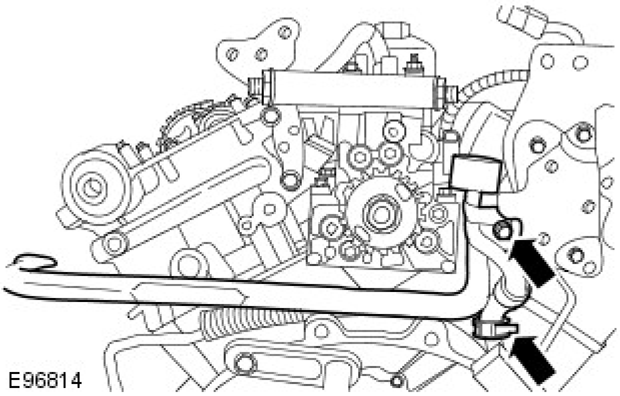
68. Remove the RH valve cover.

- Release the glow plug electrical connector from the valve cover.
- Release the KS electrical connector from the valve cover.
- Fully loosen the 13 bolts.
- Remove and discard the gasket.



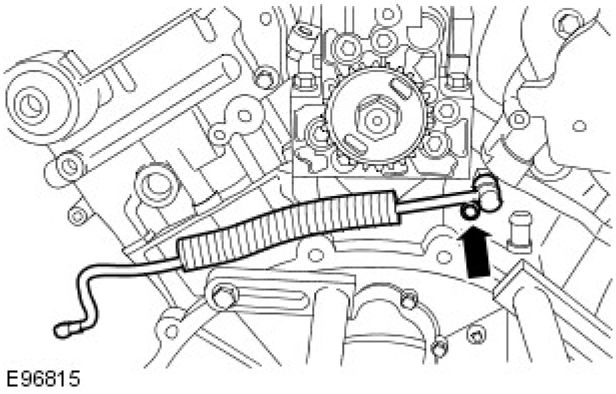
69. Remove the brake vacuum pump.

- Remove the 3 bolts.
- Remove the bracket.
- Remove and discard the gasket.



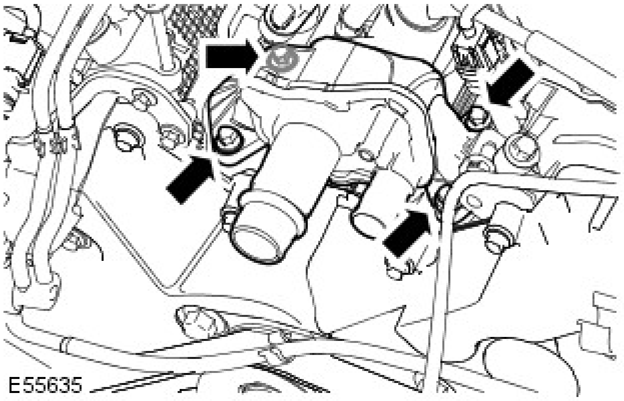
70. Remove the breather line.

- Remove the bolt.
- Release the clip.



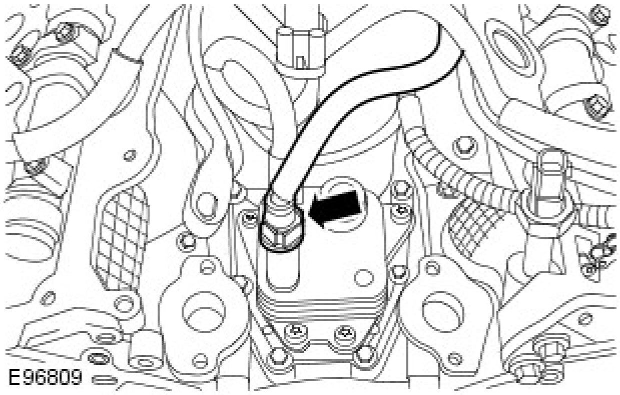
71. Remove the turbocharger oil supply line.

- Remove the bolt.
- Remove and discard the 2 O-ring seals.



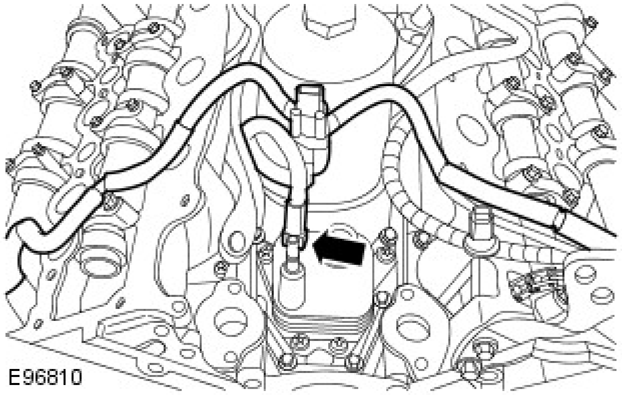
72. Remove the cylinder head coolant outlet assembly.

- Remove the 4 bolts.
- Remove and discard the O-ring seal.



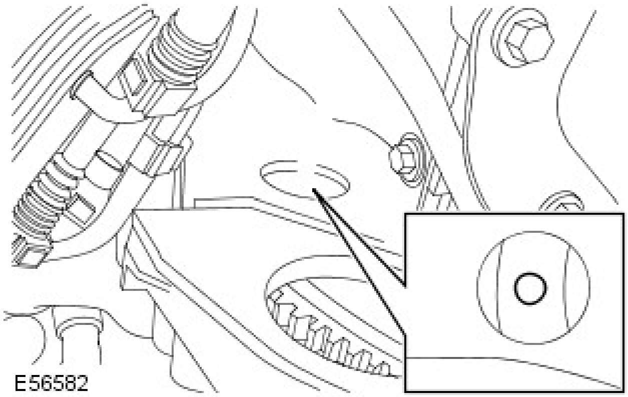
73. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Disconnect the fuel pipe from the fuel cooler.



74. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Remove and discard the fuel injector return line.

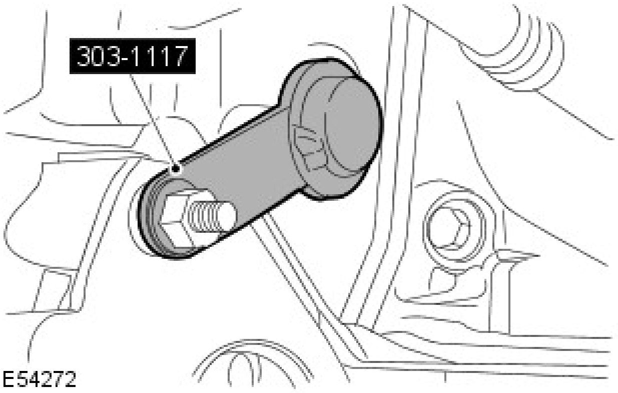


75. Rotate the crankshaft clockwise to align the crankshaft alignment hole in the flywheel or flexplate with the cylinder block aperture.

76. Check the camshaft pulley alignment holes are correctly aligned. If the alignment holes are not aligned, rotate the crankshaft one full turn clockwise.

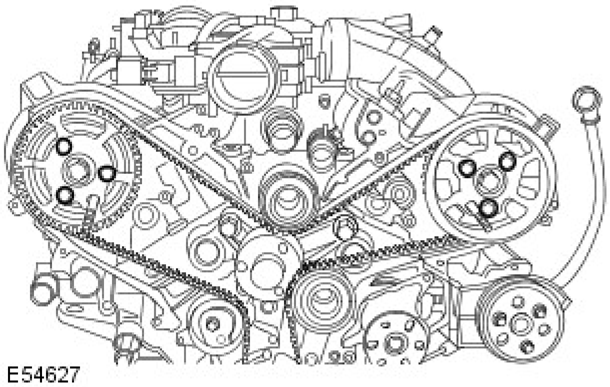
77. Using the special tool, lock the flexplate.

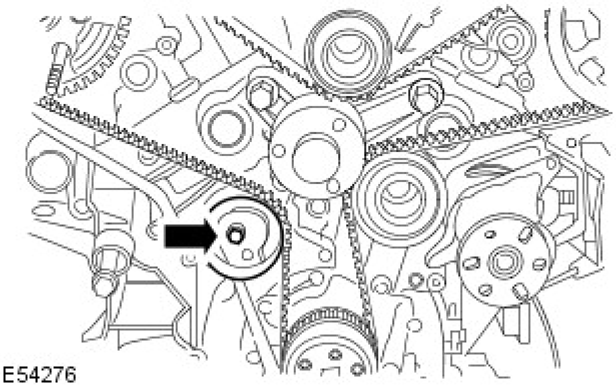
- Install a starter motor bolt to retain the special tool.



78. ⚠CAUTION: Do not use the special tools to lock the camshafts. Failure to follow this instruction may result in damage to the engine or the special tools.

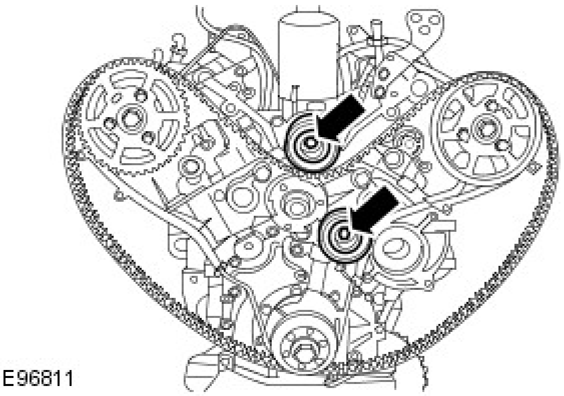
Loosen the 6 exhaust camshaft pulley bolts.





79. Remove and discard the timing belt tensioner.

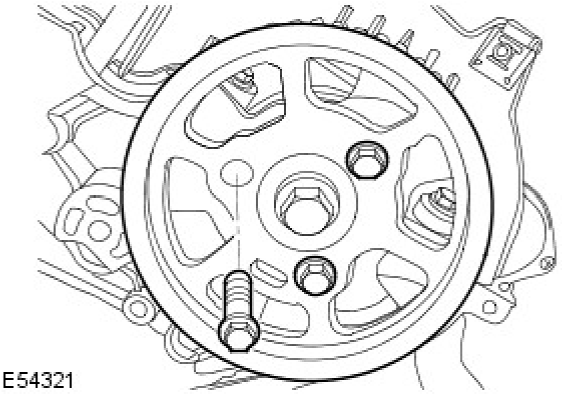
- Remove the bolt.



80. Remove the 2 timing belt idler pulley's.

- Remove the 2 bolts.
- Collect the plastic shield from behind the upper idler pulley.

81. Remove and discard the timing belt.



82. NOTE: LH shown, RH is similar.

Remove the 2 camshaft pulleys.

- Remove the 6 bolts.

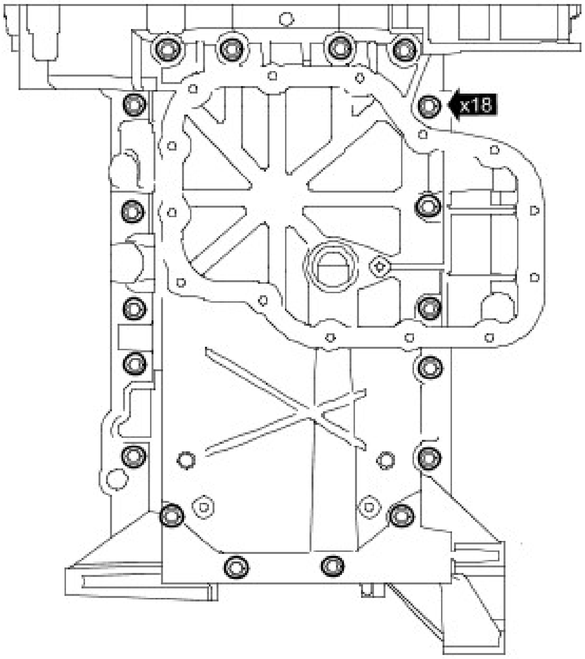
1. NOTE: Clean the component mating faces.

• NOTE: It is important that the oil pan extension is bolted to the crankshaft main bearing carrier within twenty minutes of applying the sealant.

Apply an 8 mm bead of sealant to the cylinder block in the areas shown.

- Use WSS-M4G323-A4-RTV sealant.

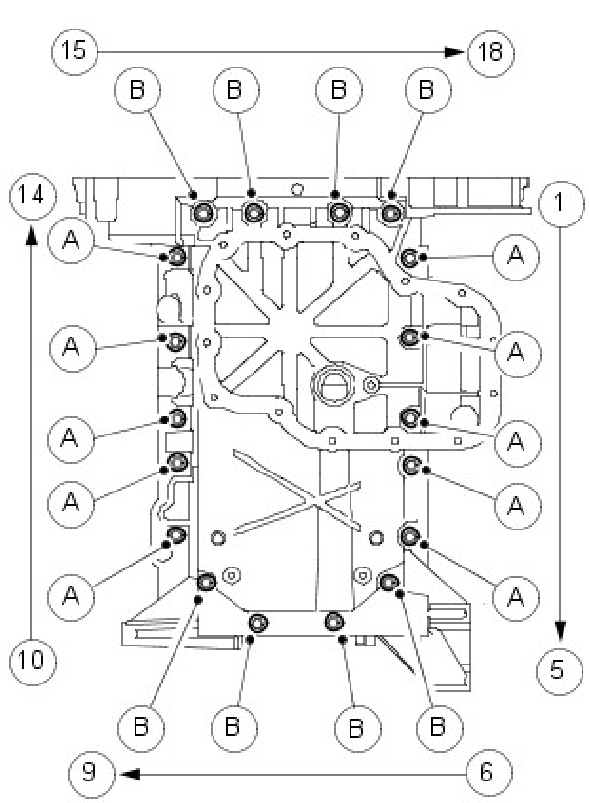


E93945

2. NOTE: Clean the component mating faces.

Install the oil pan extension.

- Install a new gasket.
- Loosely install the bolts.



E93962

3. ⚠ CAUTION: Tighten the bolts in the indicated sequence in 2 stages.

Secure the oil pan extension.

1. Tighten bolts A to 10 Nm (7 lb.ft). Tighten bolts B to 4 Nm (2 lb.ft).
2. Tighten bolts A to 24 Nm (18 lb.ft). Tighten bolts B to 10 Nm (7 lb.ft).

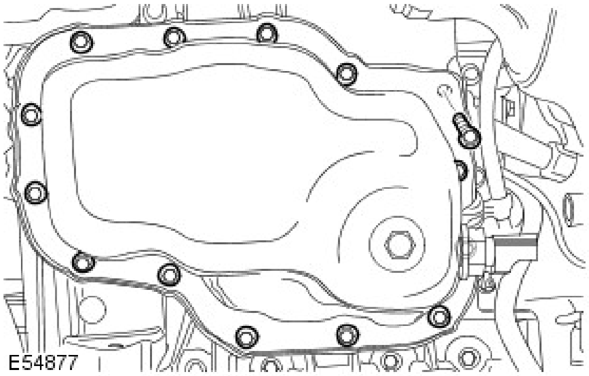
4. NOTE: Lubricate the new seals with clean engine oil.

• NOTE: Clean the components.

Install the oil pump screen and pickup tube.

- Clean the components.
- Install new O-ring seals.
- Tighten the bolt to 10 Nm (7 lb.ft).

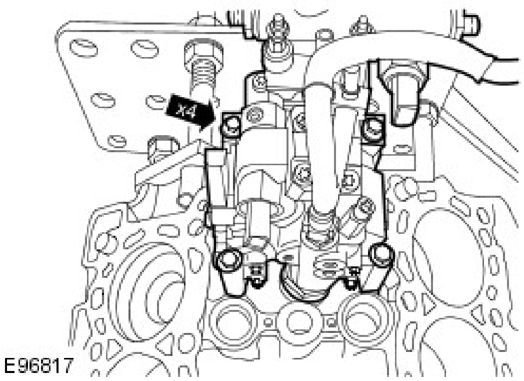


E54877

5. NOTE: Clean the component mating faces.

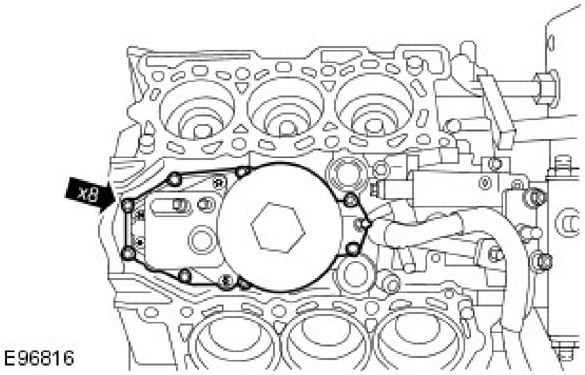
Install the oil pan.

- Install a new gasket.
- Evenly and progressively tighten the bolts to 10 Nm (7 lb.ft).



6. Install the fuel injection pump.

- Tighten the bolts to 23 Nm (17 lb.ft).

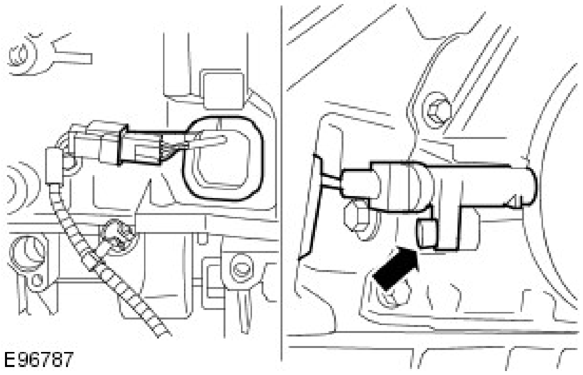


7. ⚠ CAUTION: Make sure the gasket is installed correctly.

• NOTE: Clean the component mating faces.

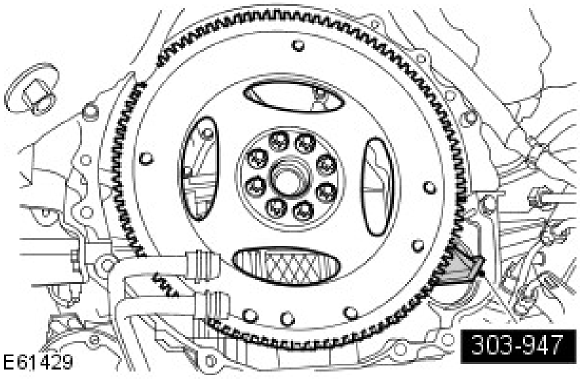
Install the oil cooler assembly.

- Install a new gasket.
- Install a new O-ring seal.
- Tighten the bolts to 10 Nm (7 lb.ft).



8. Install the crankshaft position (CKP) sensor.

- Tighten the bolt to 5 Nm (4 lb.ft).
- Connect the electrical connector.
- Reposition the access cover.



9. CAUTIONS:

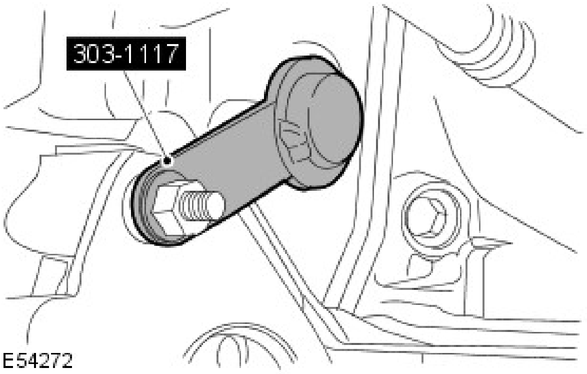
⚠ Tighten the bolts in a diagonal sequence.

⚠ Tighten the bolts in the stages shown.

• NOTE: Clean the component mating faces.

Install the flexplate.

- Using the special tool, lock the flexplate.
- Stage 1: Tighten the bolts to 50 Nm (37 lb.ft).
- Stage 2:Tighten the bolts 45 degrees.
- Stage 3:Tighten the bolts a further 45 degrees.
- Remove the special tool.



10. Using the special tool, lock the flexplate.

- Rotate the crankshaft clockwise to align the crankshaft alignment hole in the flywheel or flexplate with the cylinder block aperture.
- Install a starter motor bolt to retain the special tool.

11. Check the LH cylinder head face for distortion, across the center and from corner to corner.

12. NOTE: The cylinder head gasket must be installed over the cylinder head to cylinder block dowels.

• NOTE: Clean the component mating faces.

Install a new LH cylinder head gasket.

13. CAUTIONS:

⚠ Use care when installing the cylinder head. Damage to the cylinder block, cylinder head or cylinder head gasket may result.

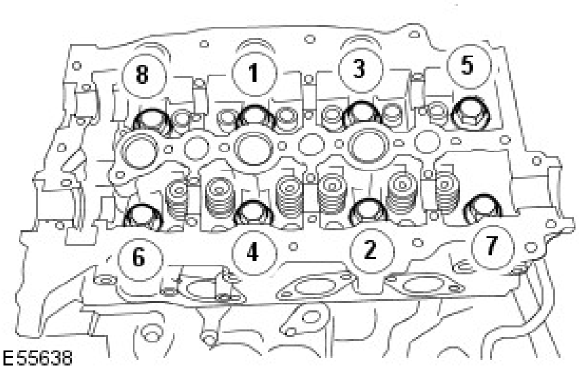
⚠ Make sure that new bolts are installed.

• NOTE: The cylinder head gasket must be installed over the cylinder head to cylinder block dowels.

• NOTE: Make sure the cylinder head is installed in its original position.

• NOTE: Tighten the bolts in the indicated sequence in 4 stages.

• NOTE: Clean the component mating face.



Install the LH cylinder head assembly.

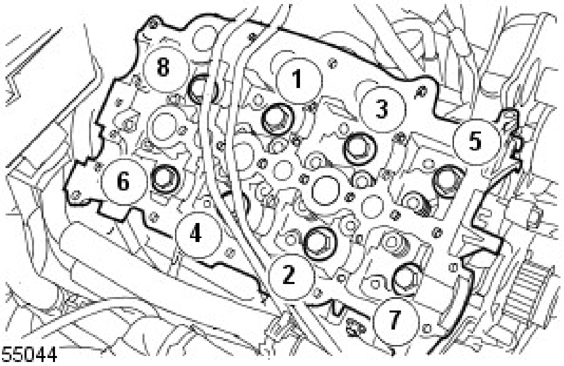
- Stage 1: Tighten the bolts to 20 Nm (15 lb.ft).
- Stage 2: Tighten the bolts to 40 Nm (30 lb.ft).
- Stage 3: Tighten the bolts to 80 Nm (59 lb.ft).
- Stage 4: Tighten the bolts a further 180 degrees.

14. Check the RH cylinder head face for distortion, across the center and from corner to corner.

15. NOTE: The cylinder head gasket must be installed over the cylinder head to cylinder block dowels.

• NOTE: Clean the component mating faces.

Install a new RH cylinder head gasket.



E55044

16. CAUTIONS:

⚠ Use care when installing the cylinder head. Damage to the cylinder block, cylinder head or cylinder head gasket may result.

⚠ Make sure that new bolts are installed.

• NOTE: The cylinder head gasket must be installed over the cylinder head to cylinder block dowels.

• NOTE: Make sure the cylinder head is installed in its original position.

• NOTE: Tighten the bolts in the indicated sequence in four stages.

Install the RH cylinder head assembly.

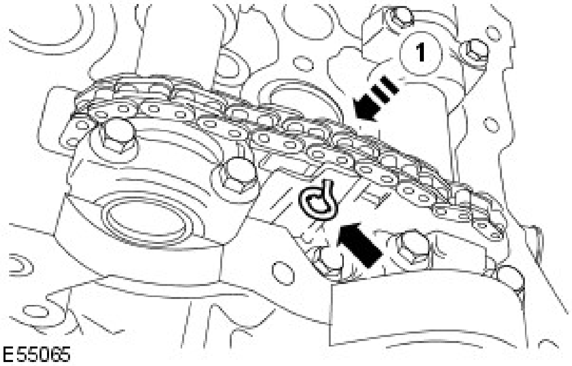
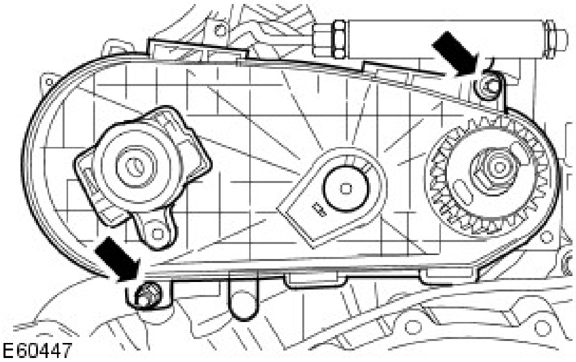
- Stage 3: Tighten the bolt to 10 Nm (7 lb.ft).



E55065

32. Release the LH bank secondary timing chain tensioner piston.

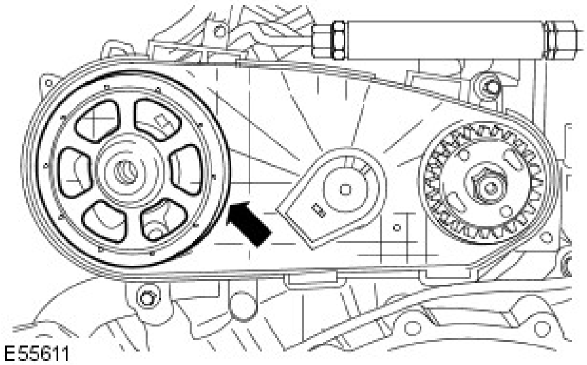
- Remove the locking pin.



E60447

33. Install the fuel injection pump belt rear cover.

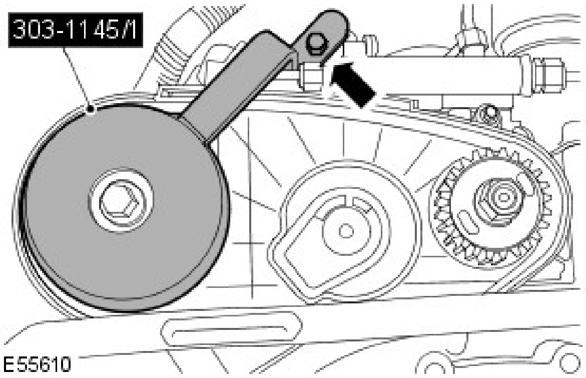
- Tighten the bolts to 10 Nm (7 lb.ft).



E55611

34. Install the camshaft rear pulley.

- Install a new camshaft pulley bolt.



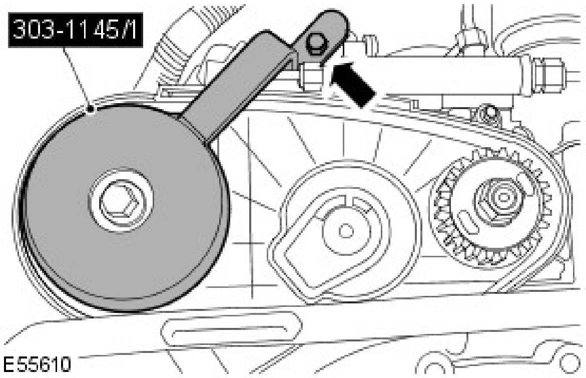
35. Install the special tool to the camshaft rear pulley.

- Install and tighten the bolt.

36. ⚠ CAUTION: Tighten the bolts in the stages shown.

Secure the camshaft rear pulley.

- Stage 1: Tighten the bolt to 40 Nm (30 lb.ft).
- Stage 2: Tighten the bolt to 75 Nm (56 lb.ft).



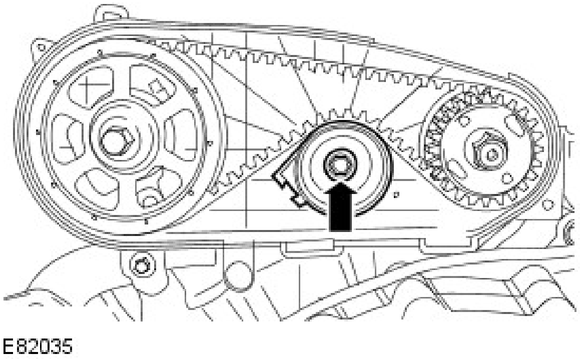
37. Remove the special tools.

- Remove the bolt.

38. ⚠ CAUTION: Do not install the new fuel injection pump belt to the pulleys with the fuel pump belt tensioner installed. Failure to follow this instruction may result in damage to the fuel pump belt.

• NOTE: The fuel injection pump rotates in a counter-clockwise direction when viewed from the rear of the engine.

Install the new fuel injection pump belt.



39. CAUTIONS:

⚠ Make sure that the fuel injection pump belt tensioner locking pin is not removed until the fuel injection pump belt tensioner is fully installed.

⚠ Make sure that the fuel injection pump belt tensioner tang is correctly located to the fuel injection pump belt rear cover. Failure to follow this instruction may result in damage to the engine.

Install a new fuel injection pump belt tensioner.

- Locate the tang on the new fuel injection pump belt tensioner into the fuel injection pump rear cover.
- Tighten the bolt to 25 Nm (18 lb.ft).
- Remove and discard the fuel injection pump belt tensioner locking pin.

40. Install the fuel injection pump belt cover.

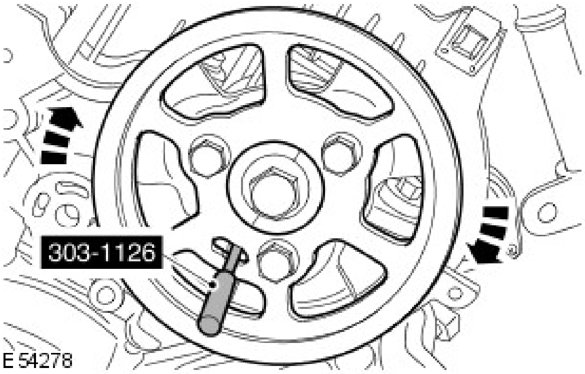
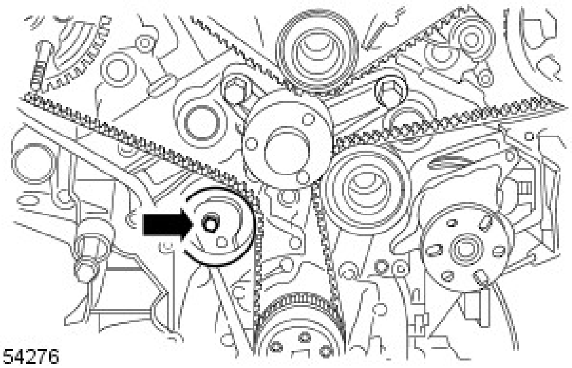
45. Install the 2 timing belt idler pulleys.

- Install the plastic shield behind the upper idler pulley.
- Tighten the bolts to 45 Nm (33 lb.ft).



E54278

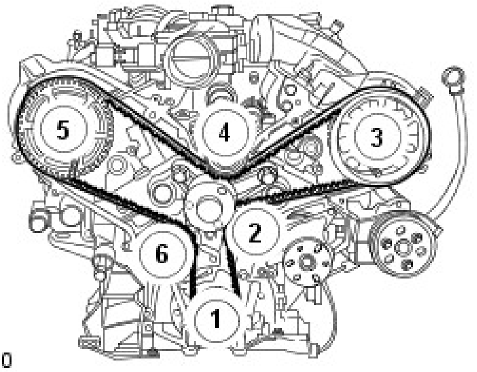
46. Rotate both camshaft pulleys clockwise.



E54276

47. Install a new timing belt tensioner.

- Install a new bolt, but do not fully tighten at this stage.

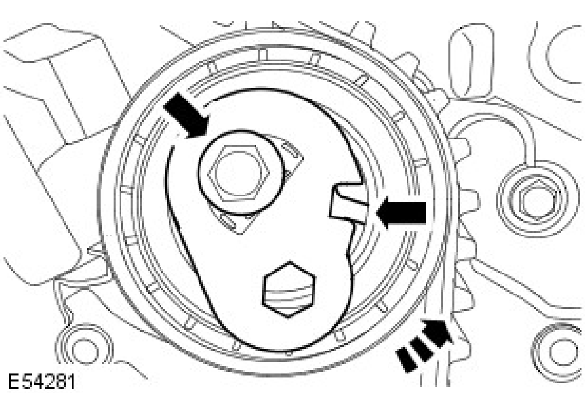


E54280

48. ⚠ CAUTION: Make sure the camshaft pulleys remain in the clockwise position.

Install the new timing belt.

- Starting at the crankshaft pulley, install the timing belt in a counter-clockwise direction, in the sequence shown.
- Stage 1: Attach the timing belt to the crankshaft pulley.
- Stage 2: Attach the timing belt to the idler pulley.
- Stage 3: Attach the timing belt to the left-hand camshaft pulley.
- Stage 4: Attach the timing belt to the idler pulley.
- Stage 5: Attach the timing belt to the RH camshaft pulley.
- Stage 6: Attach the timing belt to the timing belt tensioner.

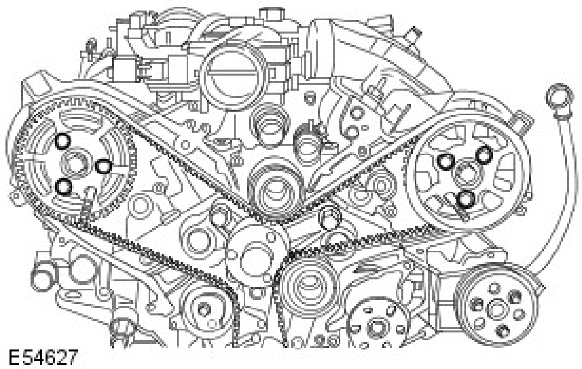


E54281

49. CAUTION: Make sure the timing belt tensioner window is aligned with the groove.

Tension the timing belt.

- Rotate the tensioner assembly counter-clockwise.
- Tighten the bolt to 24 Nm (18 lb.ft).

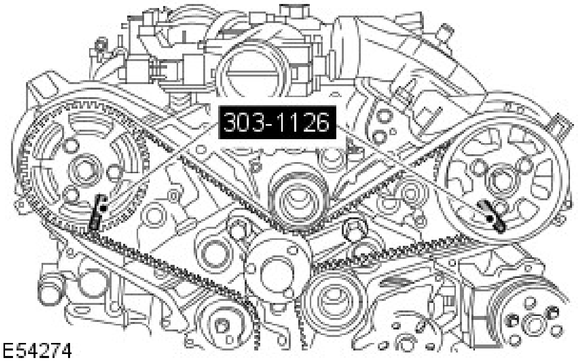


E54627

50. CAUTION: Do not use the special tools to lock the camshafts. Failure to follow this instruction may result in damage to the engine or the special tools.

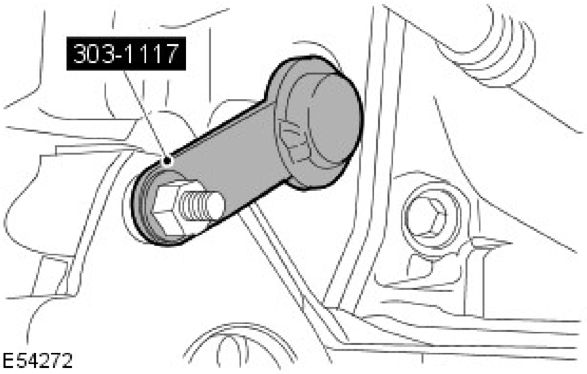
Secure the camshaft pulleys.

- Using a suitable tool, hold the camshaft pulley center bolts.
- Tighten the bolts to 23 Nm (17 lb.ft).



E54274

51. Remove the special tools.

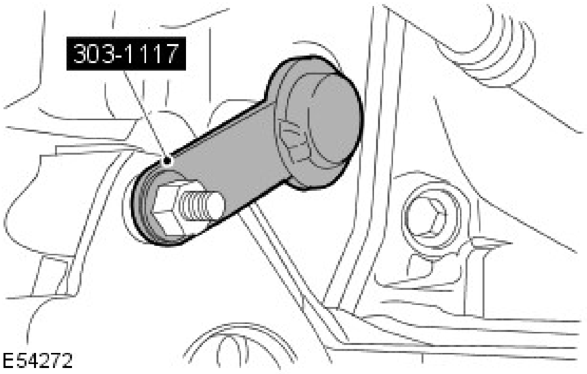


E54272

52. Remove the special tool.

- Remove the bolt.

53. Rotate the engine two complete turns clockwise.



303-1117

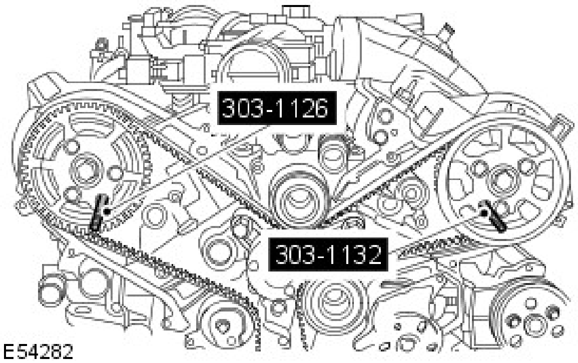
54. Using the special tool, lock the flexplate.

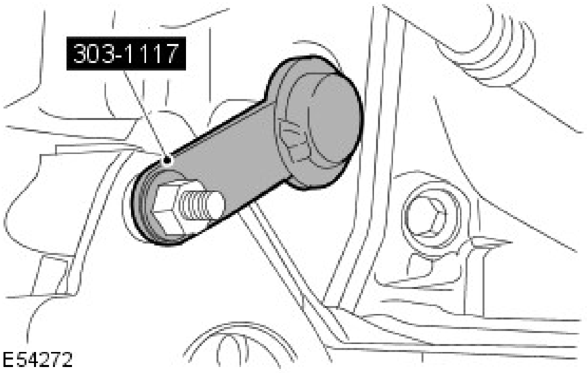
- Install a starter motor bolt to retain the special tool.



303-1126
303-1132
E54282

55. Install the special tools to the exhaust camshaft pulleys.

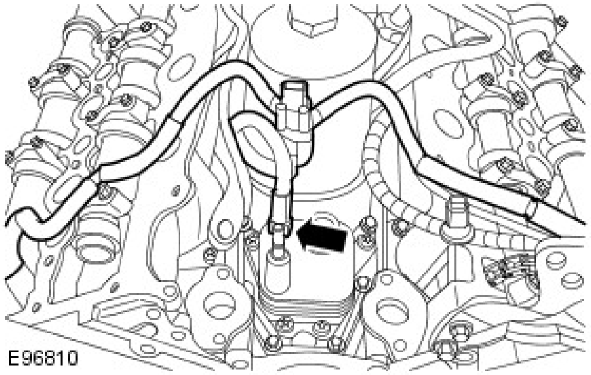
- If the special tool does not fit correctly, repeat the timing belt installation procedure.
- Remove the special tools from the camshaft pulleys.



303-1117
E54272

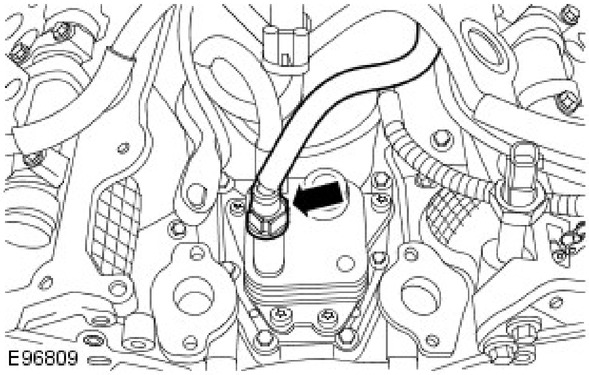
56. Remove the special tool.

- Remove the bolt.



57. NOTE: Remove and discard the blanking caps.

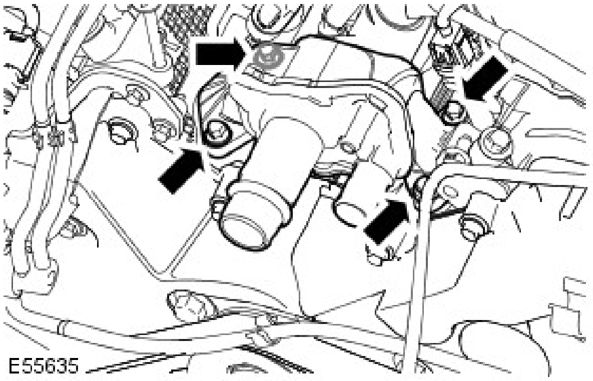
Install a new fuel injector return line.



E96809

58. NOTE: Remove and discard the blanking caps.

Connect the fuel pipe to the fuel cooler.



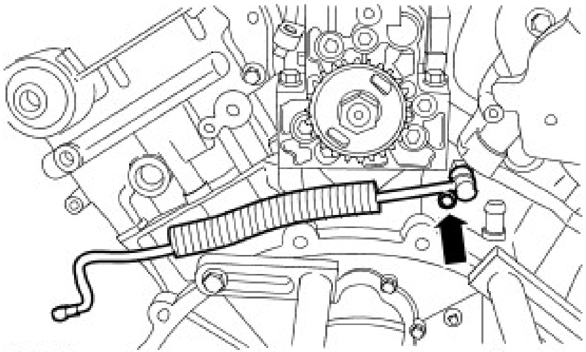
E55635

59. NOTE: Install new O-ring seals.

• NOTE: Make sure that all the component mating faces are clean.

Install the cylinder head coolant outlet assembly.

- Tighten the bolts to 10 Nm (7 lb.ft).

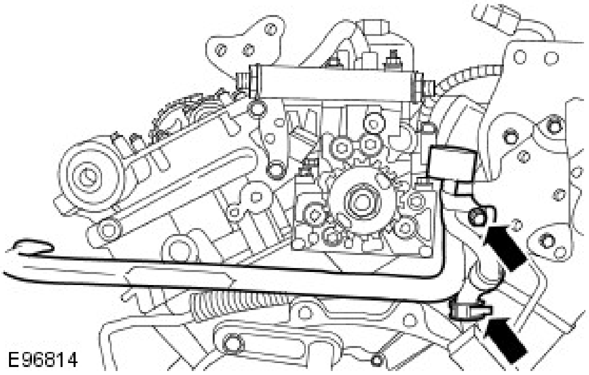


E96815

60. NOTE: Install new O-ring seals.

Install the turbocharger oil supply line.

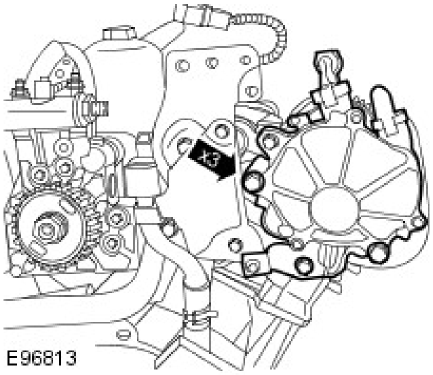
- Tighten the bolts to 10 Nm (7 lb.ft).



E96814

61. Install the breather line.

- Secure the clip.
- Tighten the bolt to 10 Nm (7 lb.ft).

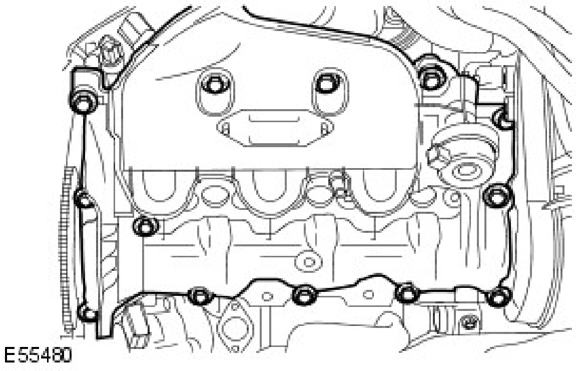


62. NOTE: Clean the component mating faces.

• NOTE: Install a new gasket.

Install the brake vacuum pump.

- Install the bracket.
- Tighten the bolts to 23 Nm (17 lb.ft).

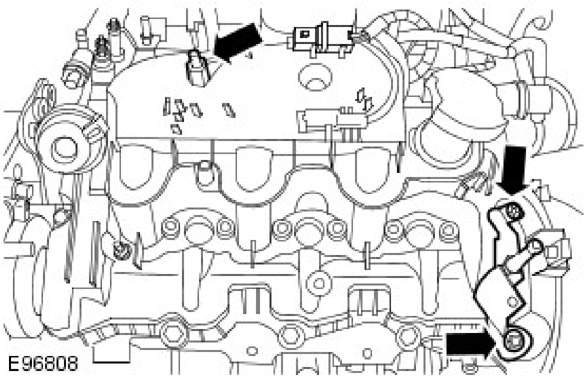


63. NOTE: Clean the component mating faces.

• NOTE: Install a new gasket.

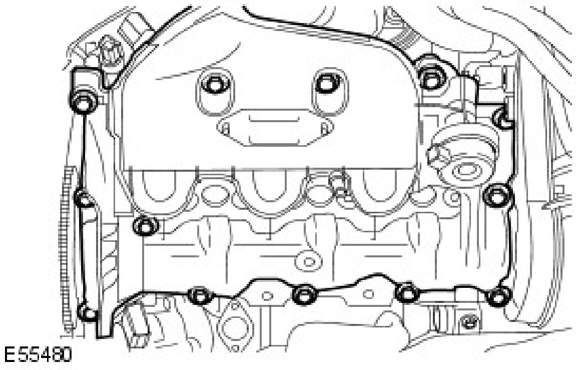
Install the RH valve cover.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Secure the glow plug electrical connector in the valve cover.
- Secure the knock sensor (KS) electrical connector in the valve cover.



64. Install the RH engine cover locating studs.

- Install the bracket.
- Tighten the nut to 10 Nm (7 lb.ft).
- Tighten the bolt to 10 Nm (7 lb.ft).

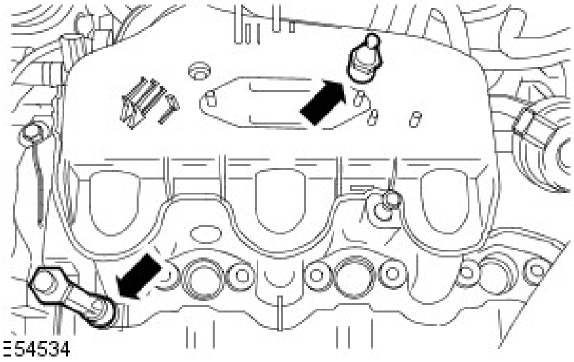


65. NOTE: Clean the component mating faces.

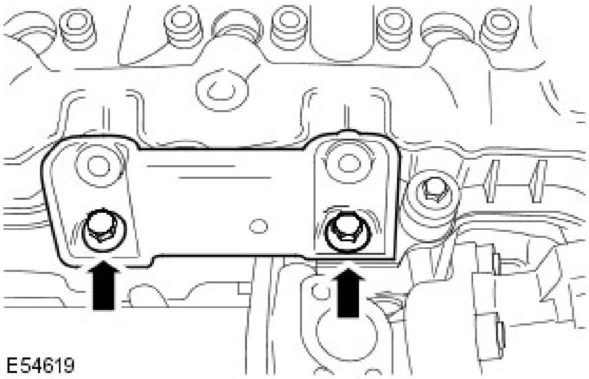
• NOTE: Install anew gasket.

Install the LH valve cover.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Secure the KS electrical connector in the valve cover.

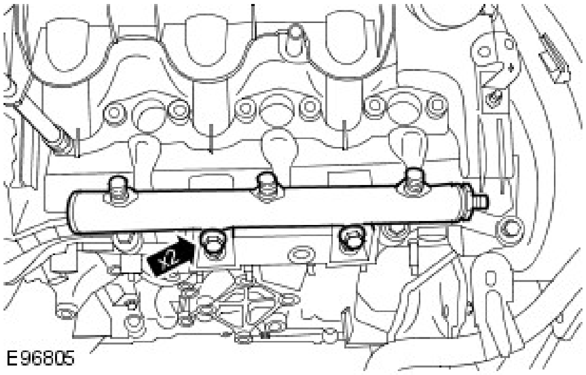


66. Install the LH engine cover locating studs.



67. Install the fuel rail brackets.

- Tighten the bolts to 23 Nm (17 lb.ft).



68. Install the fuel rails.

- Install the bolts, but do not tighten fully at this stage.

Vehicles built up to 12/2006

69. NOTE: Remove and discard the blanking caps.

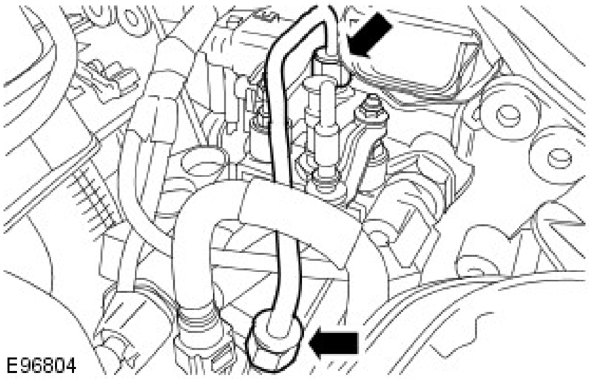
Install the new RH fuel rail high-pressure supply line.

- Tighten the fuel injection supply manifold retaining bolts to 23 Nm (17 lb.ft).
- Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 15 Nm (11 lb.ft).
- Stage 2: Tighten the high-pressure fuel supply line union at the fuel rail to 15 Nm (11 lb.ft).
- Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 30 Nm (22 lb.ft).
- Stage 4: Tighten the high-pressure fuel supply line union at the fuel rail to 30 Nm (22 lb.ft).
- Secure the clip.

70. NOTE: Remove and discard the blanking caps.

Install the new LH fuel rail high-pressure supply line.

- Tighten the fuel injection supply manifold retaining bolts to 23 Nm (17 lb.ft).
- Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 15 Nm (11 lb.ft).
- Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 30 Nm (22 lb.ft).
- Stage 2: Tighten the high-pressure fuel supply line union at the fuel rail to 15 Nm (11 lb.ft).
- Stage 4: Tighten the high-pressure fuel supply line union at the fuel rail to 30 Nm (22 lb.ft).
- Secure the clip.



71. NOTE: Remove and discard the blanking caps.

Install the new fuel diverter rail high-pressure supply line.

- Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection pump to 15 Nm (11 lb.ft).
- Stage 2: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 15 Nm (11 lb.ft).
- Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection pump to 30 Nm (22 lb.ft).
- Stage 4: Tighten the high-pressure fuel supply line union at the fuel injection diverter rail to 30 Nm (22 lb.ft).

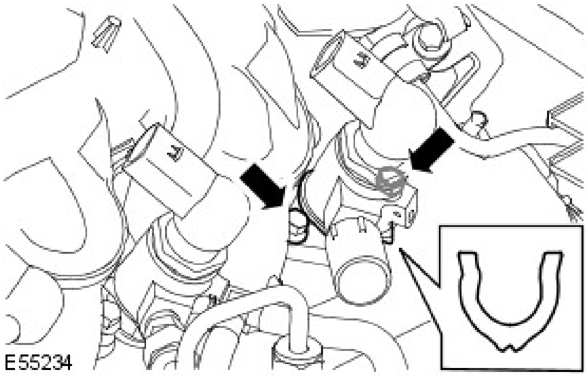
74. CAUTIONS:

⚠ Do not disassemble the fuel injectors or clean the nozzles, even with an ultrasonic cleaner. Always install new fuel injectors when required.

⚠ Do not use tools to install the new fuel return line retaining clip. Failure to follow this instruction will result in damage to the retaining clip.

Install a new fuel injector clamp.

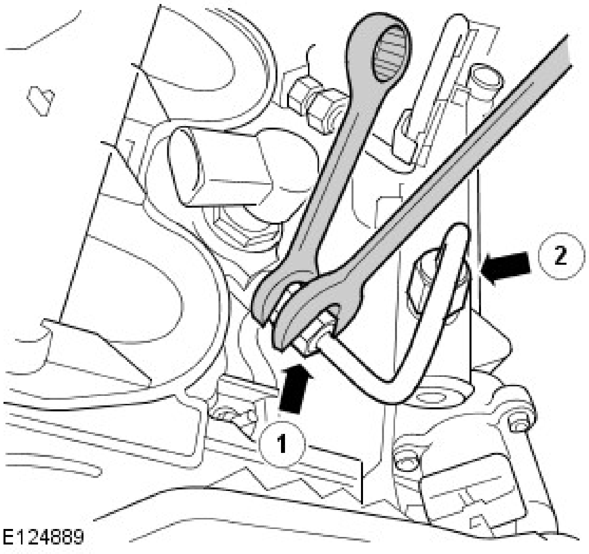
- 1. Install the fuel injector retaining clamp spacer.
- 2. Install a new fuel return line retaining clip.
- 3. Install a new sealing washer.



75. Install the fuel injector.

- Tighten the bolts to 10 Nm (7 lb.ft).

76. Install the remaining fuel injectors.



77. CAUTIONS:

⚠ Do not allow the unions to hit the olive ends of the high-pressure fuel supply line as this may damage the ends of the line and allow foreign matter to enter the fuel injection system.

⚠ Maintain pressure on the high-pressure fuel supply line to keep the olives in contact with the fuel injectors and the fuel rail cones while installing unions.

⚠ Do not use any aggressive cleaning fluid or a wire brush to clean the fluid injector nozzle.

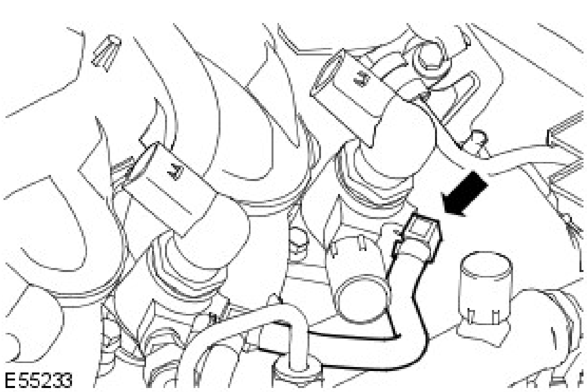
• NOTE: Remove and discard the blanking caps.

Install the new high-pressure fuel injector supply lines.

- Stage 1: Tighten the high-pressure fuel supply line union at the injector to 15 Nm (11 lb.ft).
- Stage 2: Tighten the high-pressure fuel supply line union at the fuel rail to 15 Nm (11 lb.ft).
- Stage 3: Tighten the high-pressure fuel supply line union at the

injector to 30 Nm (22 lb.ft).

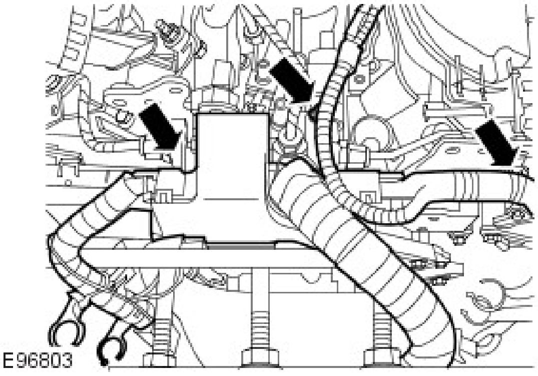
- Stage 4: Tighten the high-pressure fuel supply line union at the fuel rail to 30 Nm (22 lb.ft).



78. ⚠CAUTION: Make sure the fuel return line retaining clip is correctly installed to the fuel injector before installing the return line.

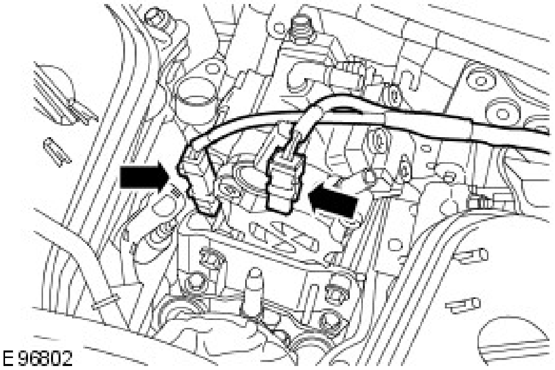
Connect the fuel return line to the fuel injectors.

- Apply a light coating of petroleum jelly to the fuel return line O-ring seals.

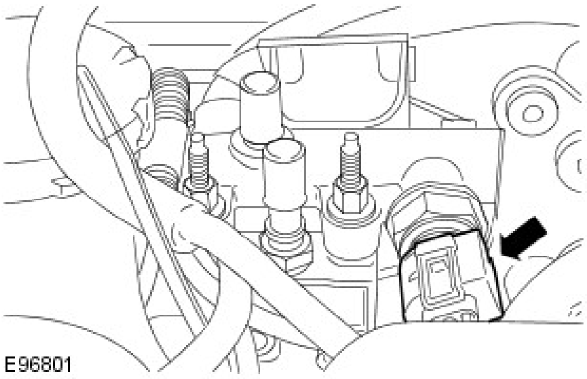


79. Install the engine wiring harness.

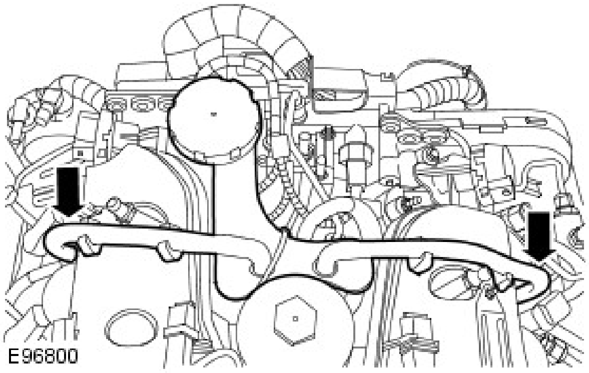
- Tighten the nut to 10 Nm (7 lb.ft).
- Secure the clips.



80. Connect the fuel injection pump electrical connectors.



81. Connect the fuel rail pressure (FRP) sensor electrical connector.



82. Install the crankcase vent oil separator.

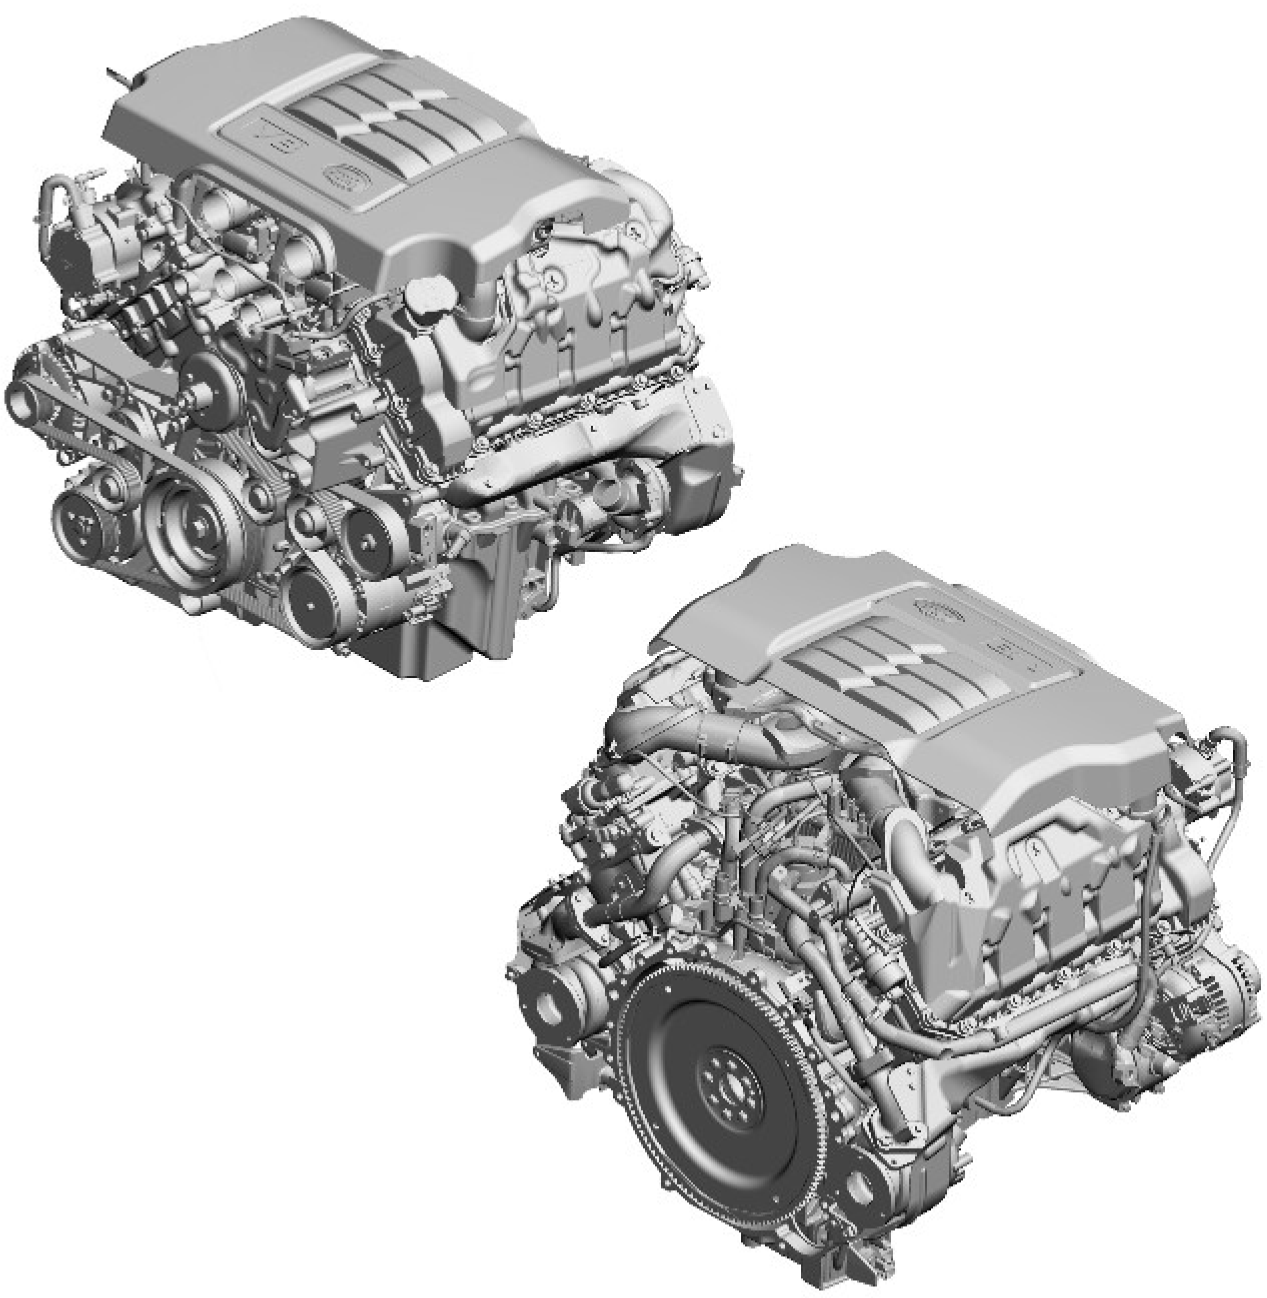
Engine - TDV8 3.6L Diesel - Engine

Description and Operation

EXTERNAL VIEW

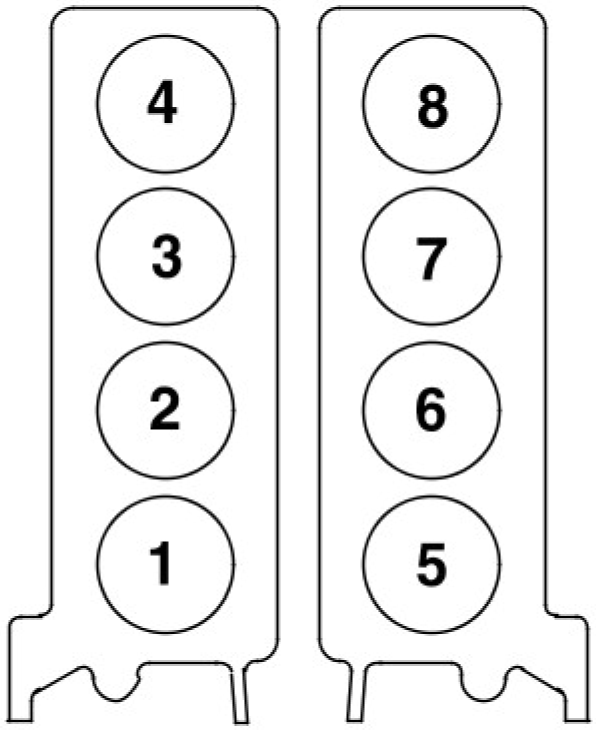


E86595

OVERVIEW

The TdV8 engine is a 3.6 liter, direct injection, 8-cylinder diesel engine having 2 banks of 4 cylinders, arranged at 90 degrees to each other. There are 4 valves per cylinder, which are operated by 2 overhead camshafts per cylinder.

The cylinder are numbered as shown below, with cylinders 1 and 5 at the front to the engine:



E133968

The engine emissions comply with ECD4 (European Commission Directive) legislative requirements and employs 2 catalytic converters systems, electronic engine management control, positive crankcase ventilation and exhaust gas recirculation to limit the emission of pollutants. The unit is water cooled and turbo-charged. The fuel injection system features common rail technology.

The cylinder block is manufactured in Compacted Graphite Iron (CGI) and is coupled with a separate cast aluminium oil pan to provide a lightweight, compact and very stiff bottom end. The cylinder heads are cast aluminium with a moulded plastic camshaft cover. The cast iron exhaust manifolds are unique for each cylinder and a moulded plastic acoustic cover is fitted over the upper engine to reduce engine-generated noise.

Technical Features

- 90 degree 'vee' 8 cylinder engine with a CGI cylinder block
- Plastic cylinder head cover
- Two light, high strength, aluminium cylinder heads
- Four-valve technology with centrally arranged fuel injectors
- Steel roller rockers with hydraulic lash adjusters
- Twin plenum intake system integrated with the camshaft cover
- Twin electronically controlled Variable Geometry Turbochargers (VGT)
- Common rail direct fuel injection system
- High pressure fuel pump
- Gallery cooled pistons with a central crown bowl
- Two electronically controlled Exhaust Gas Recirculation (EGR) valves
- Two EGR coolers
- Exhaust re-treatment by means of a diesel specific oxidation catalytic converter and primary catalytic converter
- Cooling fan with electro-viscous clutch drive

Cylinder Block

The cylinders and crankcase are contained in the closed-deck cylinder block, which is of single cast CGI construction with a hollow beam structure and features fully cross-bolted main bearing journals. With this type of construction less material is required than for a conventional cast iron block, therefore, reducing engine weight and length.

Lubrication oil is distributed through the cylinder block, via the main oil gallery and channels bored in the block, to all critical moving parts. These channels divert oil to the main and big-end bearings via holes machined into the crankshaft.

A single connection at the Right Hand (RH) rear of the oil filter and oil/fuel cooler assembly connects a pipe to each of the turbochargers via a T-piece connector. Oil is supplied, under pressure via this connection, from the oil pump to provide lubrication for the turbochargers bearings.

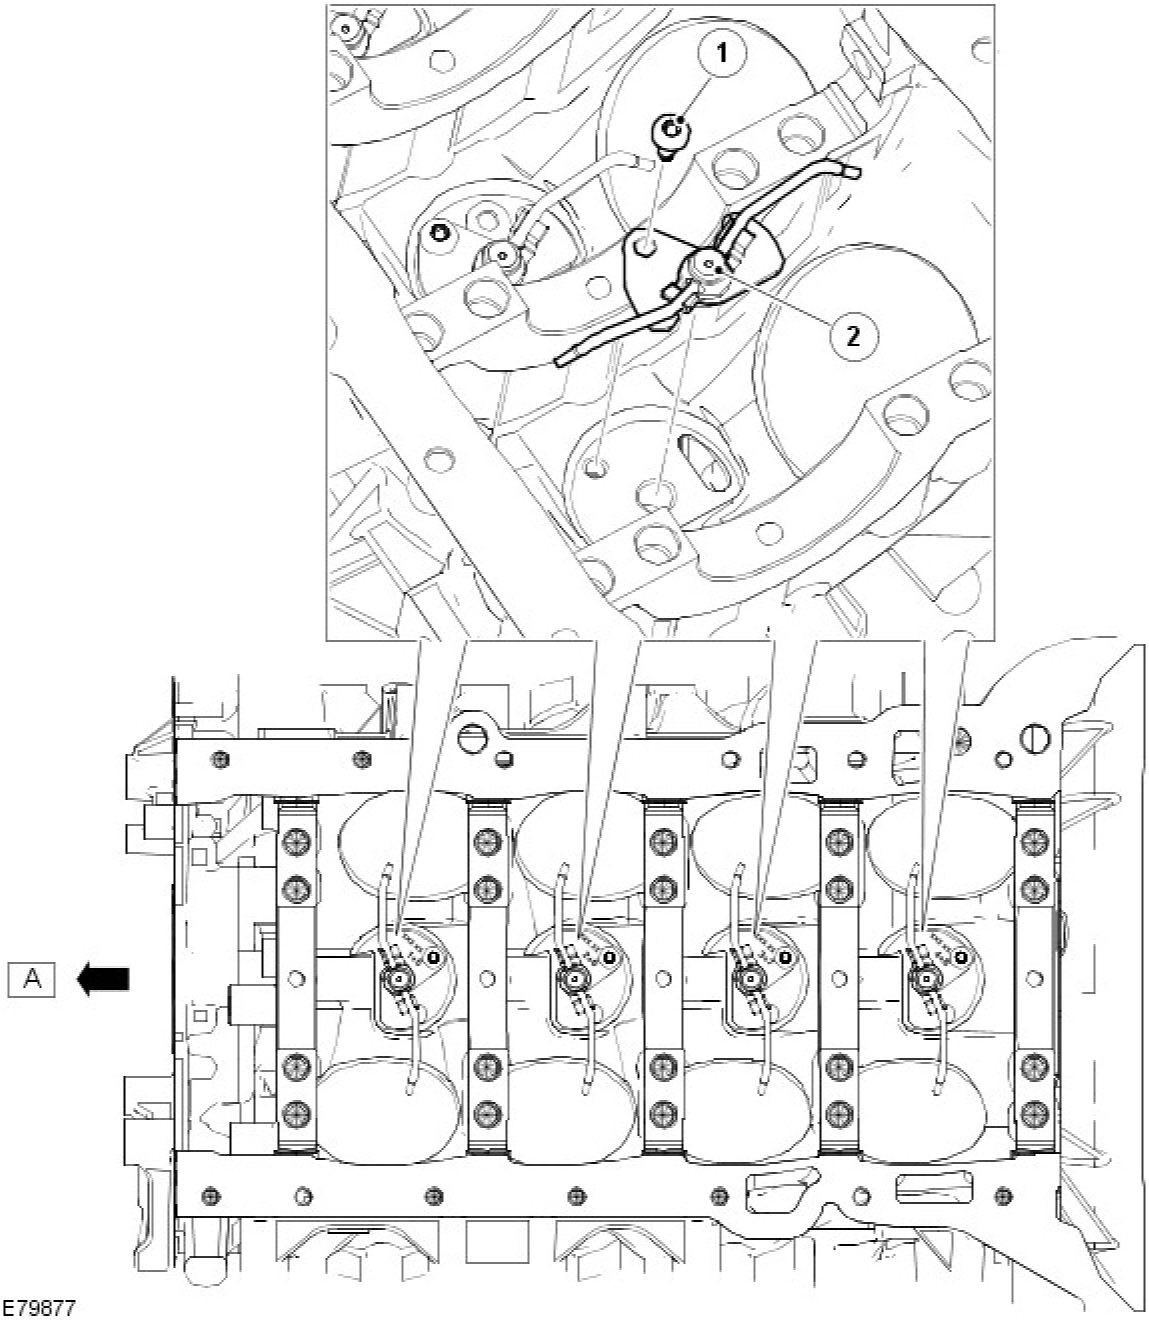
Cylinder cooling is achieved by coolant circulating through chambers in the cylinder block casting.

Two hollow metal dowels are used to locate the cylinder heads to the cylinder block, one on each side at the rear of the unit.

A port is included at the rear RH and Left Hand (LH) side of the oil pan, below the turbochargers, to connect the turbochargers oil return pipes to a dedicated oil pan within the main oil pan (see 'Turbocharger Oil Return' section for more information).

A plug sealing the lubrication cross-drilling gallery is located at the front RH side of the cylinder block. Plugs for the main lubrication gallery are included at the front and rear of the cylinder block.

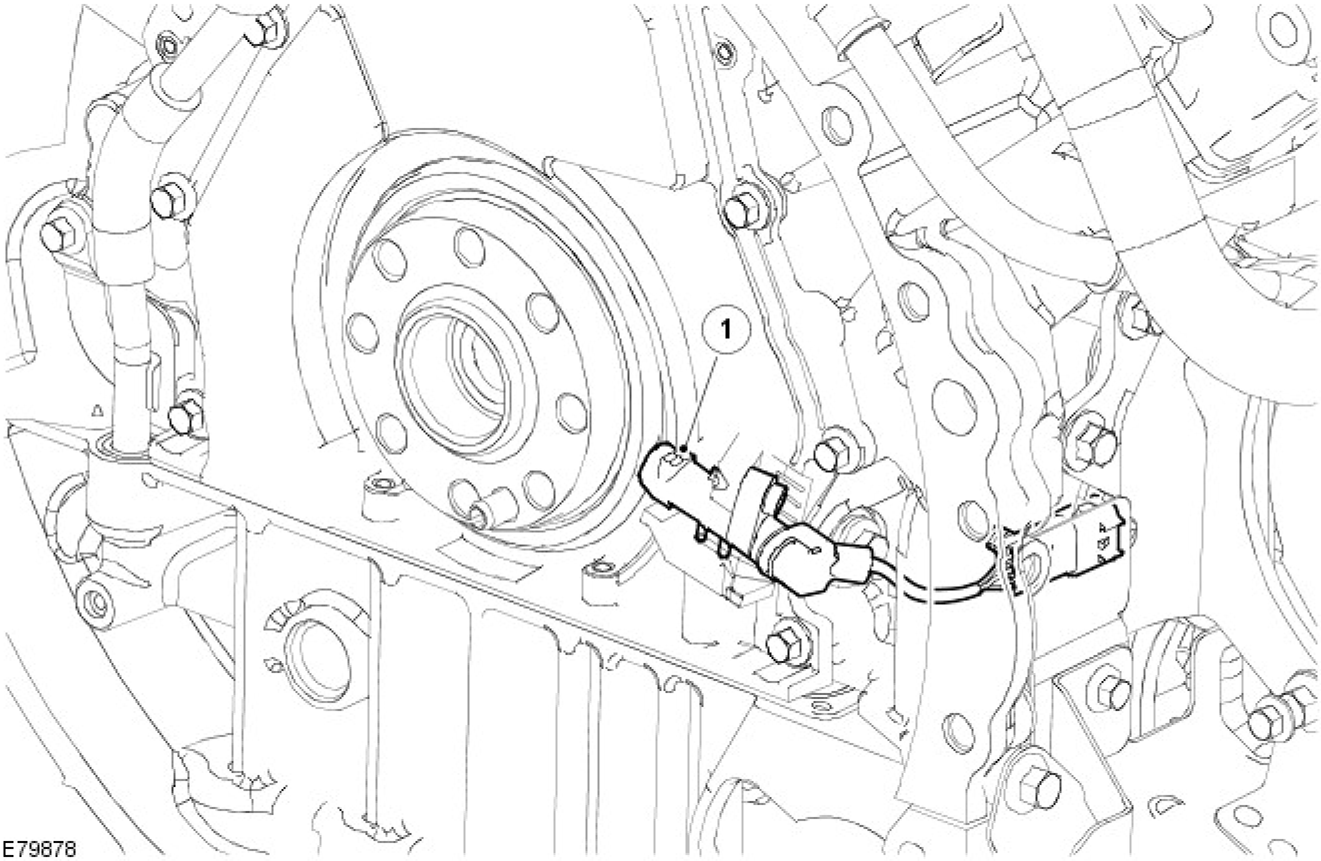
Piston Cooling Jets



Item	Part Number	Description
A	-	Front of engine
1	-	Bolt
2	-	Piston cooling jet

Jets located in the cylinder block provide piston and gudgeon pin lubrication and cooling. These jets spray oil on to the inside of the piston. The oil then flows through 2 internal wave shaped channels to help cool each piston crown.

Crankshaft Position (CKP) Sensor

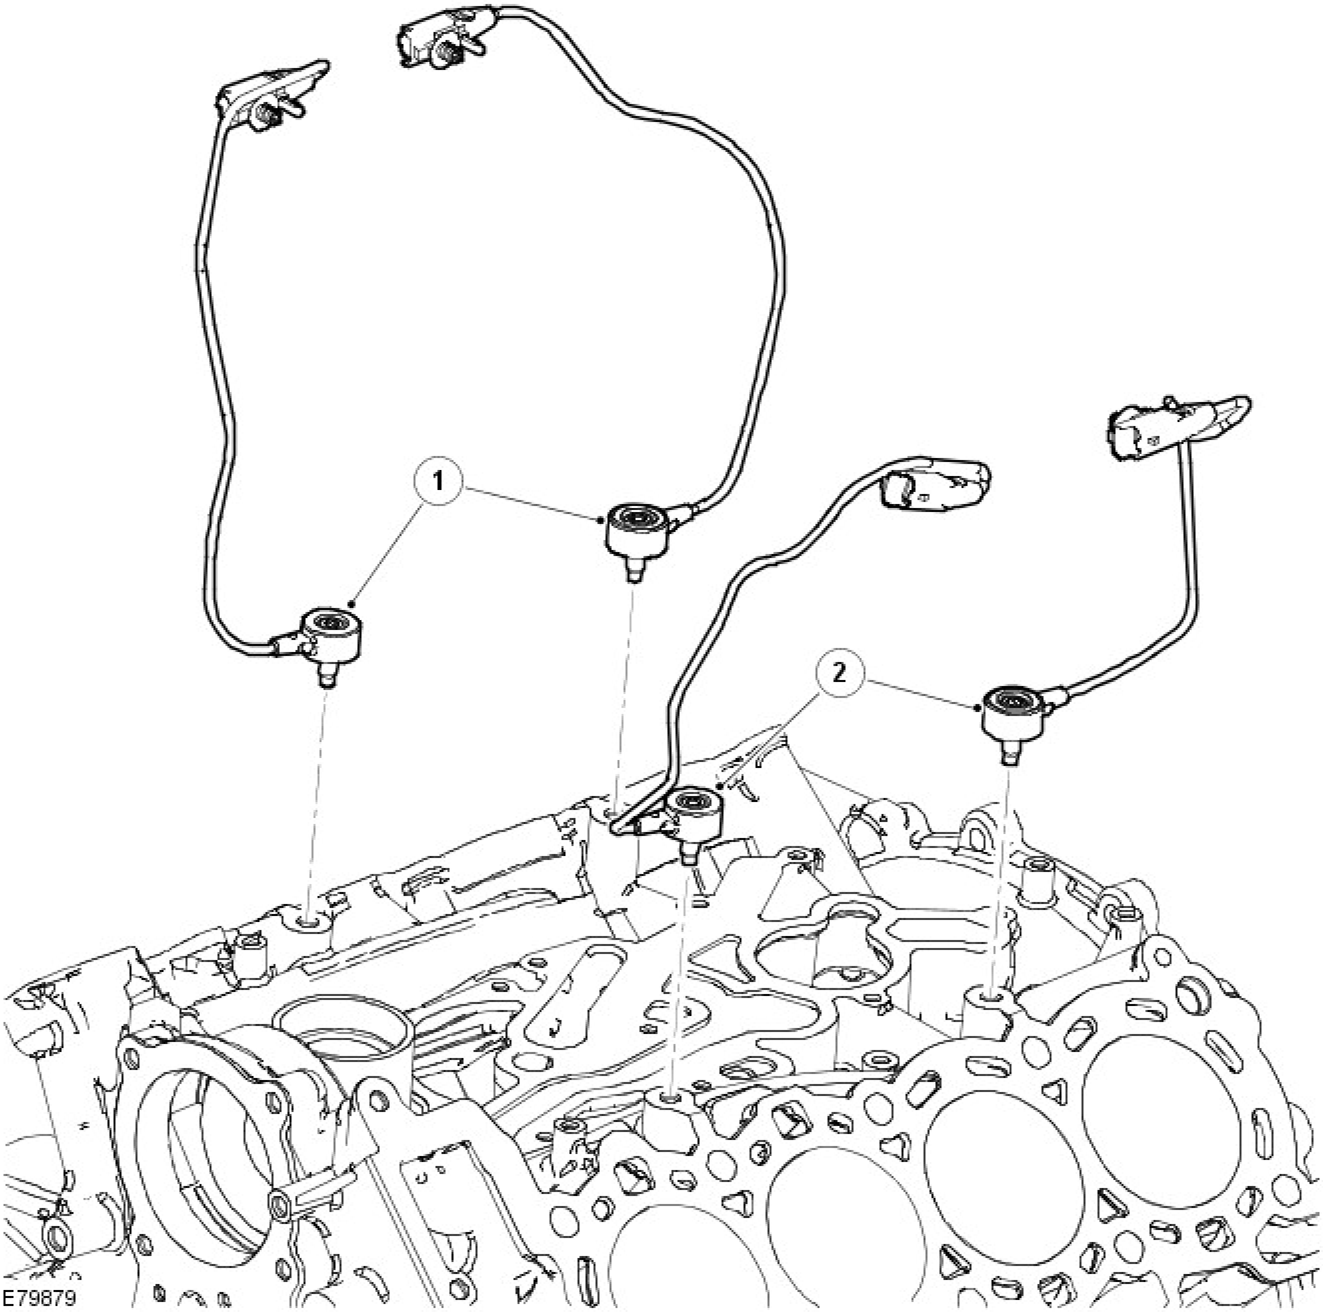


Item	Part Number	Description
1	-	Crankshaft Position (CKP) sensor

The Crankshaft Position (CKP) sensor is located at the rear of the crankshaft, behind the flywheel in the LH side of the rear oil seal retainer. The sensor provides an input of engine crankshaft speed and position. The sensor works on the Hall effect principle and scans a trigger wheel (magnetic disc) on the crankshaft. An air gap of 0.4 to 1.5mm, between the trigger wheel and the CKP sensor, is achieved by the positional mounting of the sensor.

For additional information, refer to: Electronic Engine Controls (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Description and Operation).

Knock Sensors



Item	Part Number	Description
1	-	RH knock sensors
2	-	LH knock sensors

Four knock sensors are located on the cylinder block between the 'vee' of each cylinder. The knock sensors produce a voltage signal in proportion to the amount of mechanical vibration generated at each ignition point. Each sensor monitors 2 cylinders in the related cylinder bank.

The signals are supplied to the Engine Control Module (ECM), which compares them with mapped signals stored in it's memory. From this, the ECM can determine when detonation occurs on individual cylinders.
For additional information, refer to: Electronic Engine Controls (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Description and Operation).

Starter Motor

The engine starter motor is installed at the rear RH side of the oil pan, at the cylinder block to oil pan split line.
For additional information, refer to: Starting System (303-06D Starting System - TDV8 3.6L Diesel, Description and Operation).

Coolant Drain Plug

Two coolant drain plugs are installed in the cylinder block, 1 is fitted in the rear RH side, and the other is fitted in the middle of the cylinder block on the LH side.

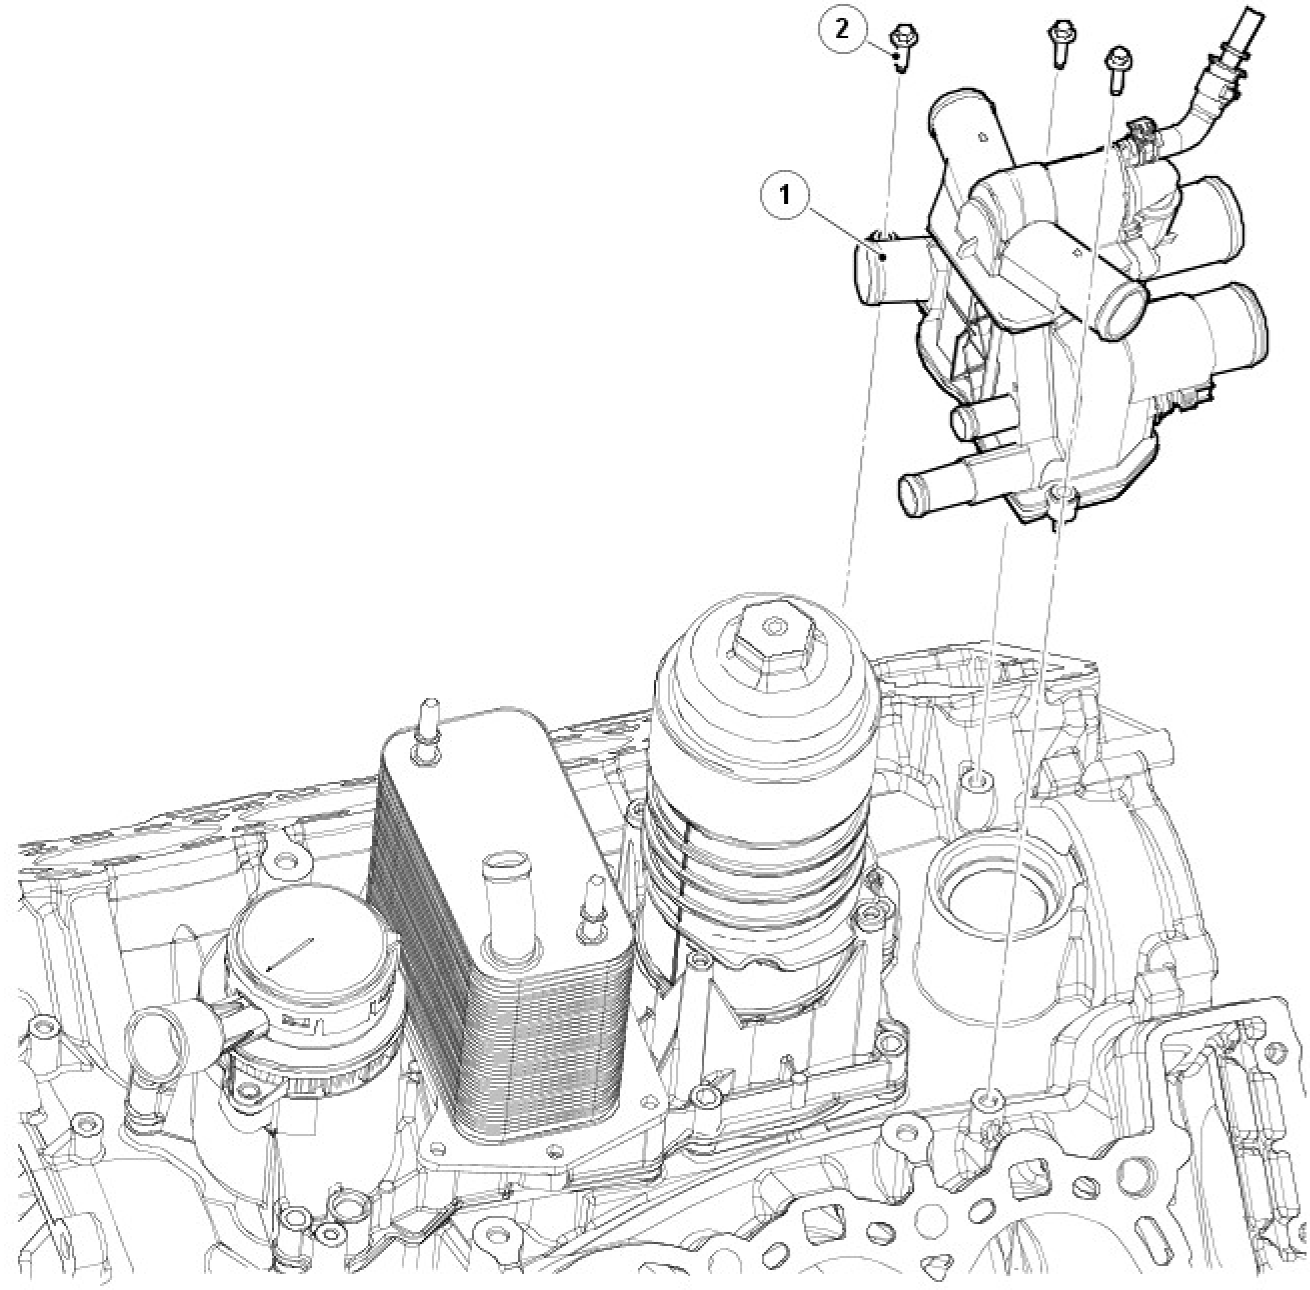
1	-	Bolt (4 off)
2	-	Coolant pump
3	-	'O' ring seal
4	-	Cylinder block

The coolant pump is installed on center of the cylinder block front face and is secured and sealed using 4 bolts and an 'O' ring. A poly-vee belt drives the coolant pump via the crankshaft.

Oil Filter and Oil/Fuel Cooler Assembly

The oil filter and oil/fuel cooler assembly is located on the top of the cylinder block in the centre of the 'vee'. The oil filter is a replaceable cartridge installed on an adapter. For more information refer to the lubrication section.

Thermostat Assembly



E79881

Item	Part Number	Description
1	-	Thermostat assembly
2	-	Bolt (3 off)

The thermostat assembly connects the cooling channels of the cylinder block to the cooling channels of the LH and RH cylinder heads and provides the coolant outlet for the EGR and coolant return.

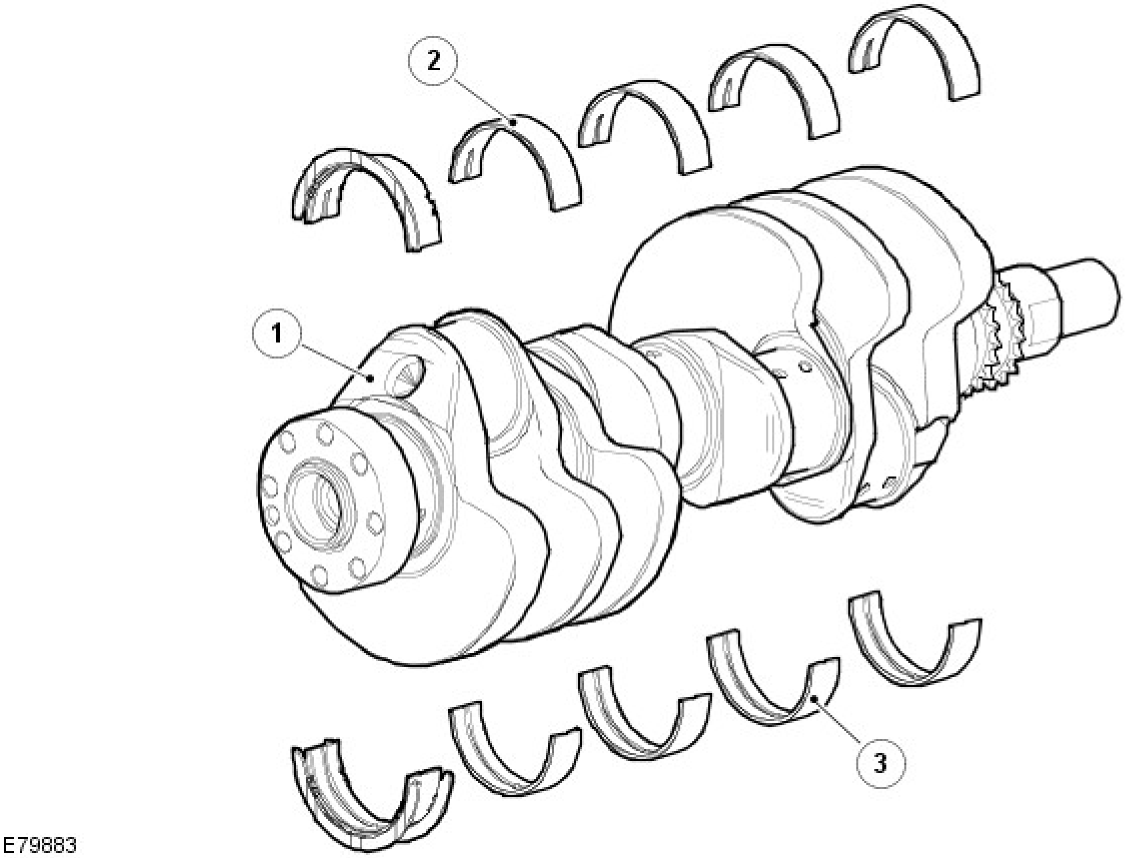
Crankshaft and Main Bearings



Item	Part Number	Description
1	-	Crankshaft
2	-	Main bearing shell - lower (5 off)

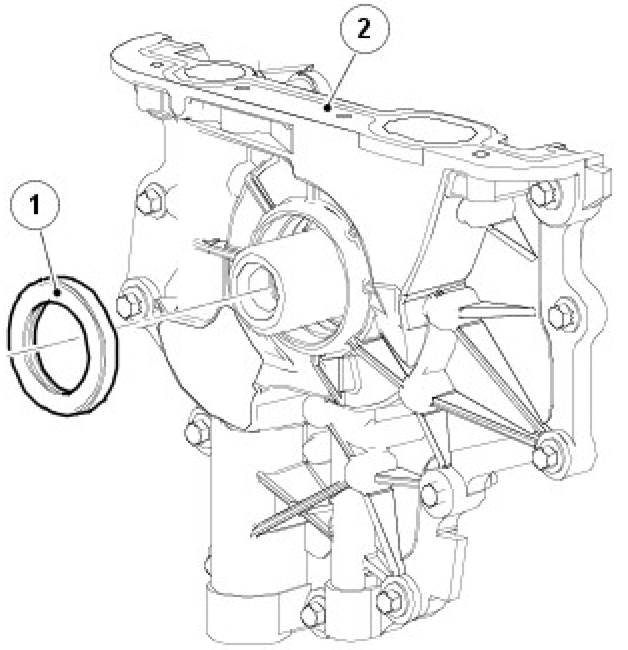
3	-	Main bearing shell - upper (5 off)

The crankshaft is forged steel and undercut rolled with induction hardened journals, which run in 5 main bearings.

The main bearing caps are double and cross-bolted, this adds to the strength and rigidity of the engine block.

The crankshaft drive pulley is not keyed onto the crankshaft; it is secured to the crankshaft by a single bolt.

The main bearings are aluminium/tin split plain selective bearings. An oil groove in the top half of each bearing transfers oil into the crankshaft for lubrication of the connecting rod bearings. The upper and lower shells of bearing number 5 contain integral thrust washers, which limits the crankshaft end float.

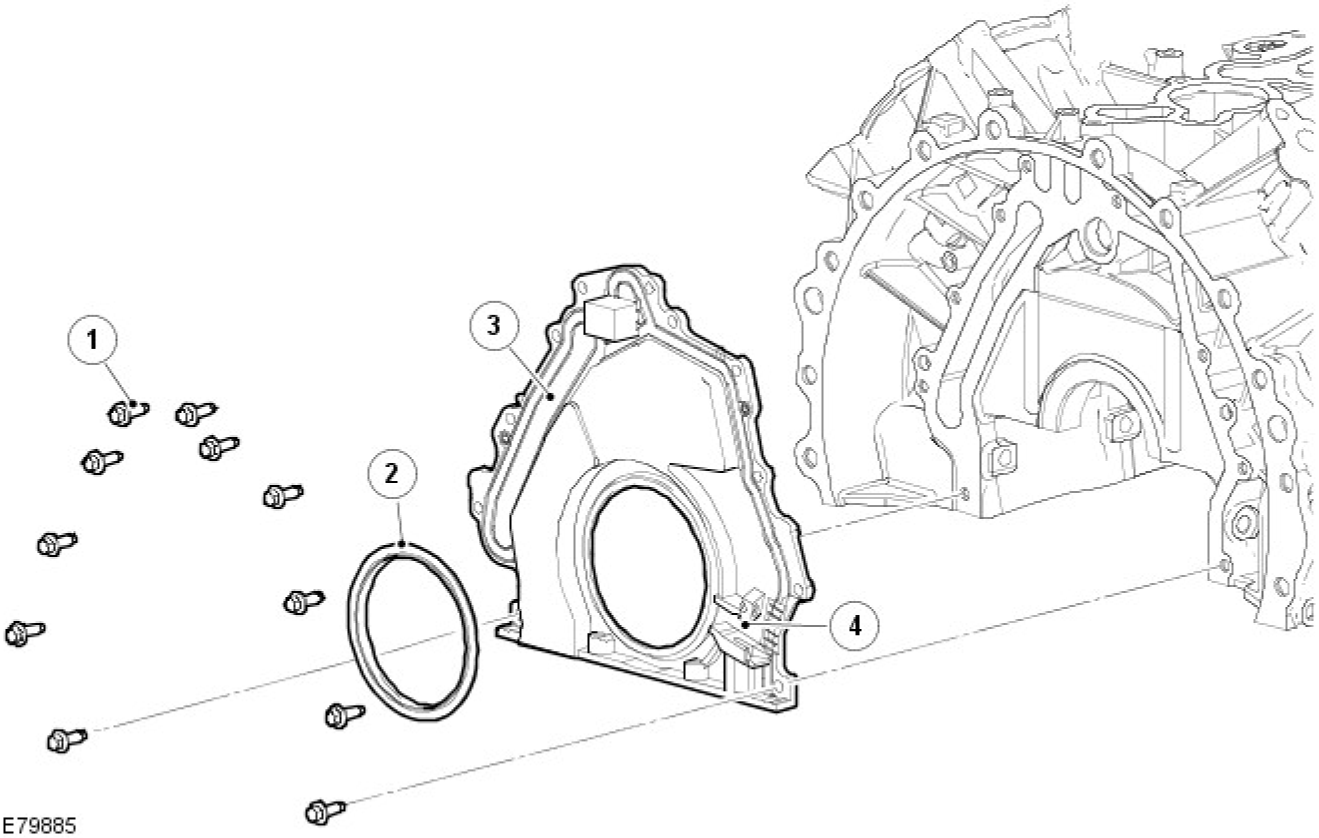


E79884

Item	Part Number	Description
1	-	Crankshaft front oil seal
2	-	Oil pump

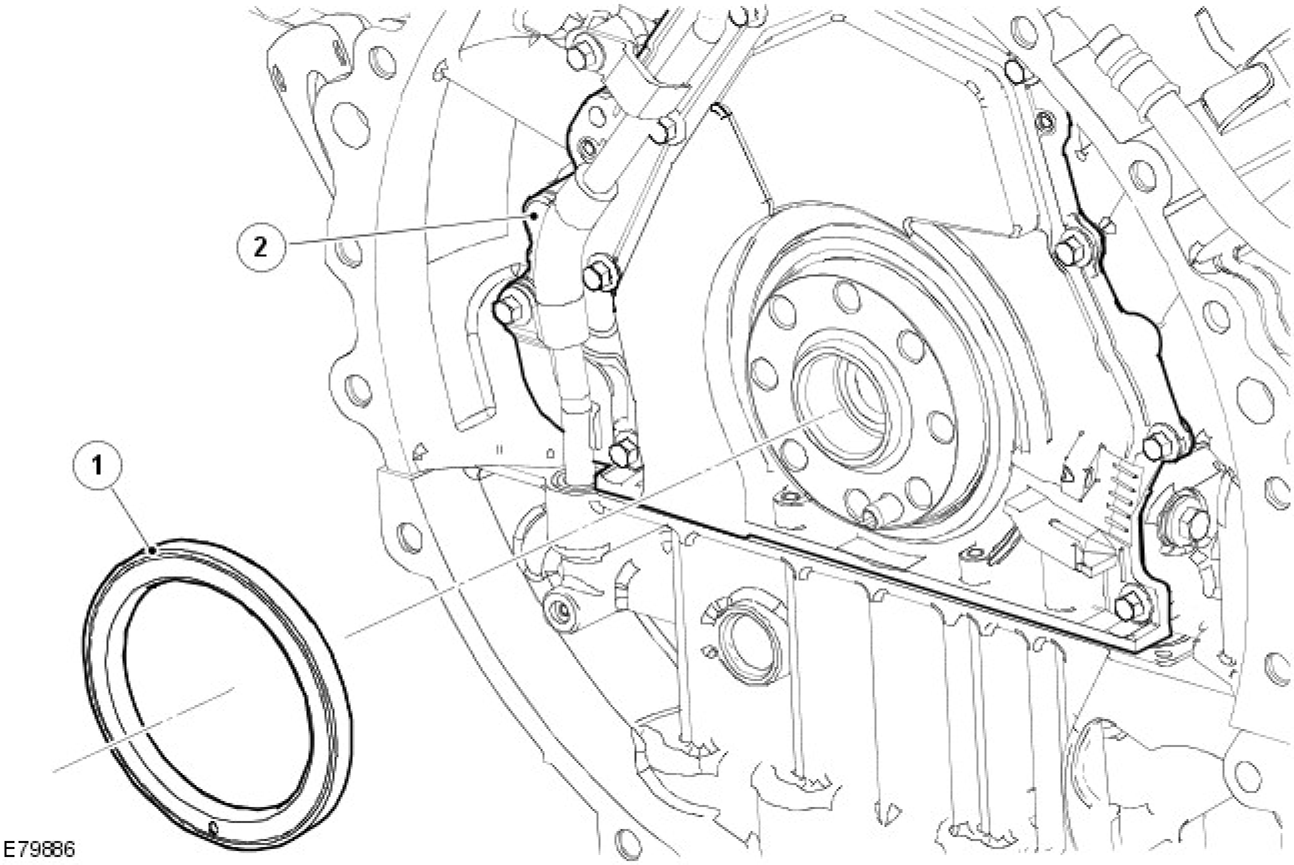
The crankshaft front oil seal is a press fit into the oil pump housing and requires a special tool for fitment.

• NOTE: The seal must be inserted such that it's front face is 1mm underflush with the machined front face of the oil pump. It must not be pushed all the way into the bore as this will block the seal drains.



Item	Part Number	Description
1	-	Bolt (11 off)
2	-	Crankshaft rear oil seal
3	-	Rear oil seal retainer
4	-	CKP retainer

The crankshaft rear oil seal is a press fit in the rear oil seal retainer. The rear oil seal retainer also houses the CKP sensor.



Item	Part Number	Description
1	-	CKP sensor trigger wheel
2	-	Rear oil seal retainer

The trigger wheel is located on the rear of the crankshaft. It is pressed onto the crankshaft using a special tool, which also precisely aligns the trigger wheel for crankshaft position and timing. The trigger wheel consists of 60 magnets, minus 2 for ECM crankshaft position reference and synchronisation. The magnets cannot be seen on the trigger-wheel; therefore, it can only be positioned using the special tool.
For additional information, refer to: Electronic Engine Controls (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Description and Operation).

- NOTE: If the trigger wheel is removed for any reason, a new trigger wheel must be fitted. Do not reuse the old trigger wheel.

The CKP sensor air gap is not adjustable. The sensor bolts into the rear oil seal retainer and the tolerance on the retainer and sensor give an air gap within the specified range.

Connecting Rods and Pistons

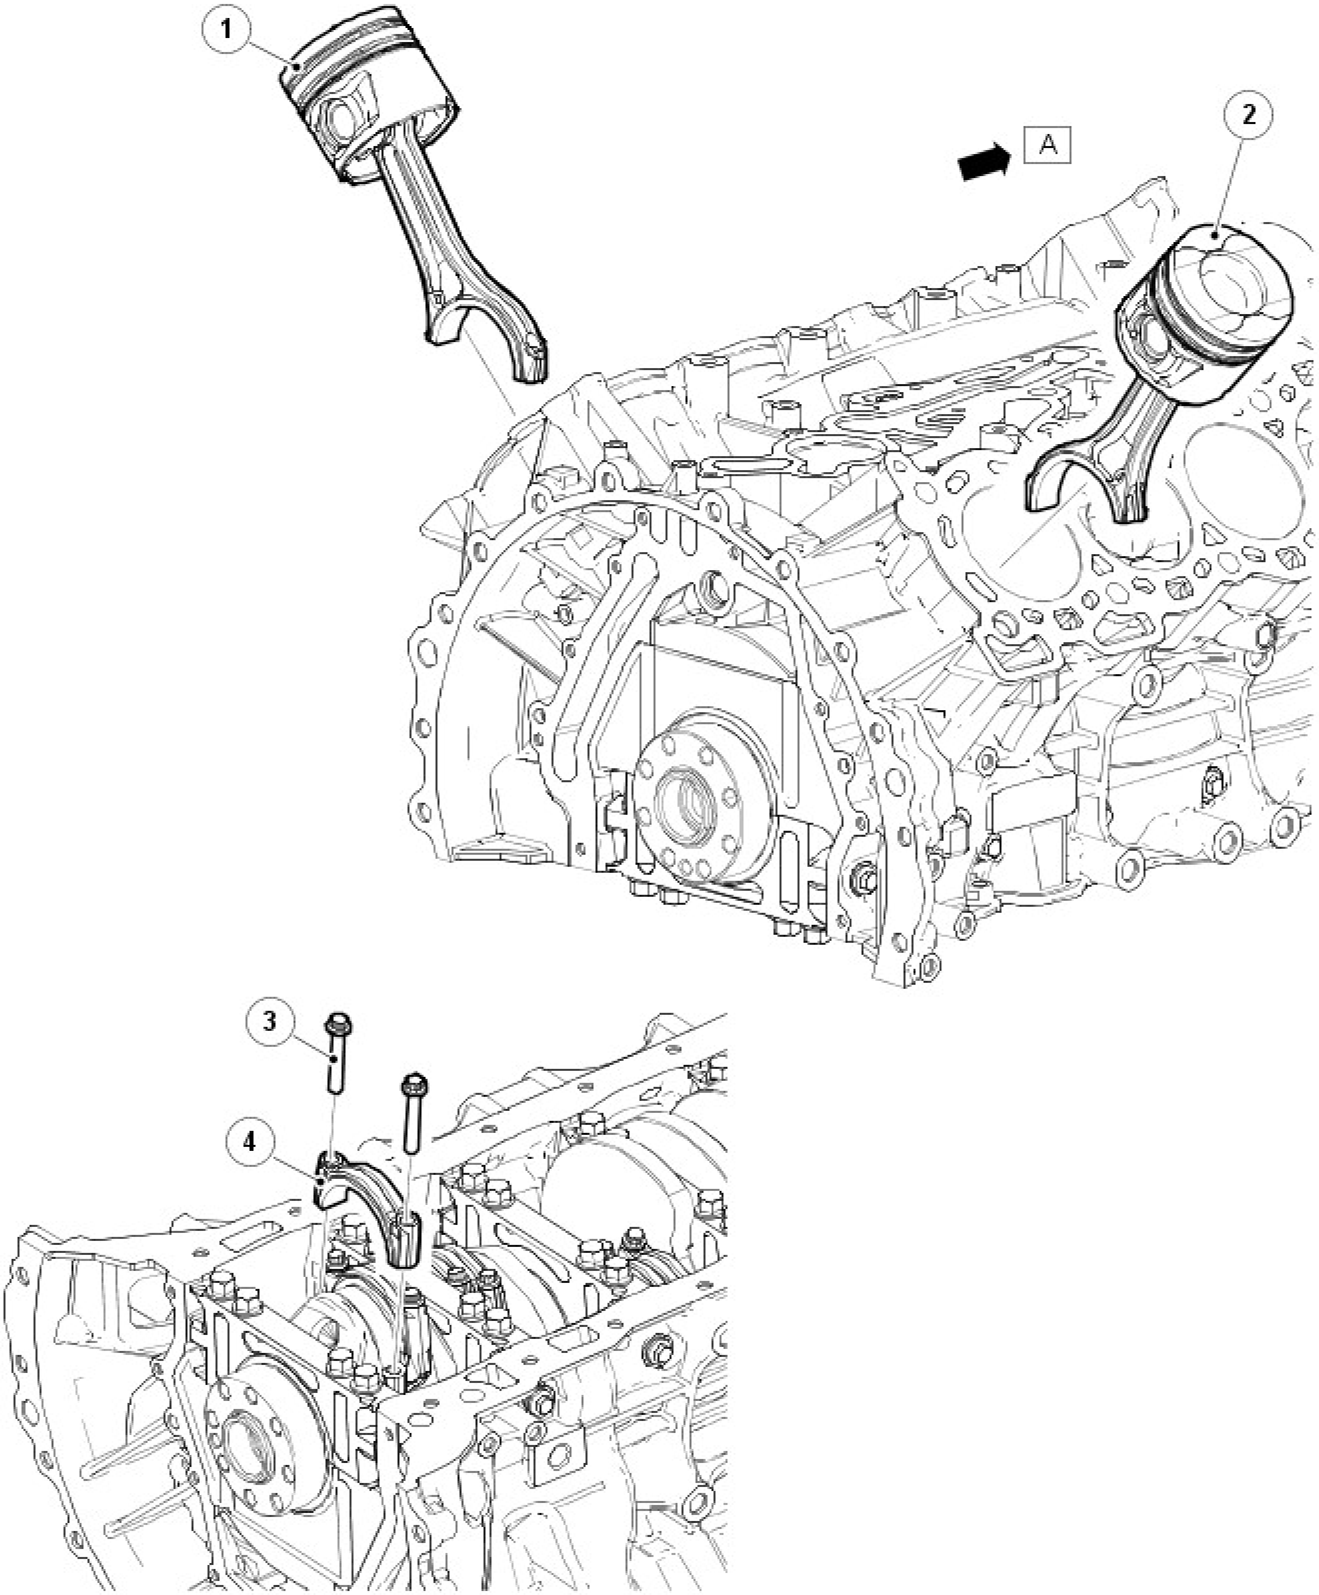
6	-	Connecting rod bearing cap
7	-	Bolt (2 off)
8	-	Connecting rod bearing (lower)
9	-	Connecting rod bearing (upper)

The connecting rods are manufactured from sinter-forged steel and have fracture-split bearing caps. Fracturing the opposing sides of the connecting rod at the bearing horizontal centerline produces the bearing caps. As well as being easier to manufacture, when reassembled the fractured surfaces interlock to form a strong seamless joint. The cylinder position is etched on adjoining sides of the joint to identify matching connecting rods and bearing caps. The selective connecting rod bearings are aluminium/tin split plain bearings. The connecting rod bearing is 'Bismuth coated' (Bismuth exhibits the greatest opposition to being magnetised and has one of the lowest thermal conductivity of all metals).

- NOTE: The connecting rods are not selective.



E79888

Item	Part Number	Description
A	-	Front of engine
1	-	Piston and connecting rod assembly, cylinders 5-8
2	-	Piston and connecting rod assembly, cylinders 1-4

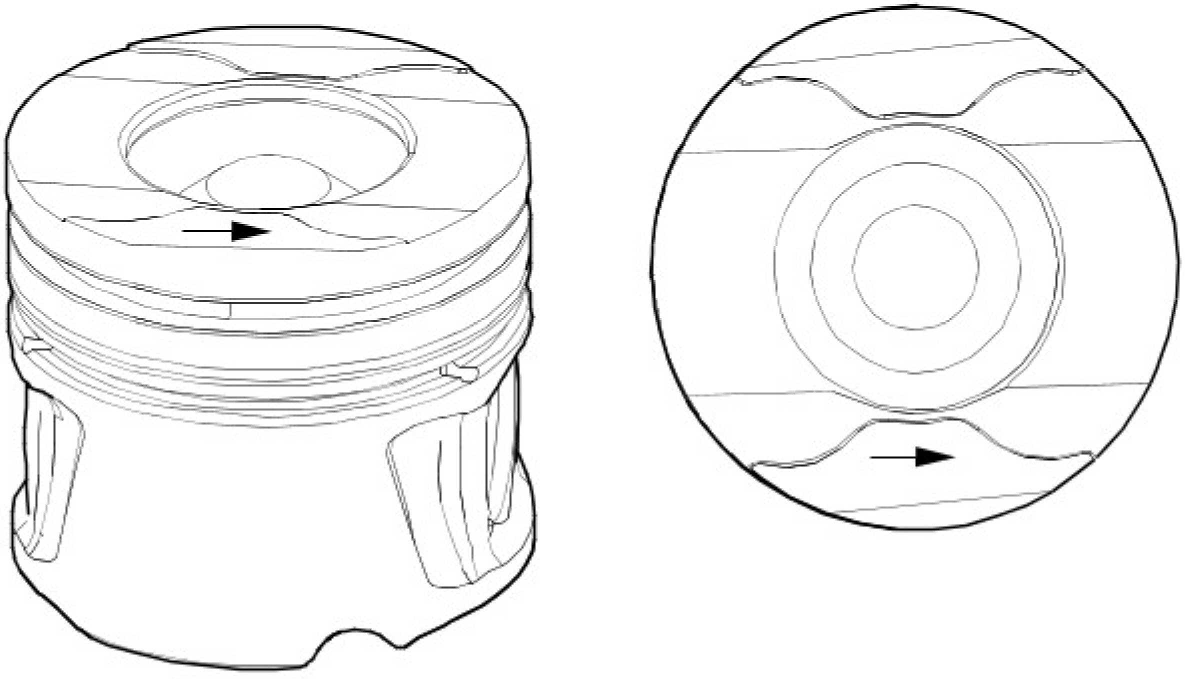
3	-	Bolt (16 off)
4	-	Connecting rod bearing cap

When installing a connecting rod, ensure the back of the connecting rod faces the center of the 'vee'.

The pistons are made from aluminium alloy and are fitted with 2 compression rings and an oil control ring. The piston crown incorporates a pronounced bowl; this forms the combustion chamber, which promotes swirl and turbulence necessary for good combustion and improved emissions. In addition, the piston skirt has a molybdenum-coated surface, which counteracts scoring of the cylinder bore and piston.

The piston also incorporates a double wave gallery within the piston crown to enhance piston cooling. The pistons are supplied oil by means of spray jets located in the cylinder block oil gallery. These jets ensure optimum piston cooling to counteract the high temperatures generated by the combustion process.

Each piston is installed on a wrist pin located in an aluminium/tin bushing in the connecting rod.



E79889

When installing pistons ensure the arrows on the piston crowns all point to the front of the engine.

- NOTE: All pistons are common single grade/single part number.

The piston top ring is a taper type and is fitted with the taper to the top of the piston. All rings marked 'top' are assembled with 'top' uppermost. All rings must be spaced evenly around the piston before installing. The circumference gap of the double bevelled oil control ring must be opposite the spiral control joint.

Oil Pan

1	-	Engine oil drain plug
2	-	Oil temperature sensor
3	-	Bolt (4 off)
4	-	Bolt (3 off)
5	-	Bolt (15 off)
6	-	Cylinder block
7	-	Oil pan

The cast aluminium oil pan is heavily ribbed for strength and stiffness and supports the front differential. The engine oil drain plug and oil temperature sensor are located on the underside of the oil pan, towards the rear. An oil baffle plate is incorporated in the oil pan to reduce oil foaming and slosh.

A gasket seals the joint between the oil pan and the cylinder block.

Oil Temperature Sensor

The engine oil temperature sensor, located in the oil pan, provides the ECM and the instrument cluster with the engine oil temperature status.

The sensor circuit consists of an internal voltage divider circuit, which incorporates a Negative Temperature Coefficient (NTC) thermistor. The output from the sensor is the change in voltage, as the thermistor allows more current to pass to ground relative to the temperature of the oil.

For additional information, refer to: Electronic Engine Controls (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Description and Operation).

Drive is provided by 2 simplex bush timing chains, driven from the crankshaft to the inlet camshaft gears of each cylinder head.

Each exhaust camshaft is driven by a gearwheel arrangement from the intake camshaft.

Each timing chain is contained between 1 fixed and 1 hydraulically adjustable chain guide. The adjustable guides are of aluminium die casting construction with clip-fastened plastic slide linings. The fixed guides are moulded plastic. The adjustable guides are attached to the front of the cylinder block using pivot bolts, which allows it to pivot about its axis. A single tensioner provides hydraulic tension for the chains, 1 located in each cylinder head (for more information, see cylinder head section). The lateral movement in the adjustable guides causes the timing chain to tension and consequently, compensation for chain flutter and timing chain wear is automatically controlled.

The timing chains are oil splash lubricated, via the oil pump and chain tensioner. Oil spray is directed to the chain from several oil supply ports in the front of the cylinder block and cylinder head.

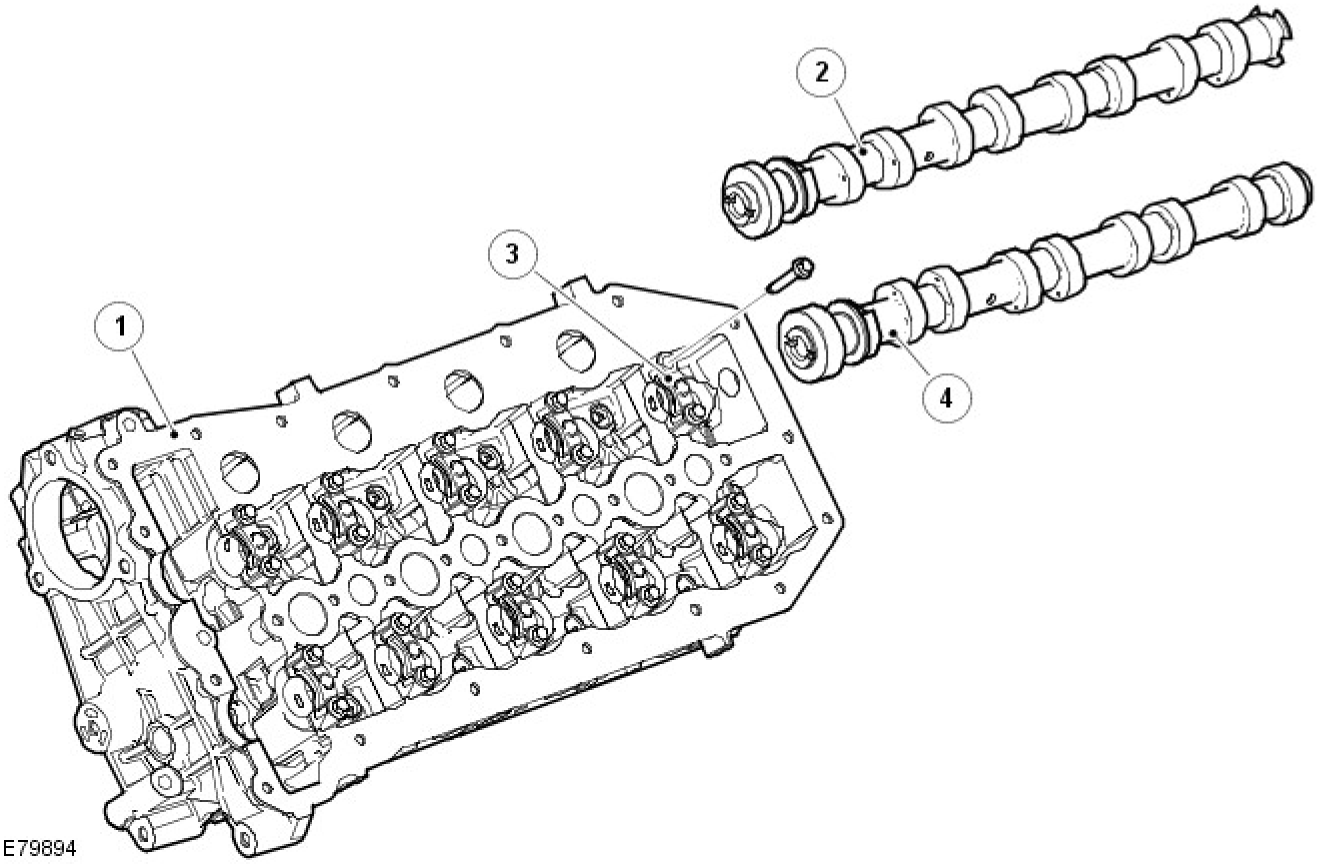
Cylinder Heads



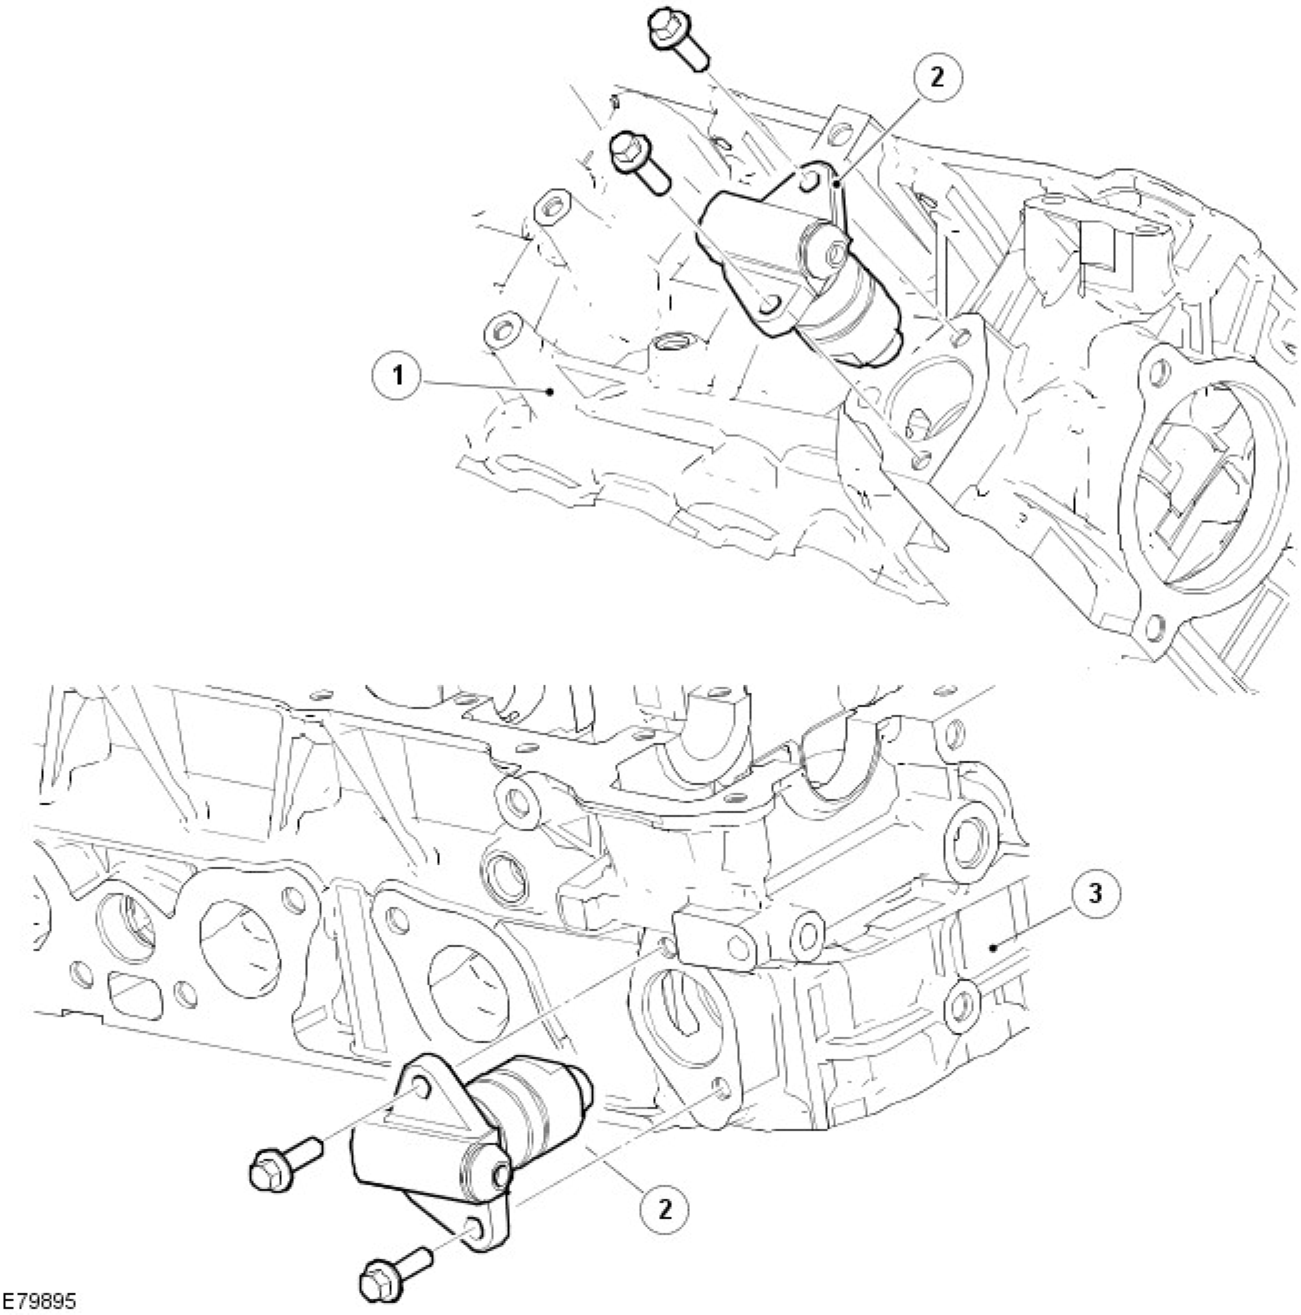
Item	Part Number	Description
1	-	Cylinder head (LH shown, RH similar)
2	-	Intake camshaft
3	-	Camshaft bearing cap (5 off per camshaft)
4	-	Exhaust camshaft

The aluminium gravity die-cast cylinder heads are unique to each cylinder. Ten deep-seated bolts help reduce distortion and secure each cylinder head to the cylinder block. The cylinder head bolts are located beneath the camshafts, 5 under the inlet camshaft and 5 under the exhaust camshaft. Two hollow dowels align each cylinder head with the cylinder block.

- NOTE: The cylinder head bolts are not accessible with the camshafts fitted.

- NOTE: The cylinder head cannot be reworked.

Each cylinder head has 4 ports machined at each cylinder location, 2 exhaust ports and 2 inlet ports. One of the inlet ports is helical and functions as a swirl port, the other is arranged laterally as a tangential port and functions as a charge port.



Item	Part Number	Description
1	-	LH cylinder head
2	-	Hydraulic chain tensioner (2 off)
3	-	RH cylinder head

Each cylinder head houses an automatic chain tensioner, which contains a hydraulically operated plunger that operates on the adjustable guides at the slack side of each of the timing chains. Pressurised oil for the adjuster is supplied through the back of the unit from an oil supply port in each cylinder head.

Camshafts

There is 1 exhaust camshaft and 1 intake camshaft per cylinder head. Each of the overhead camshafts are located in 5 bearings and maintained in position by 5 aluminium alloy bearing caps. Each of the bearing caps are fixed to the cylinder head by 2 bolts. Location letters and numbers are etched on the caps for each cylinder head, A to L for the LH head and 0 to 9 for the RH head. The camshafts are of a hollow steel tube construction, with pressed on steel lobes. The camshafts are driven from the crankshaft via simplex chains and a sprocket arrangement.

- NOTE: Both the LH and RH inlet camshafts utilize LH threads to locate the timing gears.

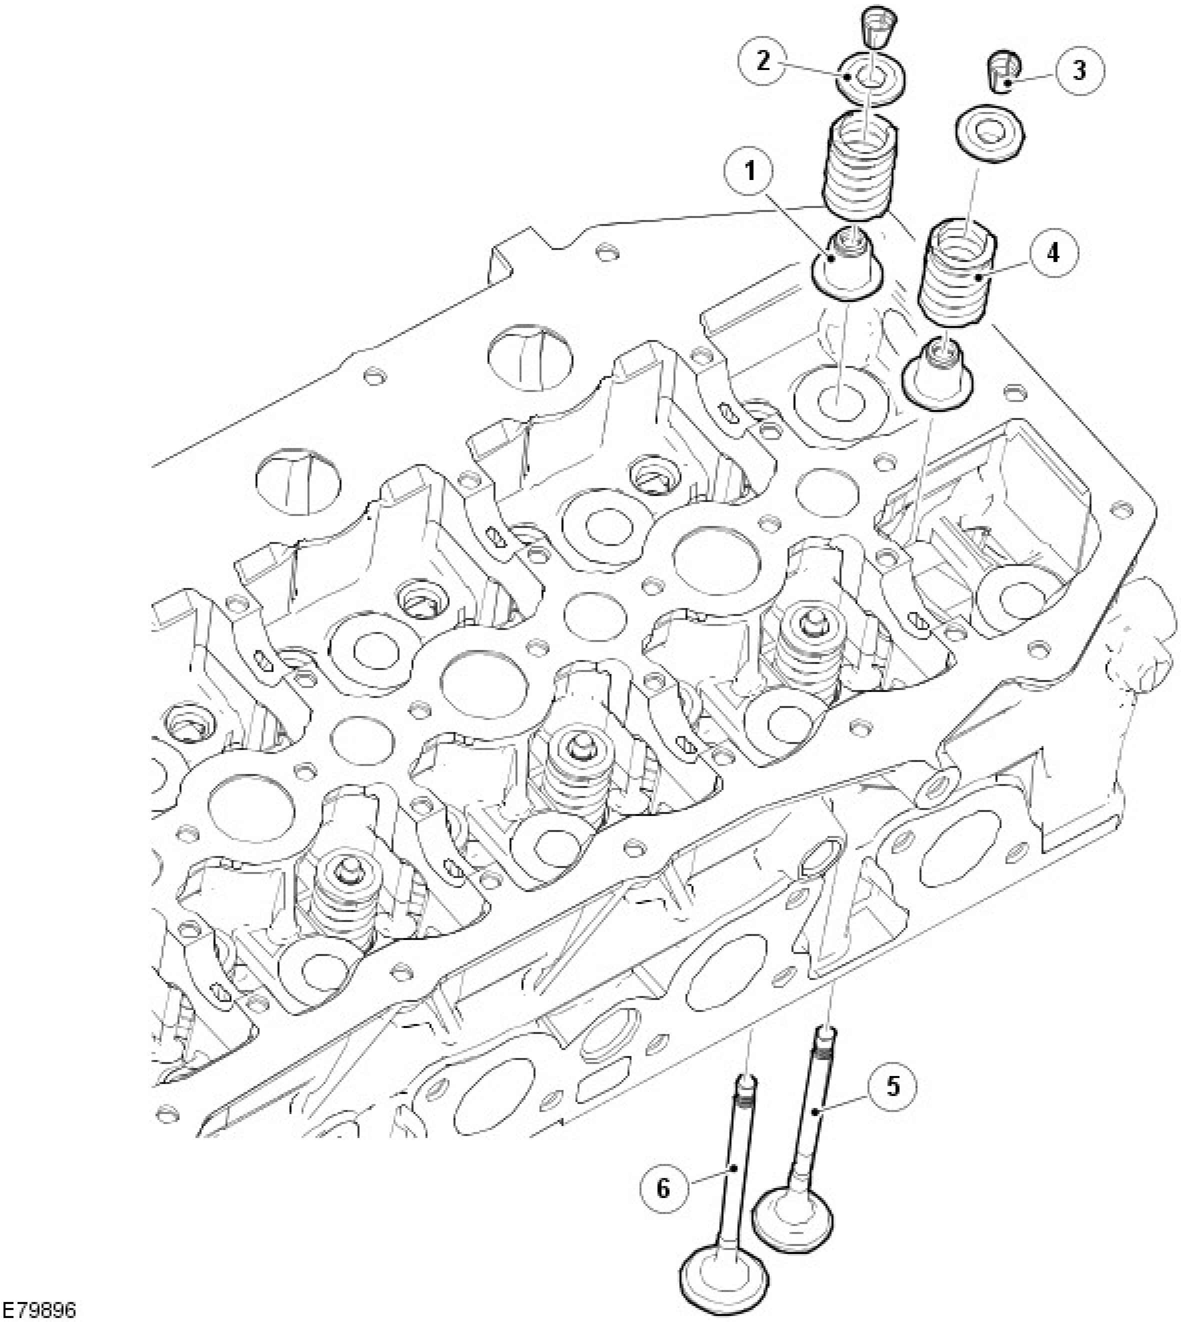
Each camshaft has 8 machined lobes for operating the inlet and exhaust valves through hydraulic lash adjusters and roller-type finger levers. The front of the RH cylinder head inlet camshaft provides a drive connection for the vacuum pump, via a drive gear. The front of the LH cylinder head inlet camshaft provides a drive connection for the high-pressure fuel pump, also via a drive gear.

The following table lists some unique features for each camshaft to avoid placement of camshafts in the wrong position:

Camshaft Identification Table

Camshaft	Identification
Intake - RH	LH thread for camshaft gear attachment Longest camshaft
Exhaust - RH	RH thread for camshaft gear attachment. Cannot accommodate both sprocket and gear
Intake - LH	LH thread for camshaft gear attachment Trigger wheel for CMP sensor Camshaft diameter will not allow it to be fitted in the RH head
Exhaust - LH	RH thread for camshaft gear attachment Cannot accomodate both sprocket and gear

Inlet and Exhaust Valves



Item	Part Number	Description
1	-	Valve spring stem seal (32 off per head)
2	-	Valve spring retainer (32 off per head)
3	-	Valve spring collet (32 off per head)
4	-	Valve spring (32 off per head)
5	-	Exhaust valve (16 off per head)
6	-	Inlet valve (16 off per head)

Two 27.5 mm inlet valves and 2 25.0 mm exhaust valves serve each cylinder. Each valve is of a ground, solid one-piece head construction and the stems are made from a Nimonic alloy material.

The valve springs are made from spring steel and are of the parallel single-coil type. The bottom end of each spring rests on the flange of a spring retainer, which has an integral valve stem seal. The top end of the spring is held in place by a spring retainer, which is held in position at the top end of the valve stem by split taper collets. The taper collets have grooves on the internal bore that locate to grooves ground into the upper stems of the valves.

The powder metal valve seats and guides are an interference fit in the cylinder head.

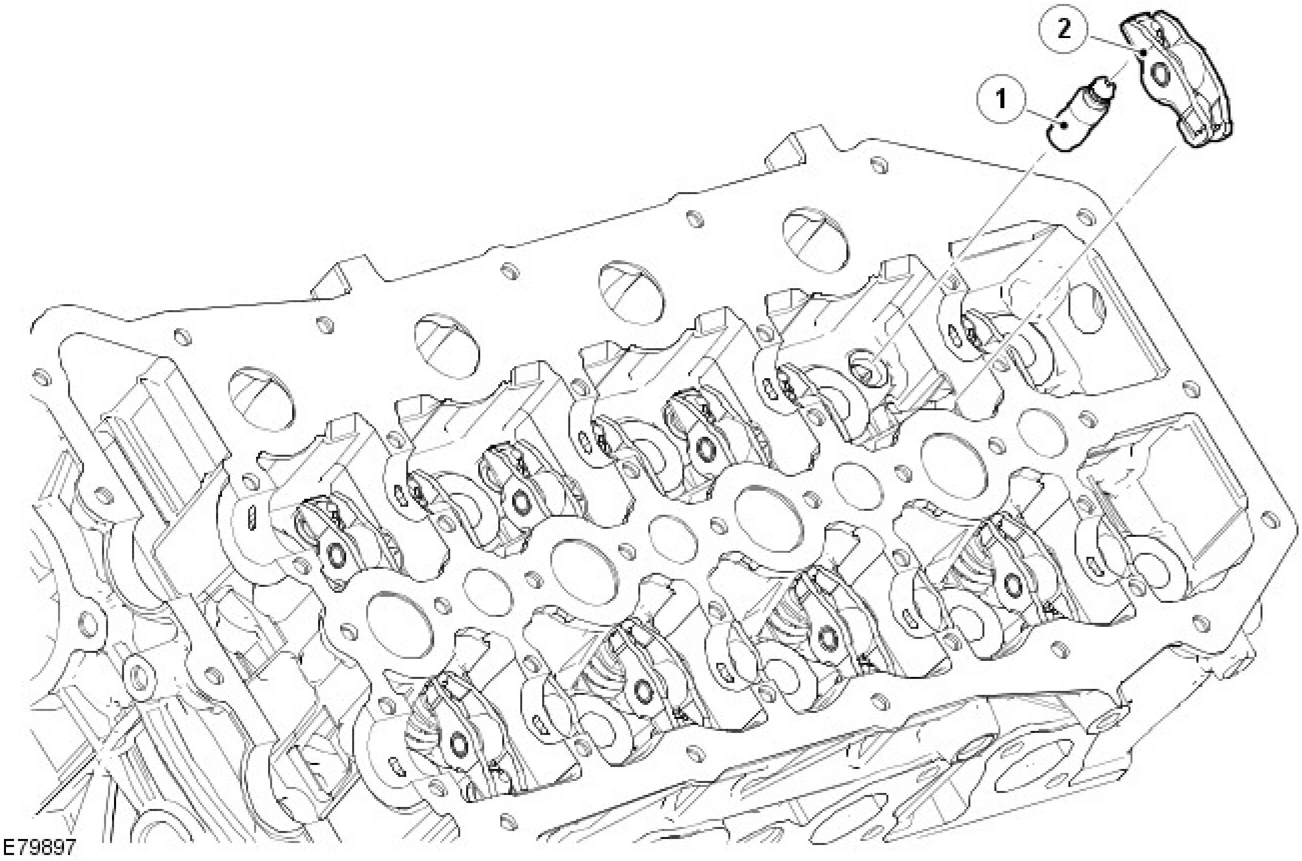
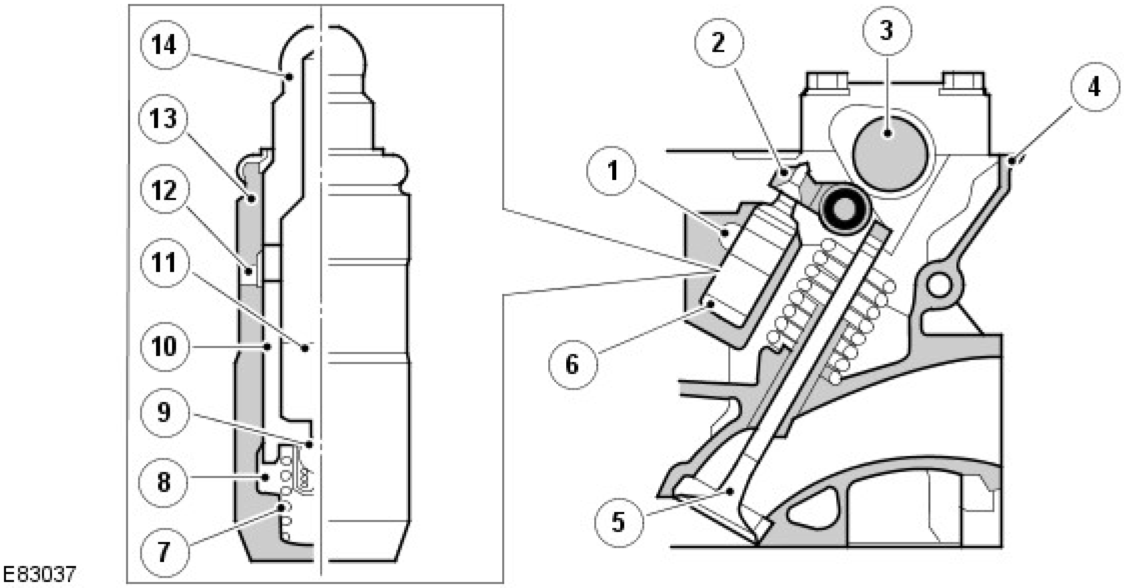
Hydraulic Lash Adjusters and Roller Finger Rockers



Item	Part Number	Description
1	-	Hydraulic lash adjuster
2	-	Roller finger rocker

The valves are operated through roller-type finger rockers and hydraulic lash adjusters, actuated by the camshaft lobes. When the camshaft lobe presses down on the top of a finger rocker, roller mechanism, the respective valve is forced down, opening the effected inlet or exhaust port. The use of this type of actuation method helps reduce friction in the valve timing mechanism.

Typical Hydraulic Lash Adjuster

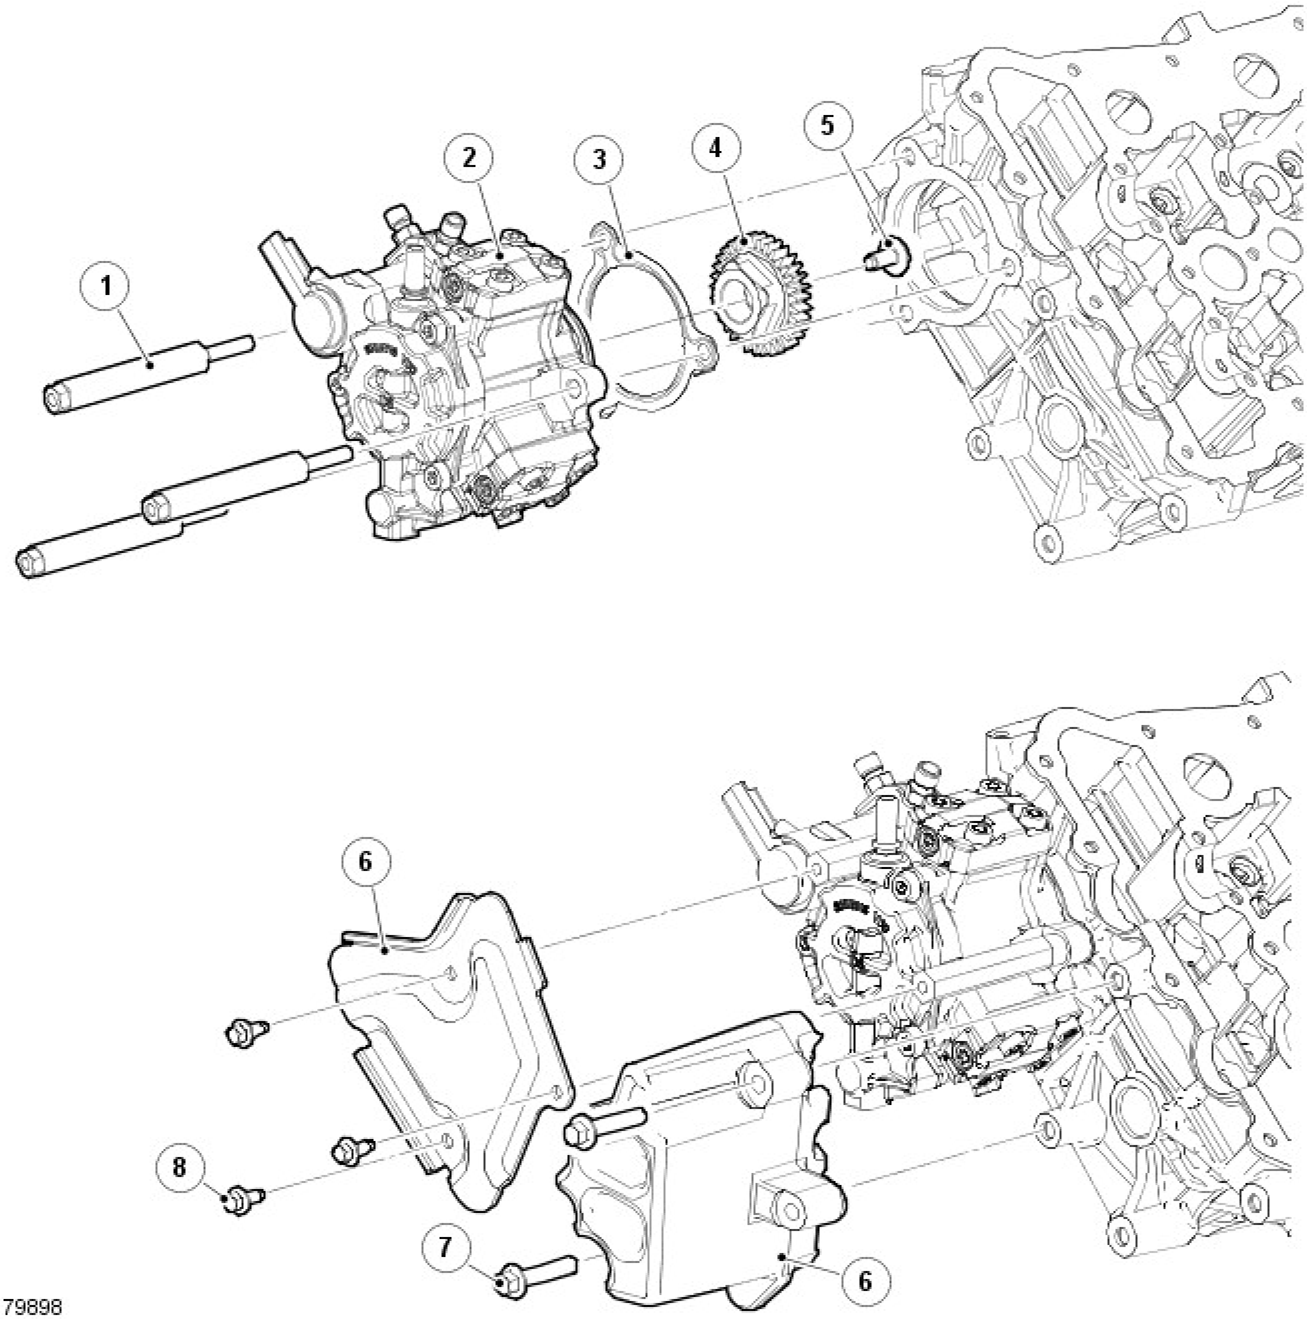


Item	Part Number	Description
1	-	Oil passage
2	-	Roller finger rocker
3	-	Camshaft
4	-	Cylinder head
5	-	Valve
6	-	Hydraulic lash adjuster
7	-	Plunger spring
8	-	High-pressure chamber
9	-	Check ball
10	-	Plunger
11	-	Reservoir chamber
12	-	Oil hole
13	-	Hydraulic lash adjuster body
14	-	Plunger cap

The body of the hydraulic lash adjuster contains a plunger and 2 chambers for oil feed and pressurised oil. The pressurised oil is supplied to the adjusters via the main oil galleries in the cylinder head and through a hole in the side of the adjuster body. The oil passes into a feed chamber in the adjuster and then through to a separate pressure chamber via a 1-way ball valve.

Oil flow from the pressure chamber is determined by the amount of clearance between the adjuster outer body and the centre plunger. Oil escapes up the side of the plunger every time the adjuster is operated, the downward pressure on the plunger forcing a corresponding amount of oil in the adjuster body to be displaced. When the downward pressure from the camshaft and finger rocker is removed (i.e. after the trailing flank of the camshaft lobe has passed), oil pressure forces the adjuster's plunger up again. This pressure is not sufficient to effect the valve operation, but eliminates the clearance between the finger rocker and top of the valve stem.

High-Pressure Fuel Pump



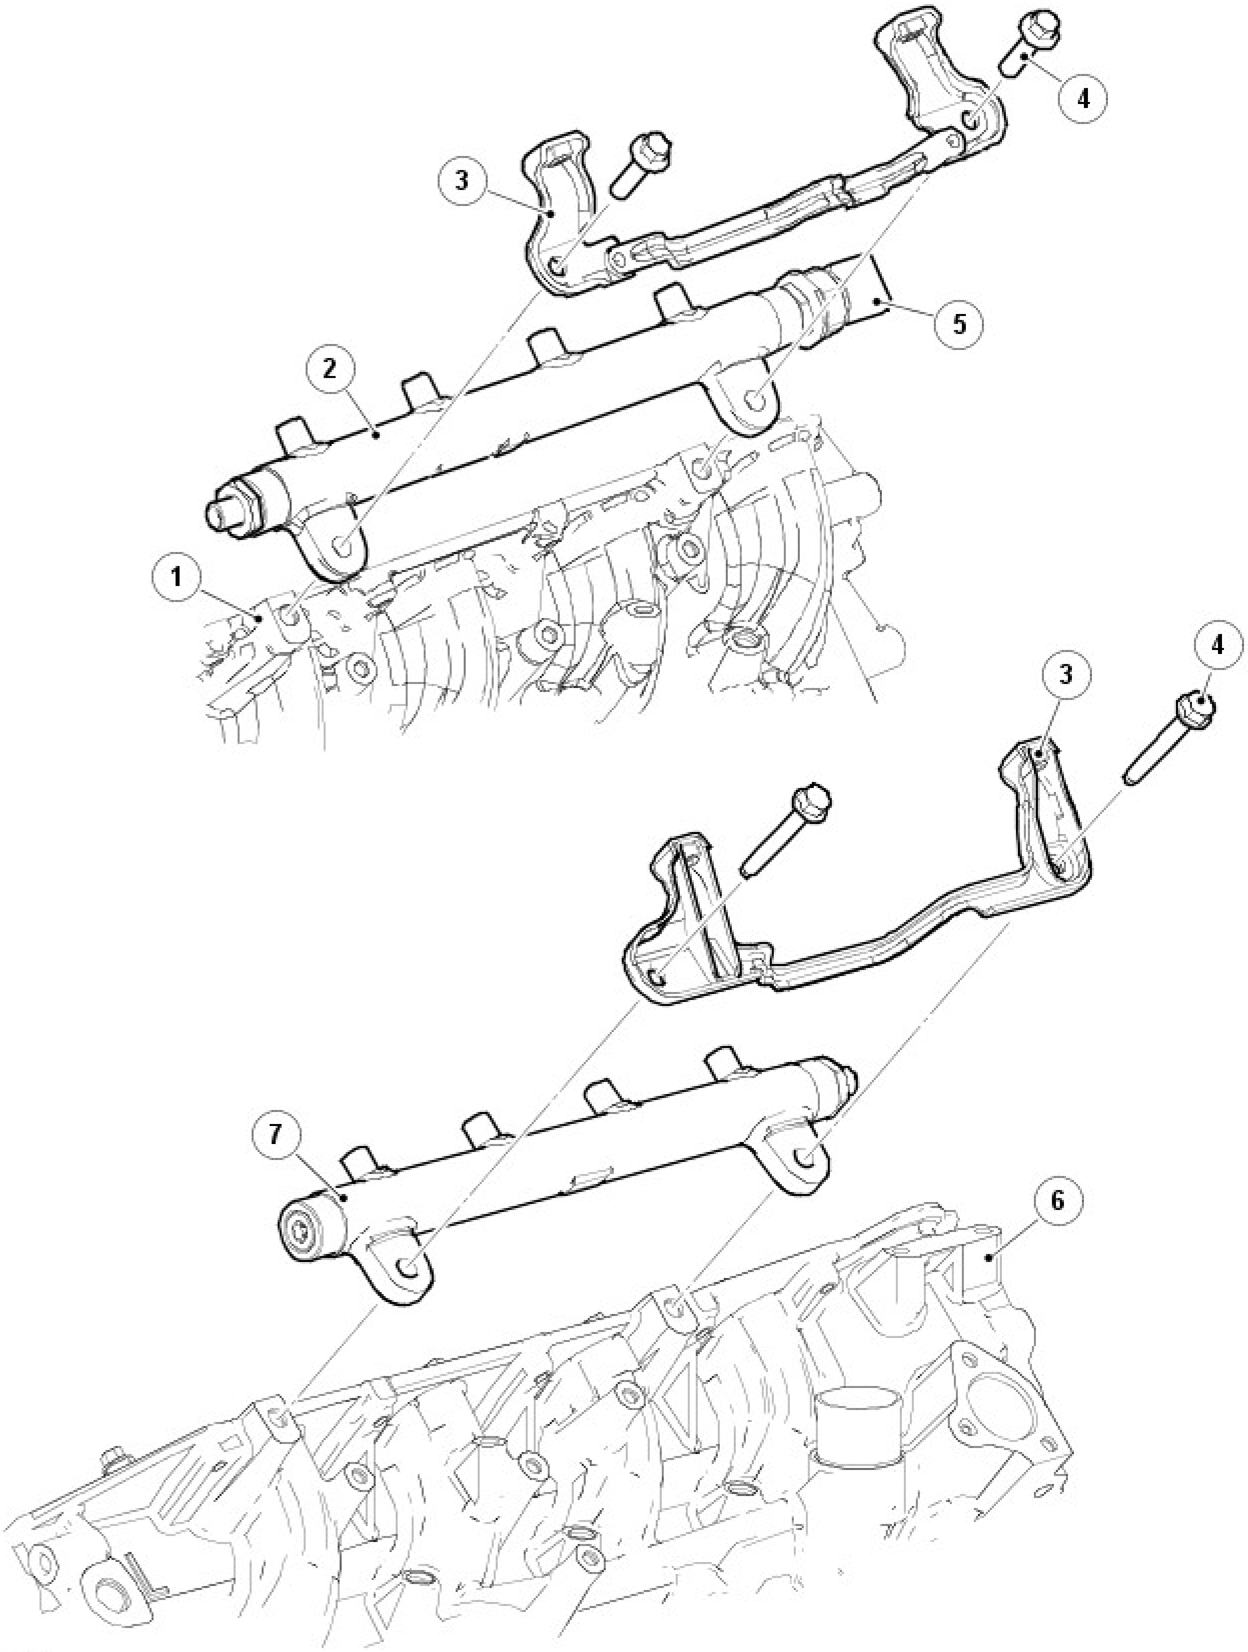
E79898

Item	Part Number	Description
1	-	Bolt (3 off)
2	-	High-pressure fuel pump
3	-	Gasket
4	-	Fuel pump drive
5	-	Washer
6	-	Fuel pump bracket shield
7	-	Bolt (3 off)
8	-	Bolt (3 off)

The high-pressure fuel pump supplies the common rail with fuel and is fixed to the front of the LH cylinder head. The pump is a 3-radial piston type and is driven by the intake camshaft of the LH cylinder head via the fuel pump drive gear. The Engine Management System (EMS) controls pump pressure (depending on engine speed and load) up to a maximum of 1700 bar.For additional information, refer to:

Electronic Engine Controls (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Description and Operation),
Fuel Charging and Controls (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, Description and Operation).

High-Pressure Fuel Rails



E79899

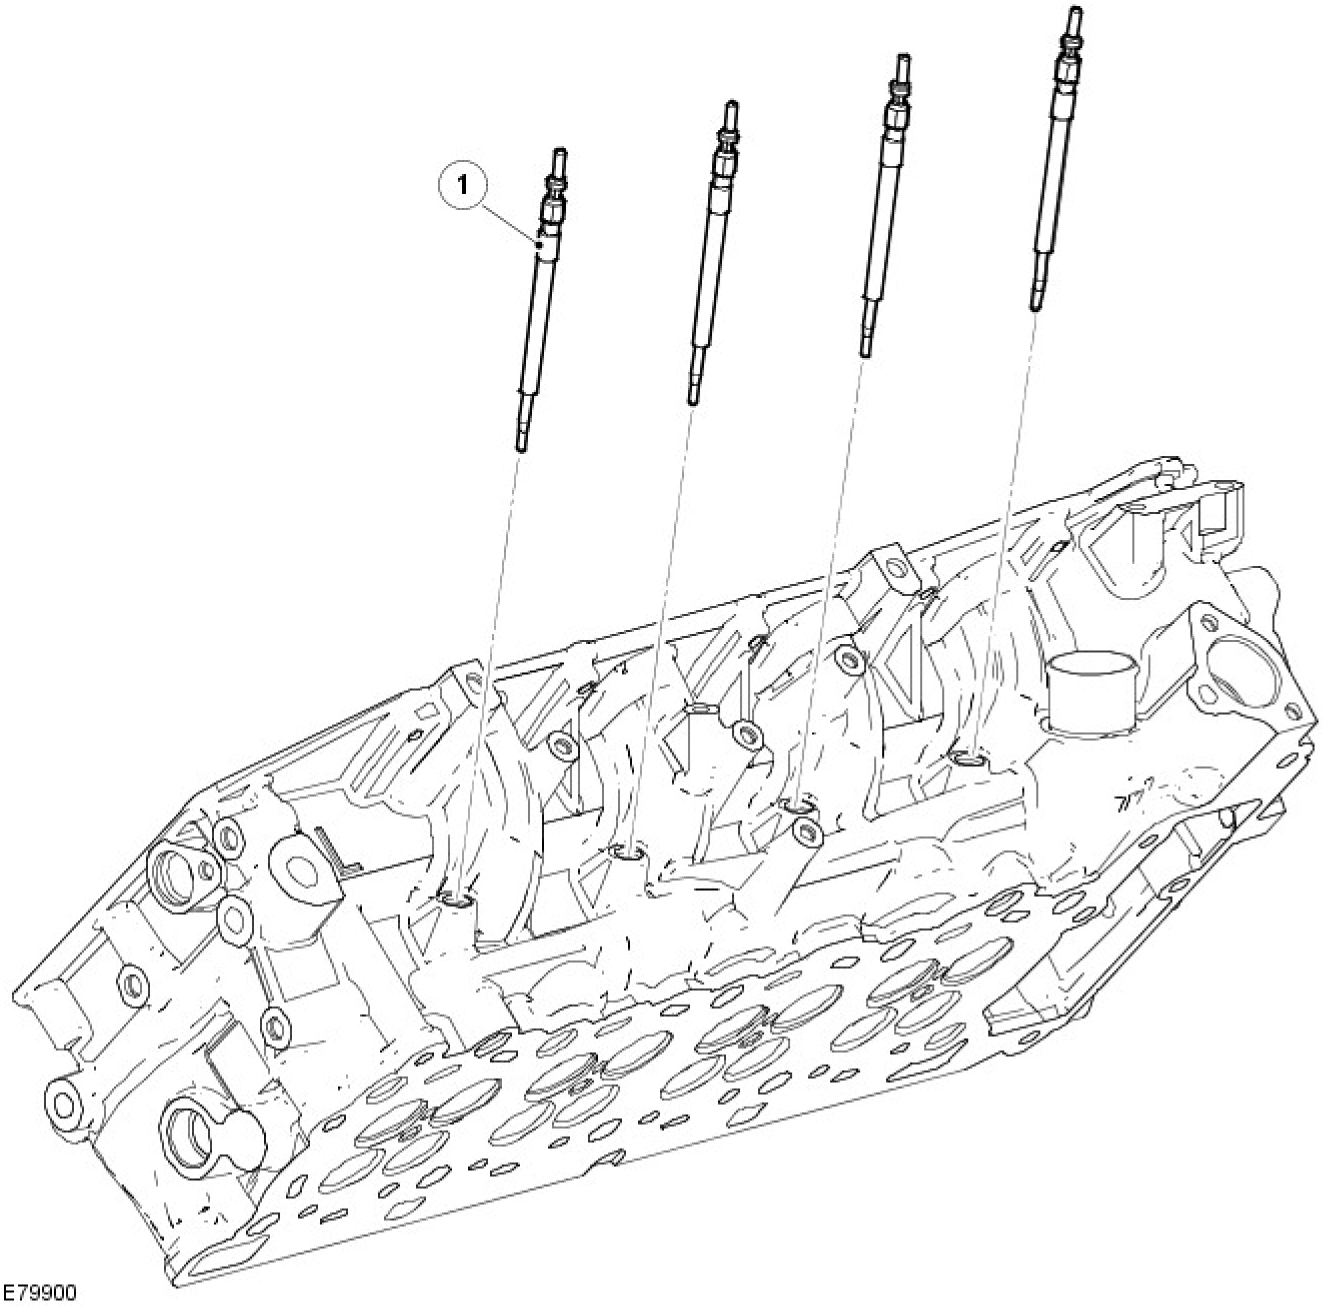
Item	Part Number	Description
1	-	RH cylinder head
2	-	RH high-pressure fuel rail
3	-	Intake manifold support bracket
4	-	Bolt (4 off, 2 per cylinder head)
5	-	Fuel pressure sensor

6	-	LH cylinder head
7	-	LH high-pressure fuel rail

The fuel rails are manufactured from forged steel. They store the fuel at high pressure and prevent pressure fluctuations in the high-pressure system. A fuel rail pressure sensor is fitted into a threaded bore in the rear end of the RH rail. The sensor is connected to the ECM via the engine harness, which supplies a 5V power supply, ground and signal connections. The sensor is a diaphragm type sensor, which changes shape as the fuel pressure increases or decreases. The ECM compares this signal to values stored in its memory to calculate the actual fuel pressure present in the rail.For additional information, refer to:

> Fuel Charging and Controls (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, Description and Operation),
> Electronic Engine Controls (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Description and Operation).

Glow Plugs



Item	Part Number	Description
1	-	Glow plug (4 off per cylinder head)

The glow plugs are arranged centrally on the inlet side of the cylinder head, between the 2 inlet ports of each cylinder.

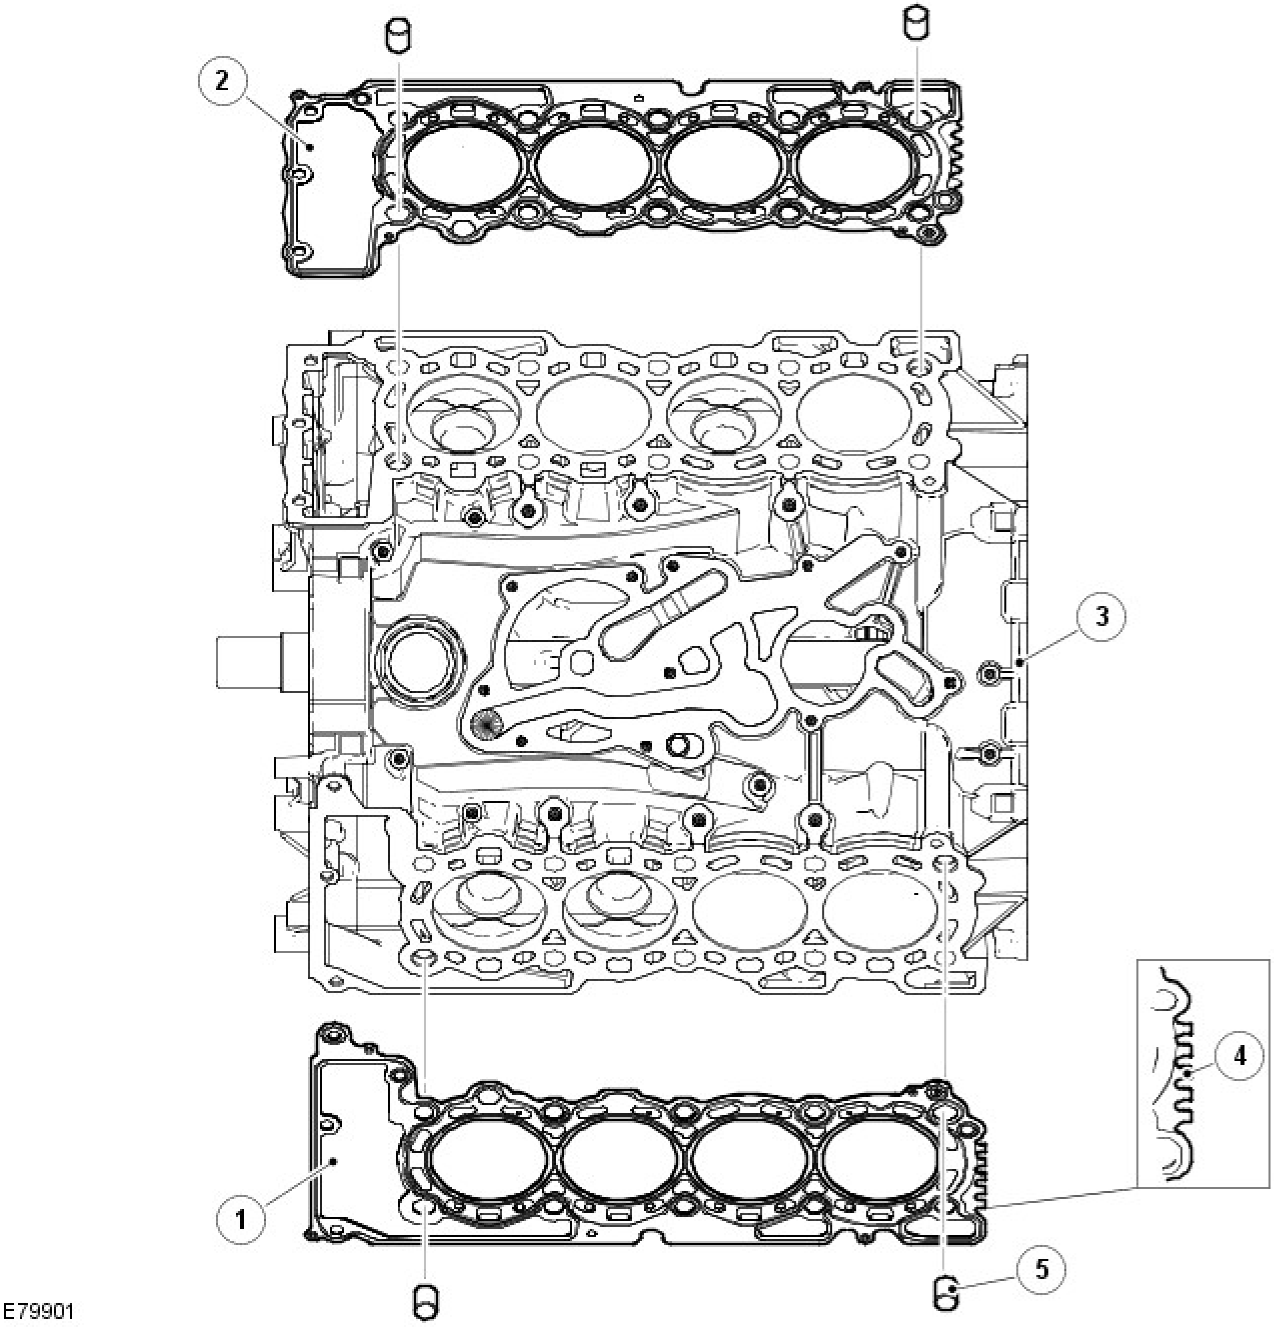
The purpose of the glow plugs is:

- Assist cold engine start

- Reduce exhaust emissions at low engine load/speed

The main part of the glow plug is a tubular heating element that protrudes into the combustion chamber of the engine. The heating element contains a spiral filament that is encased in magnesium oxide powder. At the tip of the tubular heating element is the heater coil. Behind the heater coil and connected in series is a control coil. The control coil regulates the heater coil to ensure it does not overheat and cause a possible failure.
For additional information, refer to: Electronic Engine Controls (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Description and Operation).

Cylinder Head Gaskets



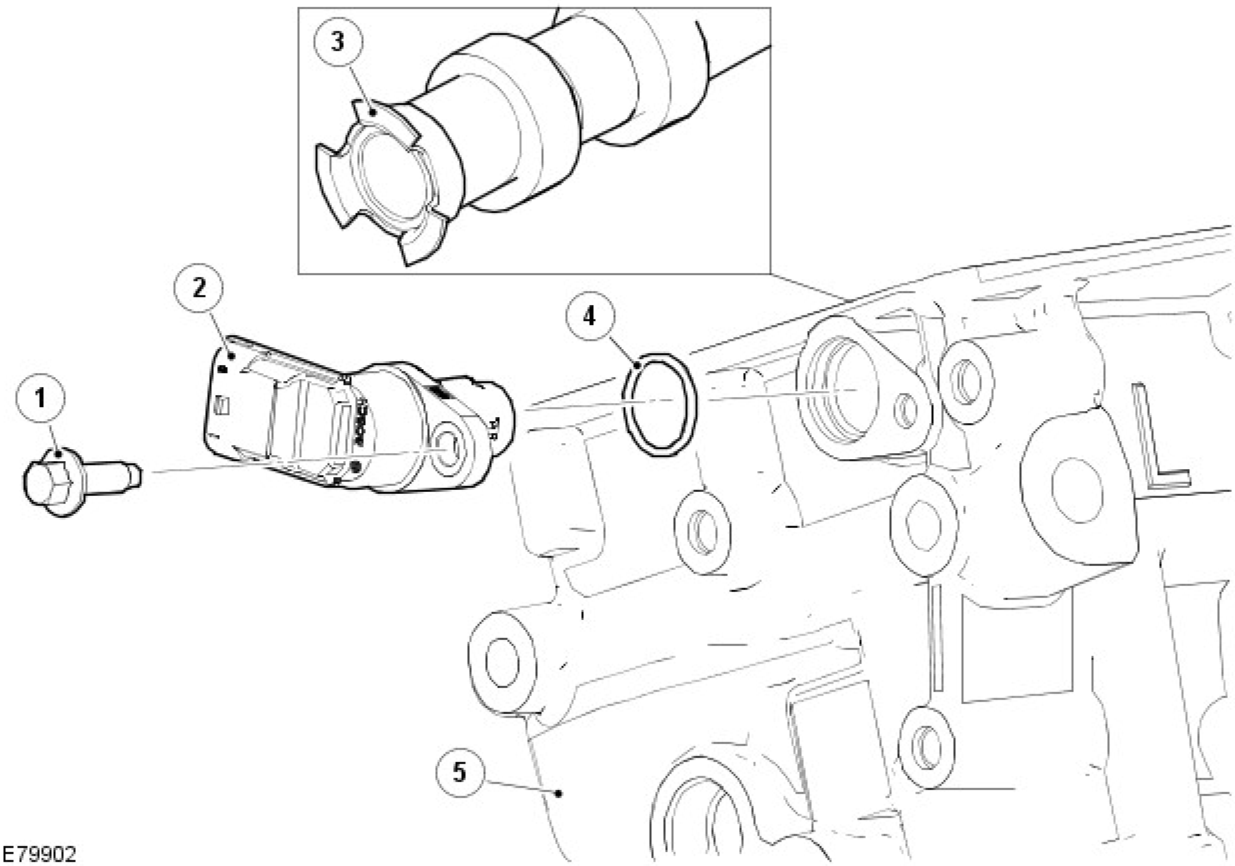
Item	Part Number	Description
1	-	LH cylinder head gasket
2	-	RH cylinder head gasket
3	-	Cylinder block
4	-	Identification teeth
5	-	Cylinder head locating dowel (2 off per cylinder head)

The cylinder head gasket is a multi-layer, laminated steel type and is available in 5 different thicknesses. The choice of gasket thickness is dependent on the maximum piston protrusion. Gasket thickness is identified by teeth cut into the rear end of the gasket.

To calculate the correct cylinder head gasket thickness, each piston must be measured at 2 points, with an average of the 2 measurements taken to determine the piston protrusion. The highest of the 4 measurements will determine the gasket required for that particular cylinder head.

• NOTE: The difference between the maximum and minimum protrusion measurement in any one bank should not be greater than 0.1mm. It is permissible to have a different grade of gaskets between the LH and RH banks.

Camshaft Position (CMP) Sensor

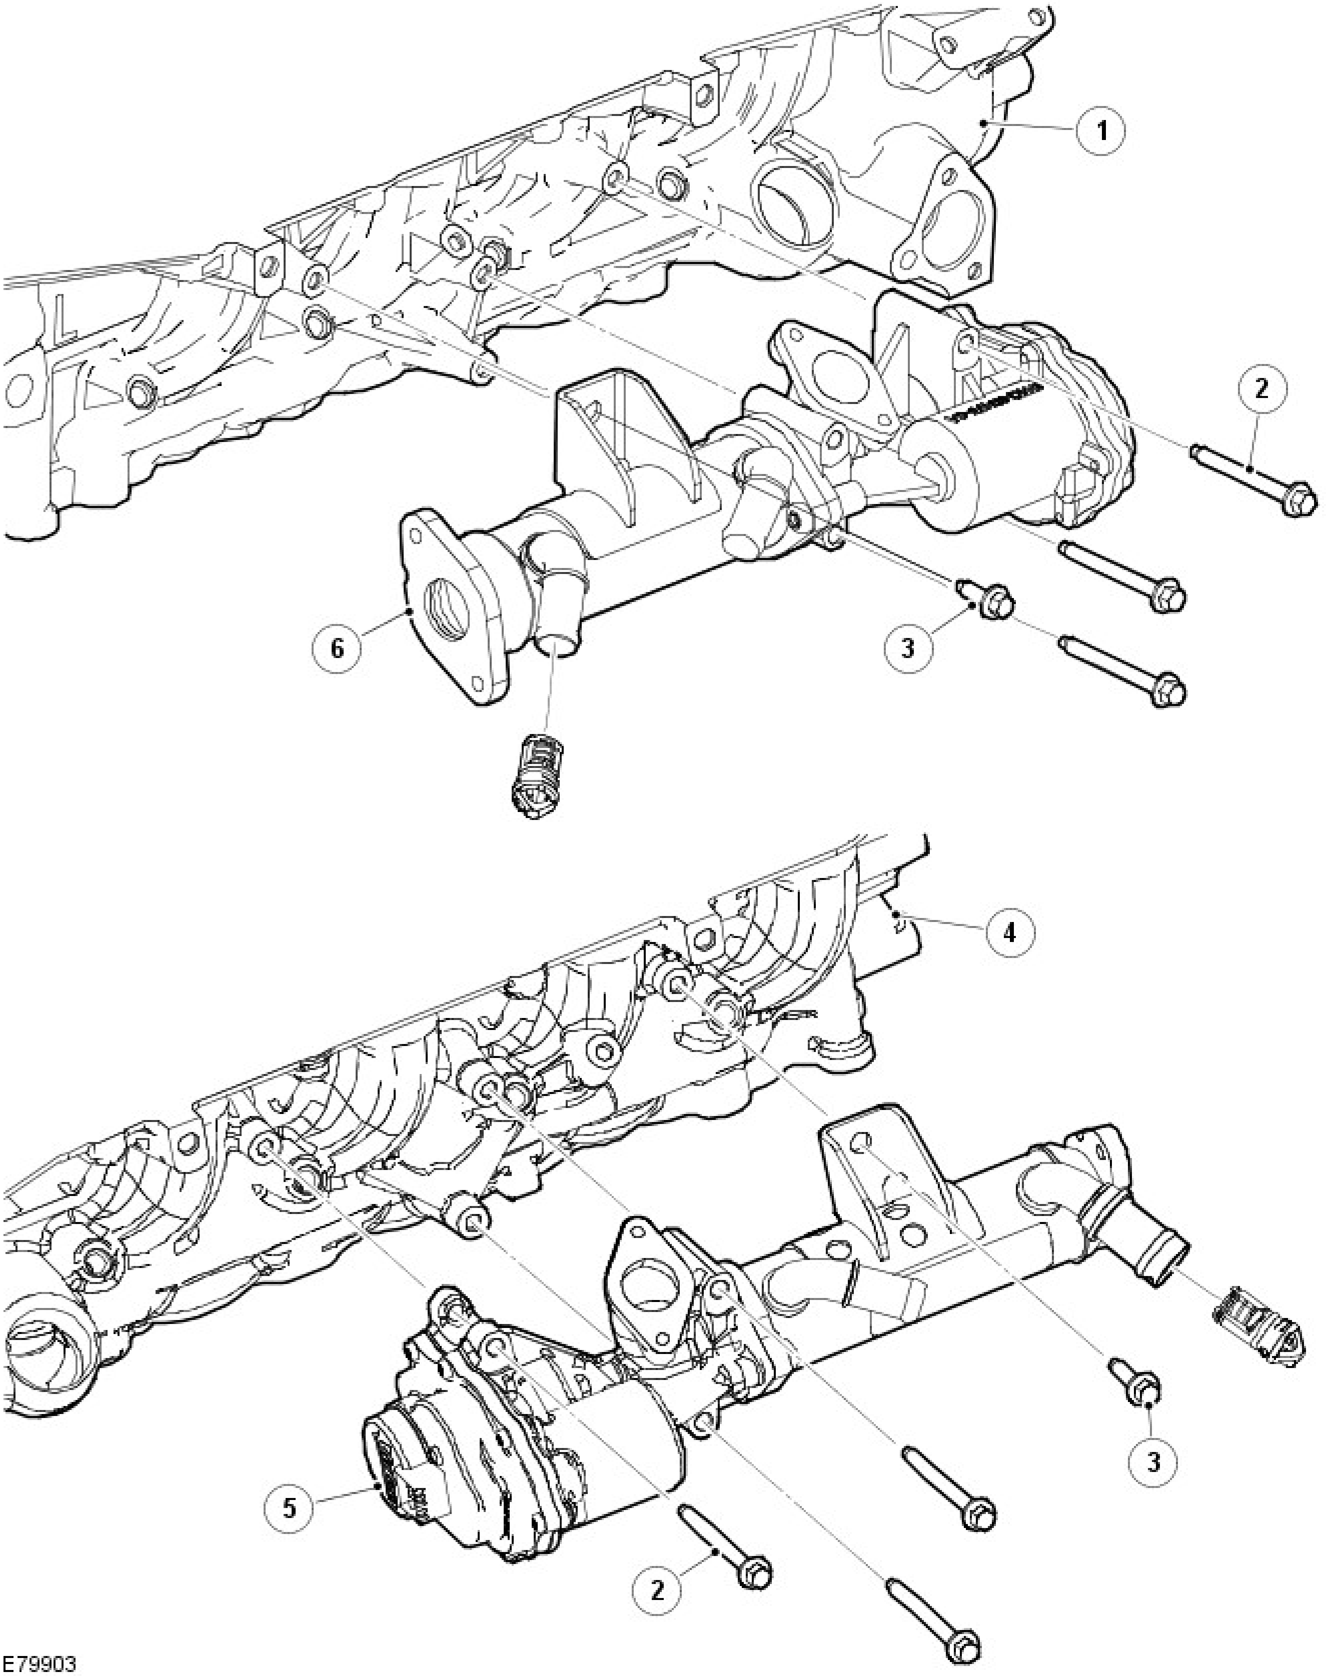


E79902

Item	Part Number	Description
1	-	Bolt (1 off)
2	-	CMP sensor
3	-	LH cylinder head camshaft
4	-	O-ring seal
5	-	Cylinder head

The CMP sensor locates through a hole in a flange on the rear RH side of the LH cylinder head. The rear of the inlet camshaft incorporates a trigger wheel, which is used in conjunction with the sensor to measure engine position.
For additional information, refer to: Electronic Engine Controls (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Description and Operation).

Exhaust Gas Recirculation (EGR) Valve Assembly



E79903

Item	Part Number	Description
1	-	LH cylinder head
2	-	Bolt (6 off, 3 per assembly)
3	-	Bolt (2 off, 1 per assembly)
4	-	RH EGR cooling and valve assembly
5	-	RH cylinder head

6	-	LH EGR cooling and valve assembly

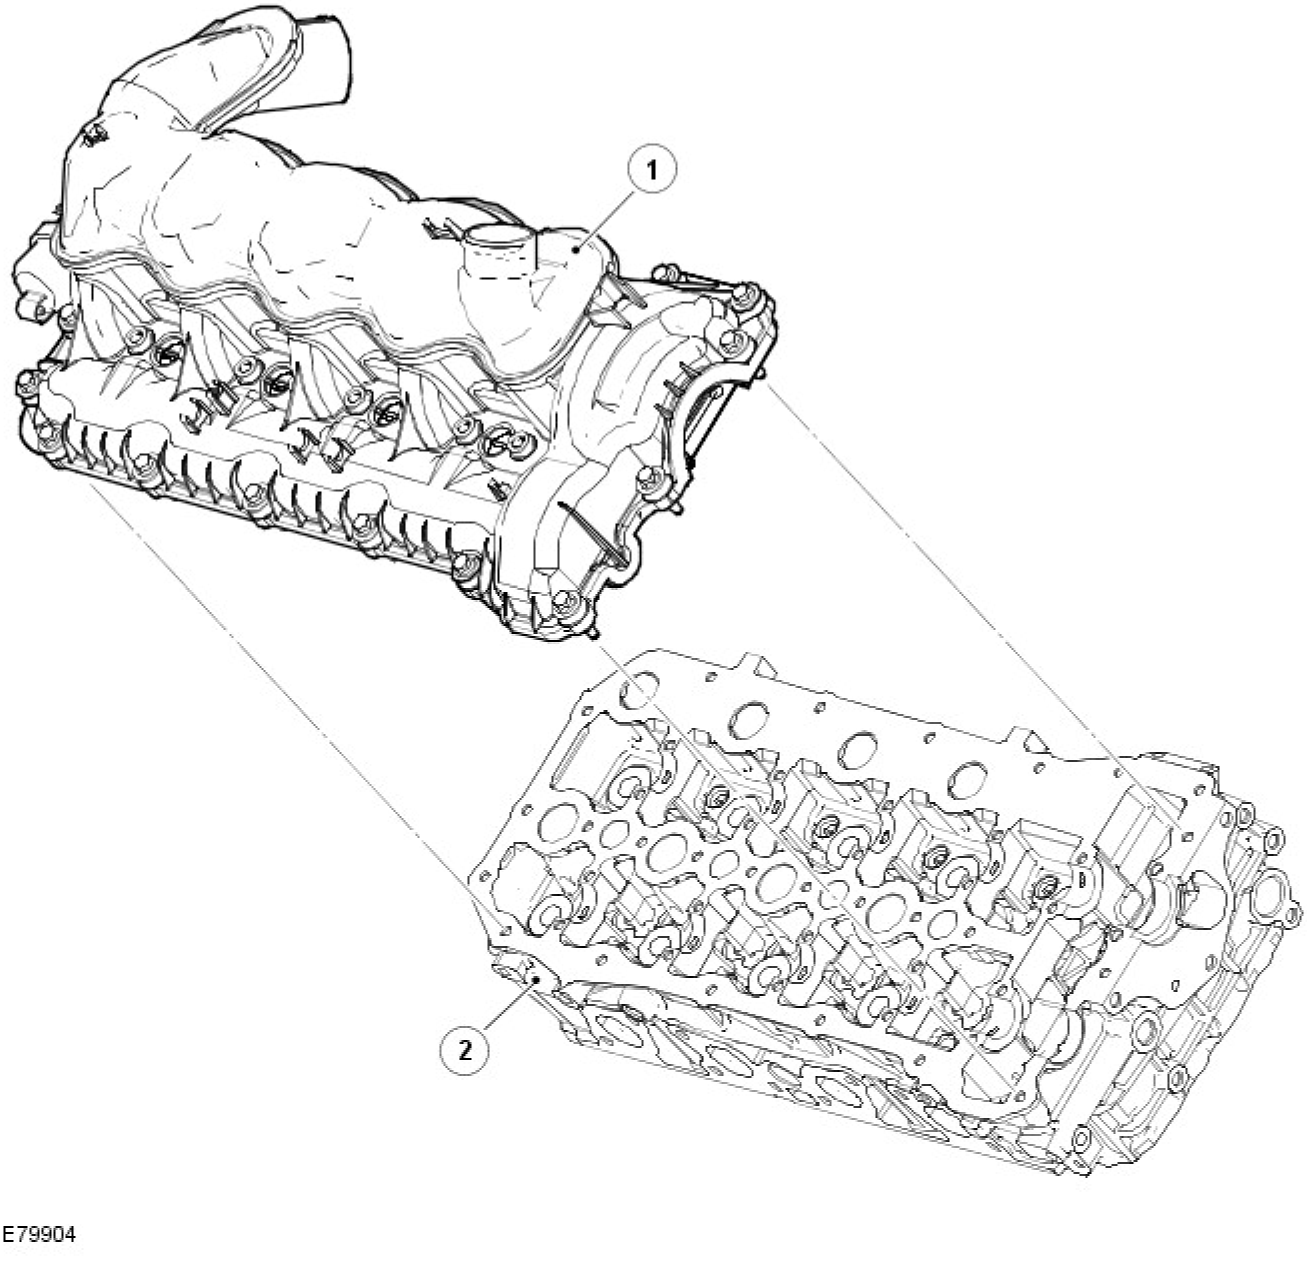
The combined EGR modulator and cooler assemblies are located inboard of each cylinder head, between the vee. The cooler side of the EGR valve assembly is connected to the vehicle cooling system via hoses. The exhaust side is connected directly into the exhaust manifolds on each side. The exhaust gas passes through the cooler and is expelled via the actuator and a metal pipe into the throttle housing. The EGR modulator is a Direct Current (DC) motor, which is operated via a reduction gear drive and is controlled by the ECM. The ECM uses the EGR modulator to control the amount of exhaust gas being recirculated in order to reduce exhaust emissions and combustion noise. The EGR is enabled when the engine is at normal operating temperature and under cruising conditions.
For additional information, refer to: Engine Emission Control (303-08D Engine Emission Control - TDV8 3.6L Diesel, Description and Operation).

Oil Pressure Switch

The oil pressure switch is located in the front of the RH cylinder head. For more information, refer to the 'Lubrication System' section.

Inlet Manifold/Camshaft Cover

- NOTE: RH cylinder head and camshaft cover shown, LH similar.



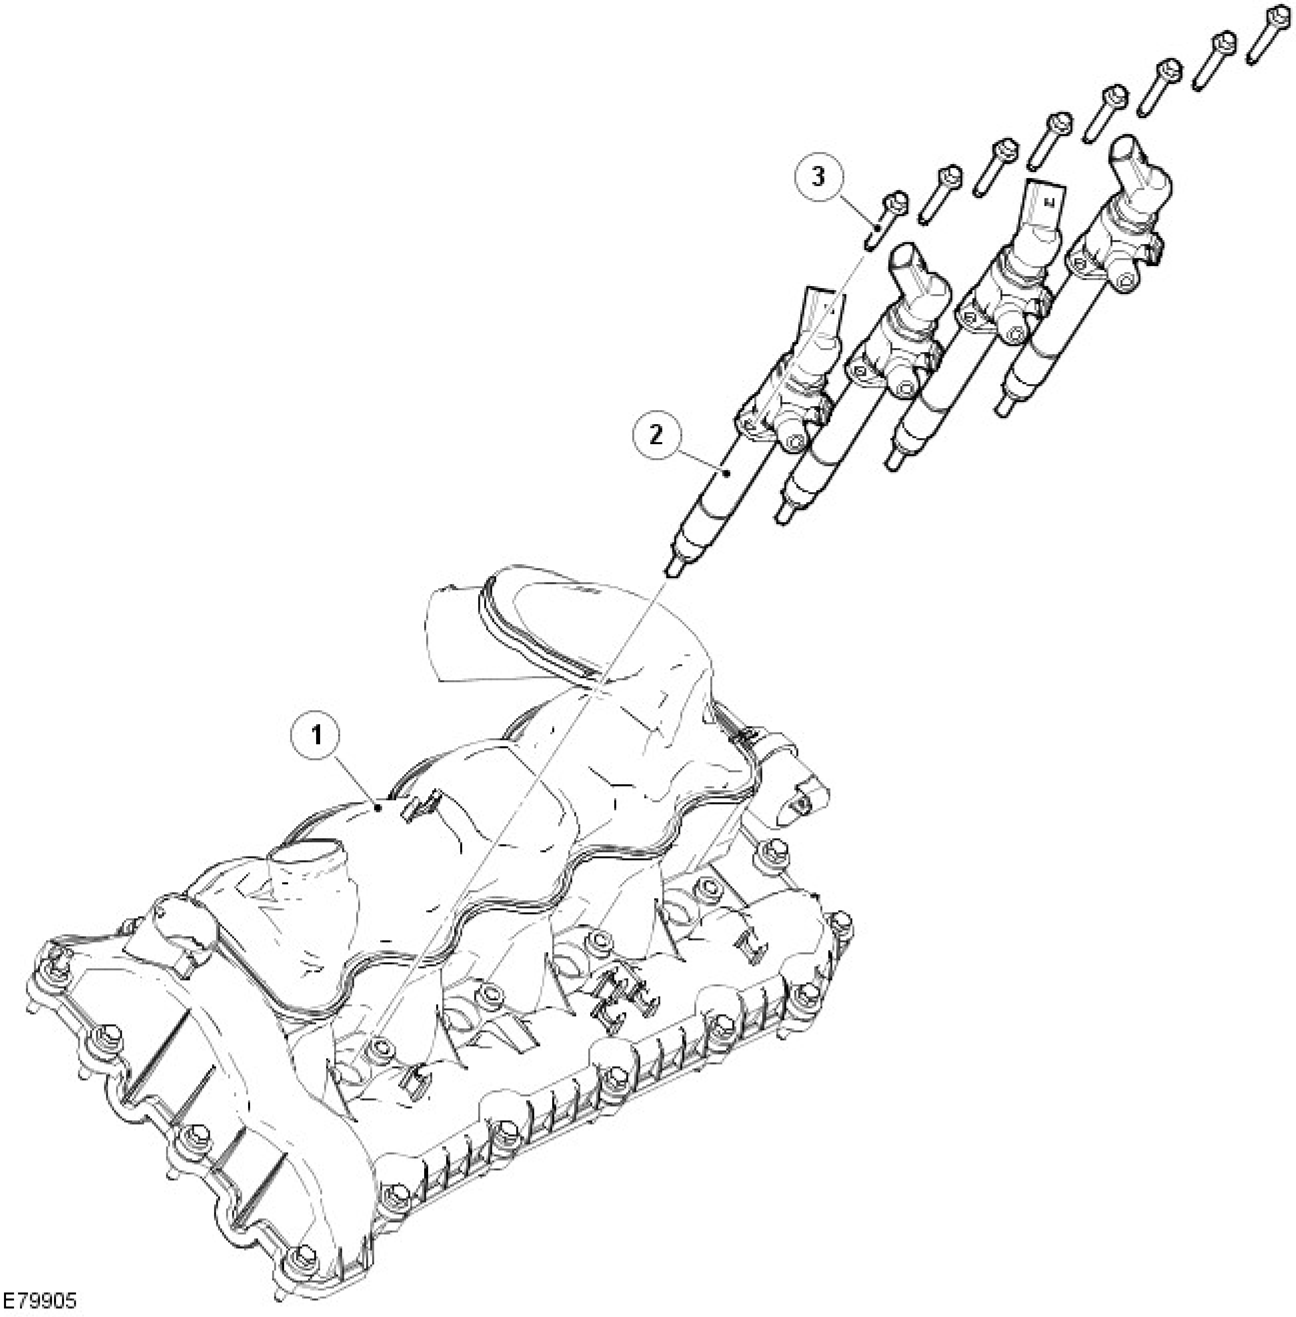
Item	Part Number	Description
1	-	Inlet manifold/camshaft cover
2	-	Cylinder head

The inlet manifolds are integrated with the moulded camshaft covers and work in conjunction with the intake tracts within the cylinder heads to provide variable intake swirl through port deactivation.
For additional information, refer to: Intake Air Distribution and Filtering (303-12D Intake Air Distribution and Filtering - TDV8 3.6L Diesel, Description and Operation).

The covers are manufactured from 2 layers of 2 mm sound-deadened steel that are bonded together by a visco-elastic damping material. This provides a fully formable, acoustically dead panel. The covers are rubber mounted and include additional foam absorbtion.

The LH cover incorporates the oil filler cap assembly.

- NOTE: LH cylinder head and camshaft cover shown, LH similar.



Item	Part Number	Description
1	-	Inlet manifold/camshaft cover
2	-	Injectors (8 off, 4 per cylinder head)

3	-	Bolt (16 off, 8 per cylinder head)

The 8, side fed, piezo electrically controlled fuel injectors are mounted in the inlet manifold/camshaft cover, which locates them centrally in each cylinder head. An O-ring seals each injector to the manifold interface.

The start of fuel injection and the quantity of fuel injected is controlled directly by the ECM.
For additional information, refer to: Electronic Engine Controls (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Description and Operation).

LUBRICATION SYSTEM

The lubrication system is a wet oil pan, pressure fed type. It lubricates the engine sliding surfaces, dissipates heat, absorbs fuel combustion residue and seals off the gap between the cylinder and piston.

Oil is drawn from the reservoir in the oil pan and pressurised by the crankshaft driven oil pump. The output from the oil pump is then filtered and distributed through internal oil passageways.

All moving parts are lubricated by pressure or splash oil. Pressurised oil is also provided for operation of the hydraulic adjusters and the timing gear chain tensioners.

The engine is lubricated by a force-fed oil circulation system with a full flow oil filter. The oil cooler forms a unit with the oil filter and fuel cooler, which is mounted centrally in the middle of the cylinder block between the 2 banks of cylinders. The engine oil is cooled using the engine cooling system. This eliminates the need for an additional engine oil cooler.

The fuel cooler, which forms part of the oil filter body, is also cooled by engine coolant. In addition there is a further fuel cooler in the return line to the fuel tank.

Oil returns to the oil pan under gravity. Large drain holes through the cylinder heads and cylinder block ensure the quick return of the oil, reducing the volume of oil required and enabling an accurate check of the contents soon after the engine stops.

System replenishment is through the oil filler cap on the LH inlet manifold/camshaft cover.

Turbocharger Oil Return

Due to the wide range of inclines the vehicle operates across, the geometry of the oil pan has been configured to guarantee oil pick-up across all operating angles. Land Rover have developed an oil-scavenge system to guarantee excellent oil flow through the turbochargers on severe side-slopes. Whilst the 60-degree cylinder bank angle of a V6 engine allows the turbochargers to be packaged relatively higher in the vehicle, to obtain the best configuration for the V8 engine, the turbochargers must be sited much lower. At extreme angles, there is a risk they may be below the oil level on the oil pan, restricting oil return flow. To overcome this, the engine uses a rotor pump located on the front of the vacuum pump, to help draw oil back from the turbochargers to guarantee good flow across the full range of operating angles.

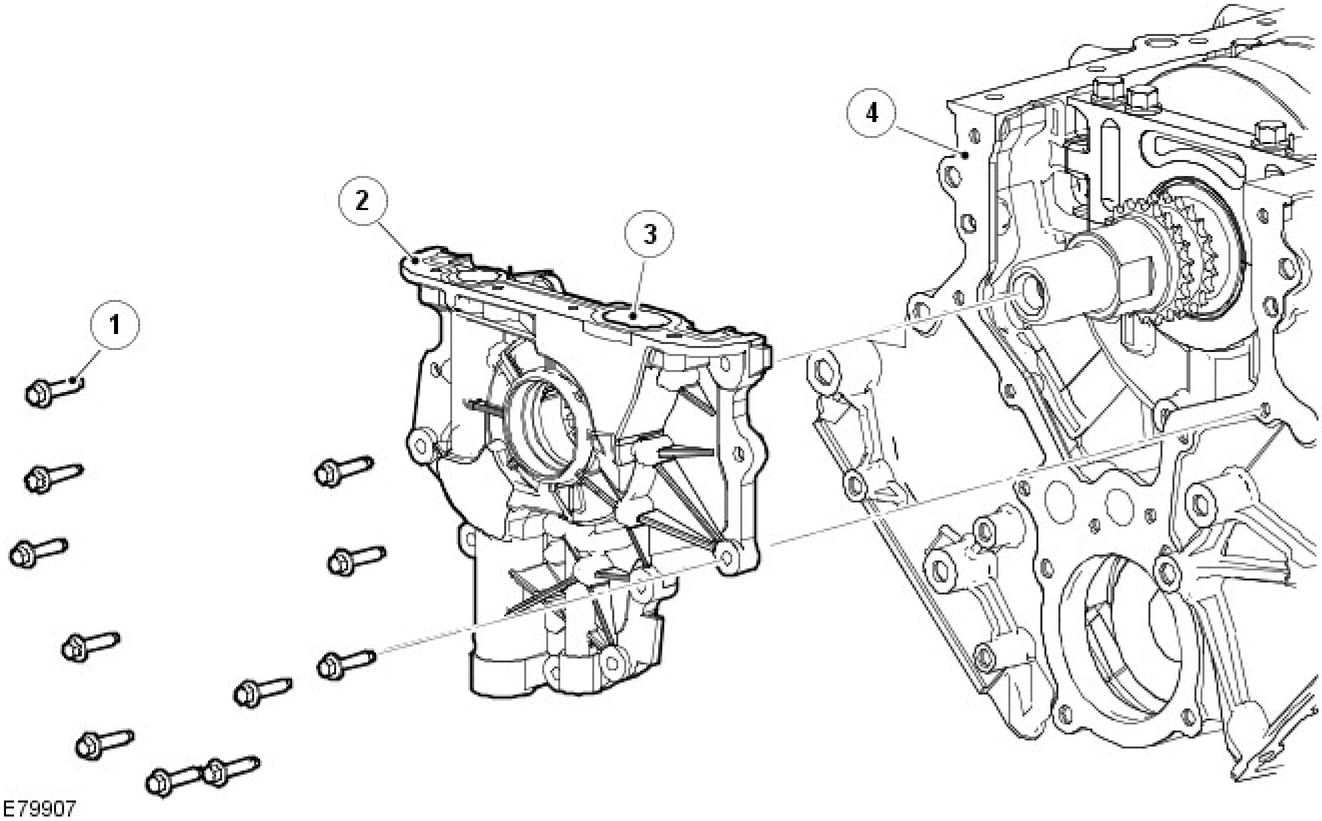
Oil Pick-up

The moulded composite oil pick-up is immersed in the oil reservoir to provide a supply to the oil pump during all normal vehicle attitudes. A mesh screen in the inlet prevents debris from entering the oil system.

Oil Pump



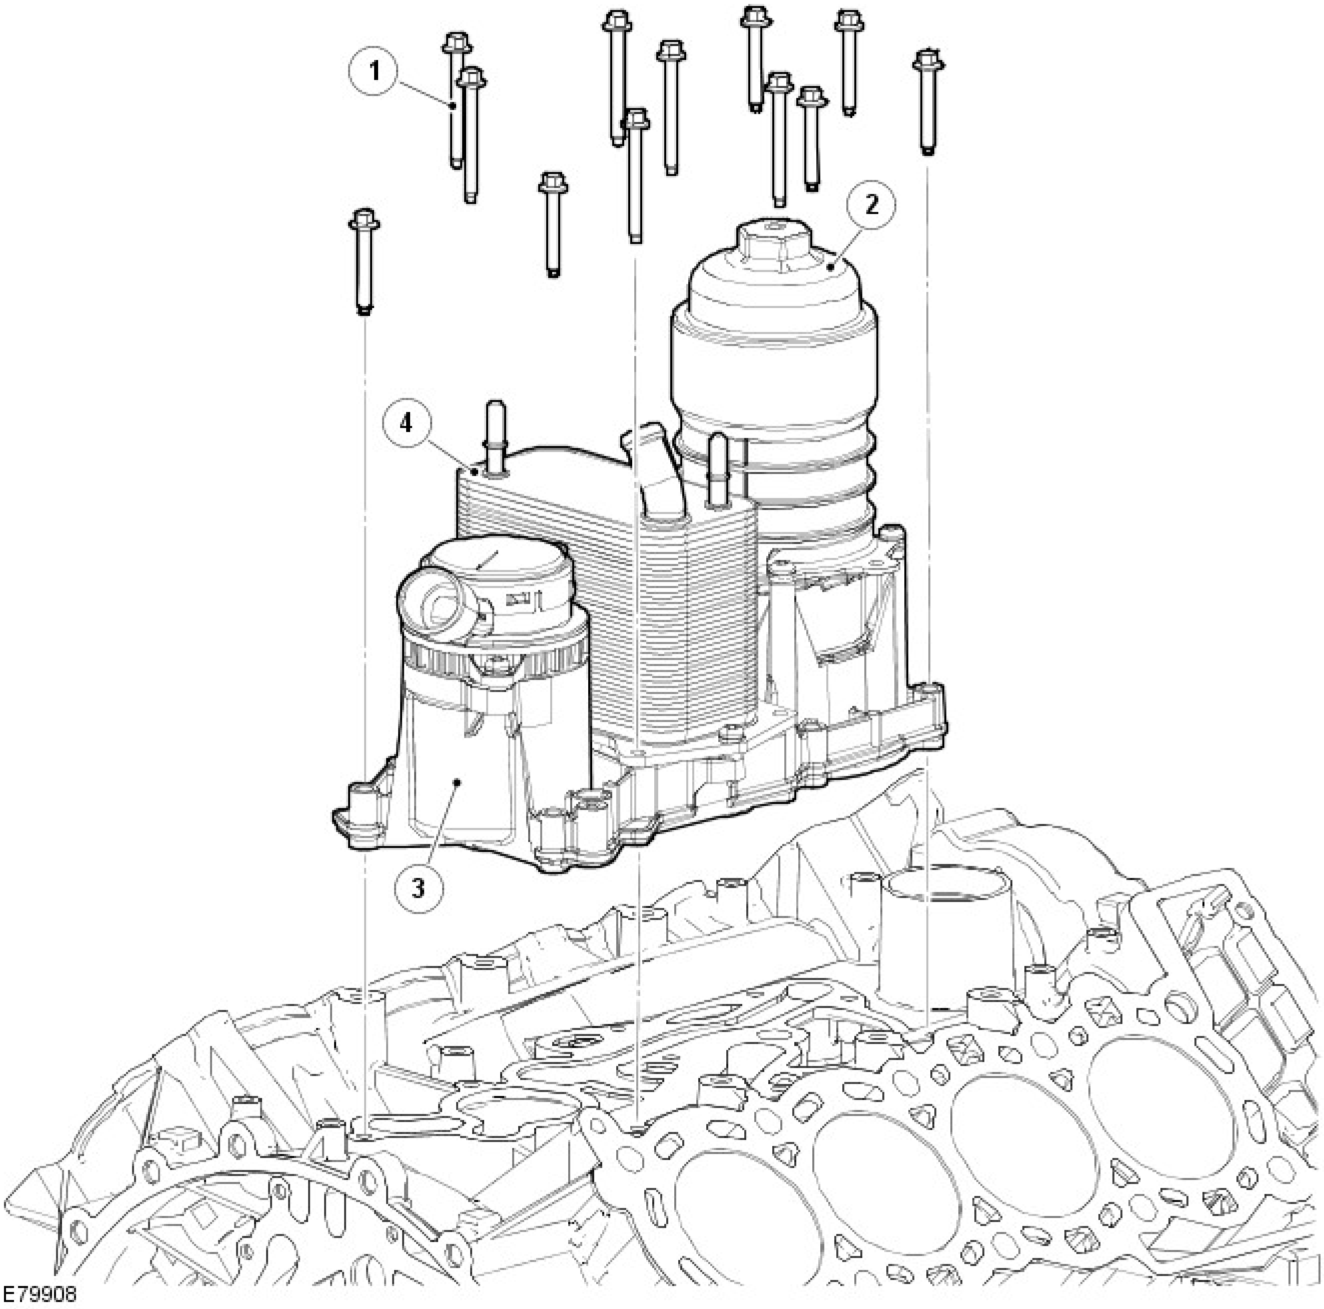
Item	Part Number	Description
1	-	Bolt (11 off)
2	-	Oil pump housing
3	-	Oil inlet
4	-	Cylinder block

The oil pump is a gear type pump and is bolted and dowelled to the front of the engine block. It is sealed by means of a rubber gasket, which is recessed into the oil pump housing. The pump inlet and outlet ports align with oil passages in the ladder frame.

The pumping element is an eccentric rotor, which is directly driven by flats on the crankshaft. An integral pressure relief valve regulates pump outlet pressure at 4.5 bar (65.25 Psi).

The front crankshaft oil seal is housed in the oil pump casing.

Oil Filter and Oil/Fuel Cooler Assembly



Item	Part Number	Description
1	-	Bolt (12 off)
2	-	Oil filter and cooler assembly
3	-	Crankcase ventilation system
4	-	Fuel cooler

The oil filter is a replaceable cartridge installed on an adapter in the center of the 'vee'. An internal bypass facility permits full flow bypass if the filter is blocked.
For additional information, refer to: Fuel Tank and Lines (310-01D Fuel Tank and Lines - TDV8 3.6L Diesel, Description and Operation).

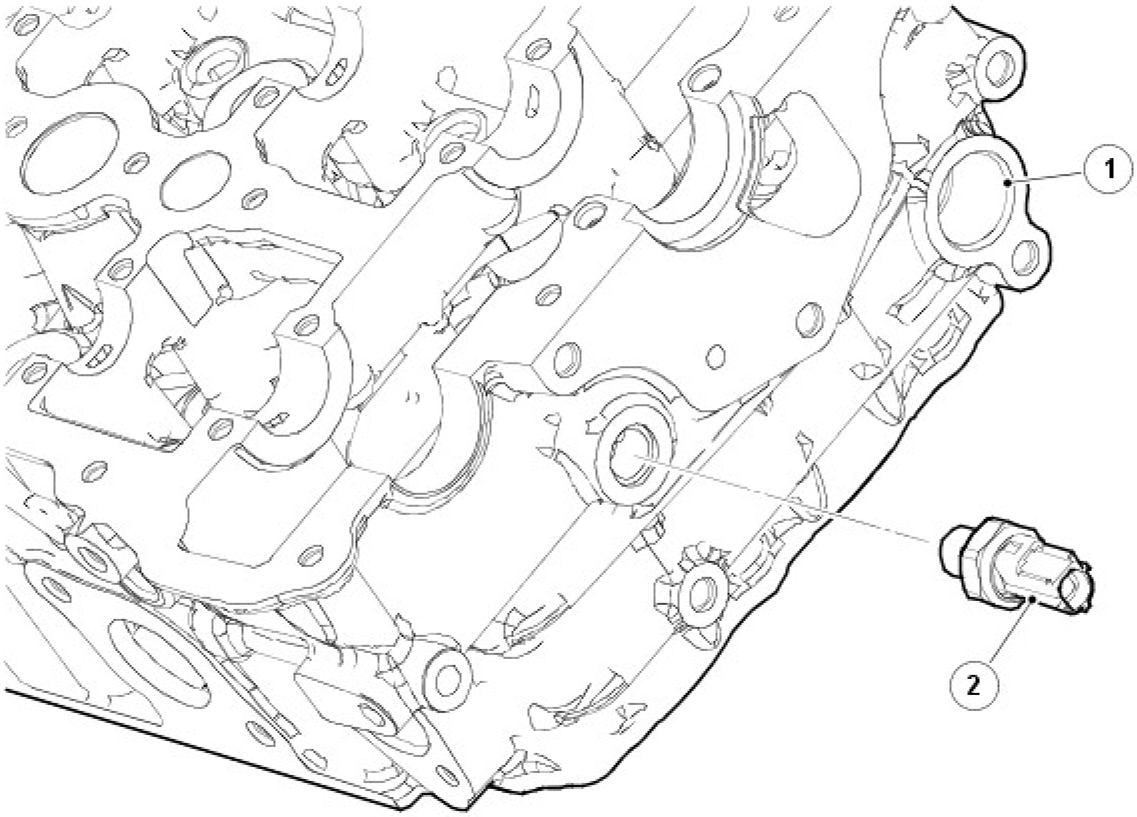
- NOTE: In service care must be taken when removing the oil filter to minimise oil drips and spillage into the engine 'vee' and cam covers.

The crankcase ventilation system ensures that all gasses emitted from the crankcase during engine running are separated from any oil particles.
For additional information, refer to: Engine Emission Control (303-08D Engine Emission Control - TDV8 3.6L Diesel, Description and Operation).

Two fuel coolers are fitted to the vehicle. One is located in the 'vee' of the engine block, and has a coolant system connection to aid heat transfer. The second cooler is a body mounted cooler located in the fuel return line on the LH side of the engine compartment and is a fuel to air cooler.

The body mounted fuel cooler uses engine coolant, direct from the lower part of the radiator, to cool fuel returning to the tank from the High Pressure (HP) injection pump.
For additional information, refer to: Fuel Tank and Lines (310-01D Fuel Tank and Lines - TDV8 3.6L Diesel, Description and Operation).

Oil Pressure Switch



E79909

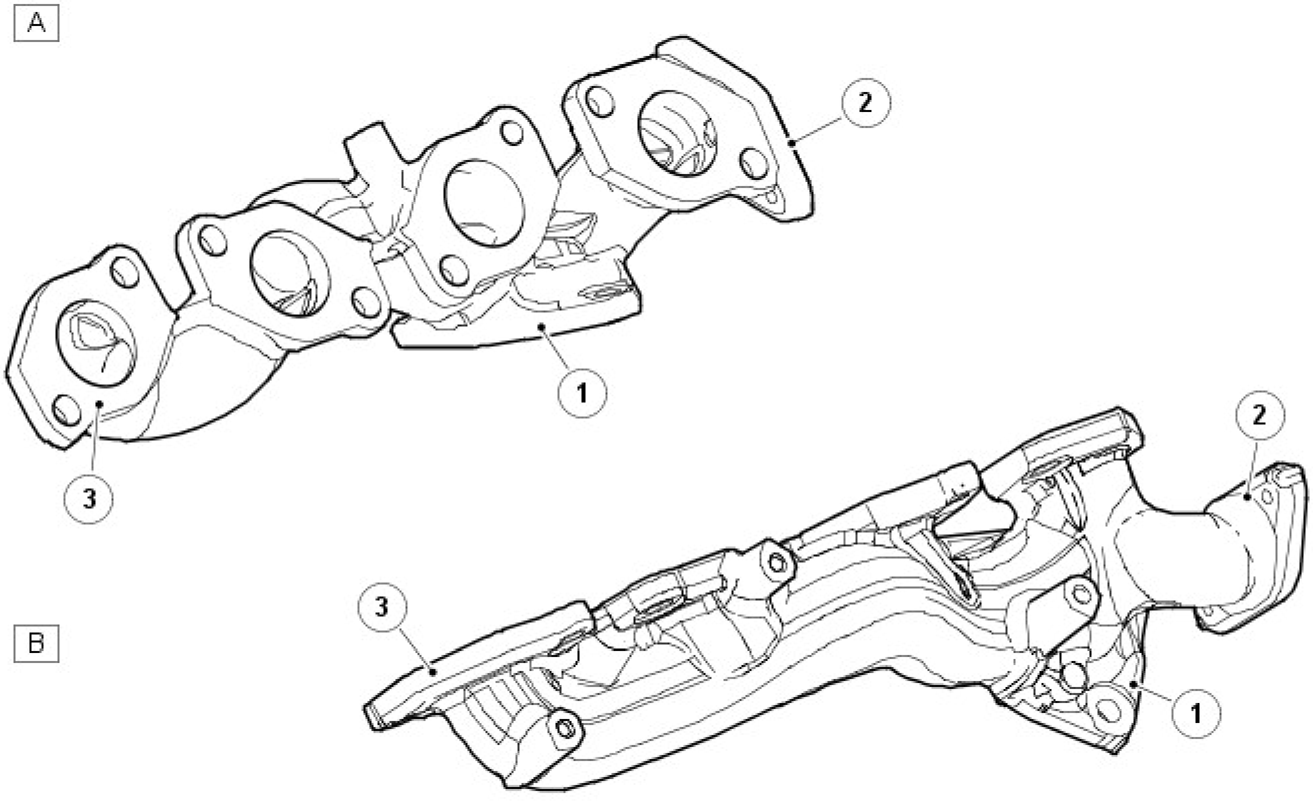
Item	Part Number	Description
1	-	RH cylinder head
2	-	Oil pressure switch

The oil pressure switch, located in the front of the RH cylinder head, connects a ground input to the instrument cluster when oil pressure is present. The switch operates at a pressure of 0.15 to 0.41 bar (2.2 to 5.9 Psi).

Oil Level Gage

The oil level gage is located towards the front RH side of the oil pan. Two holes in the end of the gage indicate the minimum and maximum oil levels. There is a difference of approximately 1 liter (1 US quart) between the 2 levels.

EXHAUST MANIFOLD



E79910

Item	Part Number	Description
A	-	LH exhaust manifold
B	-	RH exhaust maniflod
1	-	Connection for turbocharger
2	-	Connection for exhaust system
3	-	Connection for EGR cooling inlet

The cast iron exhaust manifolds are unique for each cylinder bank. They are sealed to the cylinder head by means of a steel gasket. Sacrificial plastic sleeves are used to align the manifolds. These sleeves must be changed when refitting the manifolds. Spacers on the securing bolts allow the manifolds to expand and retract with changes of temperature while maintaining the clamping loads.

Each manifold has a connection for the EGR cooling inlet pipe.

The engine is fitted with 2 electronically controlled Variable Geometry Turbochargers (VGT), which are fixed to the exhaust manifold by a 3-hole flange with a steel gasket.

Diagnosis and Testing

Overview

As diagnosis of the different areas of the engine is covered in other sections and by general procedures, this section is limited to an oil pressure test and the active engine mount system.

For specific areas of the engine, refer to the general procedures in this section and the relevant section of the manual.

Inspection and Verification (general)

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
● Engine oil level ● Coolant level ● Transmission fluid level ● Fuel level ● Coolant leaks ● Oil leaks ● Fuel leaks ● Visibly damaged or worn parts ● Loose or missing nuts or bolts ● Fuel contamination/grade/quality ● Sensor fitment/condition ● Viscous fan and solenoid ● Active engine mounts, correct fitment/damage ● Routing of pipework etc to avoid vibrations ● Contact anywhere between the driveline and chassis	● Fuses - Fuse 3E, engine compartment box ● Wiring harness ● Electrical connector(s) ● Injectors ● Glow plugs ● Active engine mounts ● 5 volt sensor supply ● Sensor(s) ● Viscous fan solenoid ● Engine control module (ECM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
   - Make sure that all DTCs are cleared following rectification.

Inspection and Verification (active engine mounts)

1. **1.** Verify the customer concern.
   - If the customer concern is of a vibration at **other** than idle speed, then the fault is **not** with the active engine mounts.
2. **2.** Use the approved diagnostic system or a scan tool to retrieve any fault codes, as other causes of vibration or misfire should be eliminated before condemning an active engine mount.
3. **3.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
● Active engine mounts, correct fitment/damage ● Routing of pipework etc to avoid vibrations ● Contact anywhere between the driveline and chassis	● Fuse 3E, engine compartment box ● Harnesses/connectors ● Active engine mounts ● Engine control module (ECM)

4. **4.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding.
5. **5.** If any non-engine-mount DTCs were present in the steps above, make sure their causes are rectified before beginning any work on the active engine mounts.
   - Make sure that all DTCs are cleared following rectification.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: For a full list of engine control module (ECM) DTCs.
REFER to: Electronic Engine Controls (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Diagnosis and Testing).

DTC	Description	Possible cause	Action
P0A1413	Engine mount control circuit A open	● Engine mount control circuit: high resistance ● Engine mount fault	Check the engine mounts and circuits. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.
P0A1511	Engine mount control circuit A low	● Engine mount control circuit: short circuit to ground ● Engine mount fault	Check the engine mounts and circuits. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.
P0A1612	Engine mount control circuit A high	● Engine mount control circuit: short circuit to power ● Engine mount fault	Check the engine mounts and circuits. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.
P0AB613	Engine mount control circuit B open	● Engine mount control circuit: high resistance ● Engine mount fault	Check the engine mounts and circuits. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.
P0AB711	Engine mount control circuit B low	● Engine mount control circuit: short circuit to ground ● Engine mount fault	Check the engine mounts and circuits. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.
P0AB812	Engine mount control circuit B high	● Engine mount control circuit: short circuit to power ● Engine mount fault	Check the engine mounts and circuits. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.

Oil Pressure check

• NOTE: Prior to checking the engine oil pressure, a road test of 6 miles (10 kilometers), must be carried out. Do not attempt to attain engine normal operating temperature by allowing the engine to idle.

1. • WARNINGS:

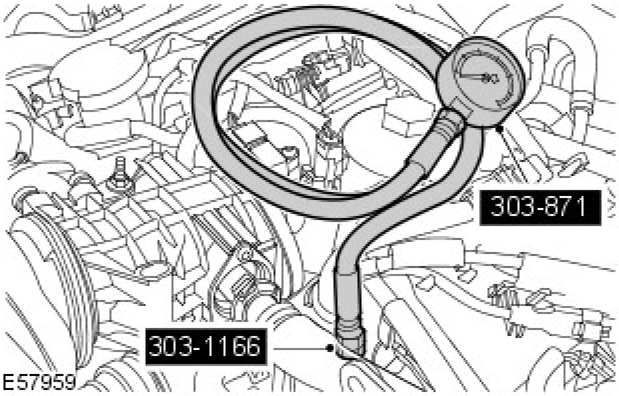
   ⚠ The spilling of hot engine oil is unavoidable during this procedure, care must be taken to prevent scalding. Failure to follow this instruction may result in personal injury.

   ⚠ Wear protective gloves.

   1. Remove the oil pressure sensor.
   REFER to: Engine Oil Pressure (EOP) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation).

2. **2.** Install the special tool to the oil filter housing.

3. **3.** Install the special tool gauge and tighten the union.



4. **4.** Check and top-up the engine oil, if required.
5. **5.** Start and run the engine.
6. **6.** Note the oil pressure readings with the engine running at idle and at 3,500 rpm.
   REFER to: Specifications (303-01D Engine - TDV8 3.6L Diesel, Specifications).
7. **7.** Turn off the engine.
8. **8.** Remove the special tools.
9. **9.** Install the oil pressure sensor.
   REFER to: Engine Oil Pressure (EOP) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation).
10. **10.** Check and top-up the engine oil, if required.

Engine - TDV8 3.6L Diesel - Engine Oil Draining and Filling

General Procedures

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

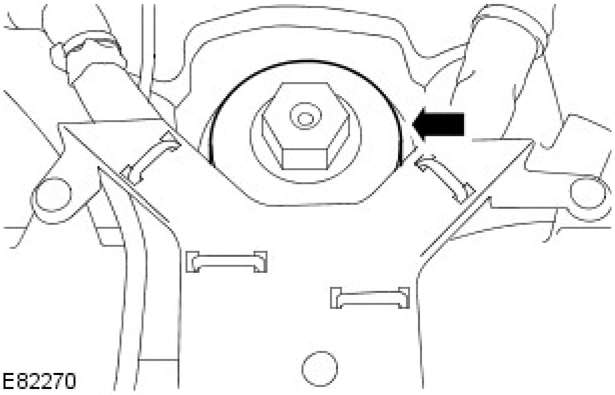
Raise and support the vehicle.

3. Remove the engine cover.
For additional information, refer to: Engine Cover - TDV8 3.6L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

4. Loosen the oil filter cover 3 turns and allow the engine oil to drain.

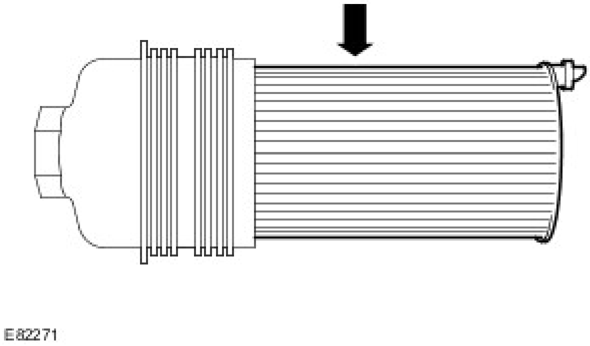
5. NOTE: Position cloth to collect fluid spillage.

Remove the oil filter cover and oil filter element.

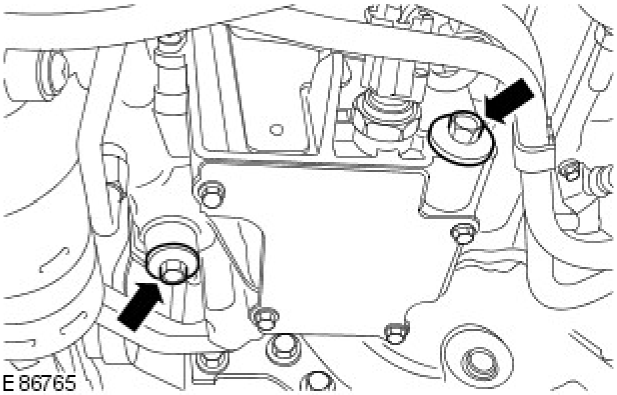


6. Remove and discard the oil filter element.

- Remove and discard the oil filter cover O-ring seal.



7. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).



8. Drain the engine oil.

- Position a container to collect the engine oil.
- Remove and discard the 2 drain plugs.
- Allow the engine oil to drain.

9. Install the new drain plugs.

- Clean the component mating faces.
- Tighten the drain plugs to 23 Nm (17 lb.ft).
- Remove the container.

10. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

11. Install a new oil filter cover O-ring seal.

- Clean the components.
- Lubricate the O-ring seal with clean engine oil.

12. Install a new oil filter element to the oil filter cover.

- Lubricate the oil filter element O-ring seal with clean engine oil.

13. Install the oil filter cover and oil filter element.

- Tighten the oil filter cover to 35 Nm (26 lb.ft).

14. Fill the engine with the recommended oil to the correct level.

15. Install the engine cover.
For additional information, refer to: Engine Cover - TDV8 3.6L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

16. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

17. Check and top-up the engine oil.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the body.
For additional information, refer to: Body - TDV8 3.6L Diesel (502-02 Full Frame and Body Mounting, Removal and Installation).

4. Remove the LH camshafts.
For additional information, refer to: Camshaft LH (303-01D Engine - TDV8 3.6L Diesel, In-vehicle Repair).

5. Remove the LH exhaust gas recirculation (EGR) valve and cooler assembly.
For additional information, refer to: Exhaust Gas Recirculation (EGR) Valve LH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation).

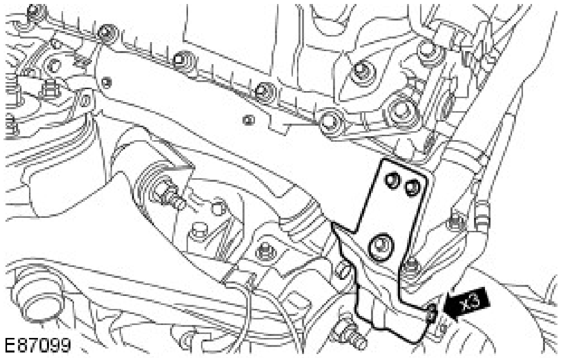
6. Remove the LH EGR valve inlet tube.

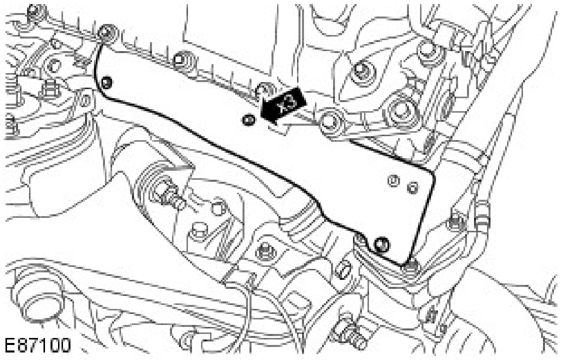
- Remove the 3 bolts.
- Remove and discard the gasket.



E87099

7. Remove the LH turbocharger heat shield.

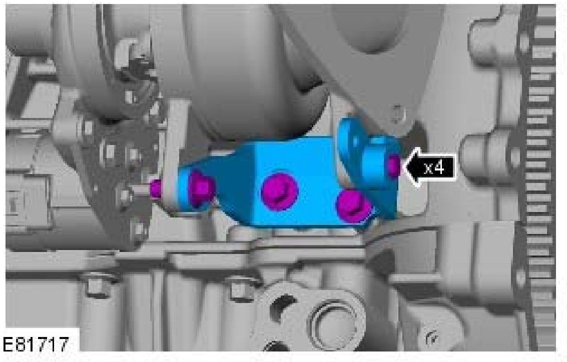
- Remove the 3 bolts.



E87100

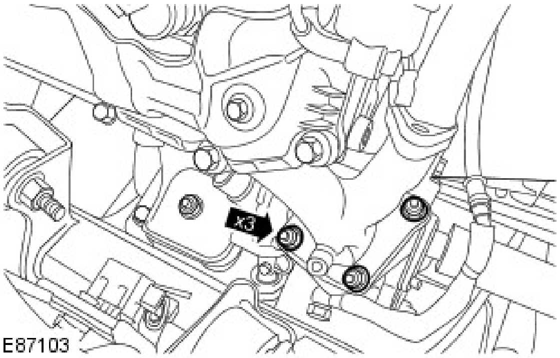
8. Remove the LH exhaust manifold heat shield.

- Remove the 3 bolts.



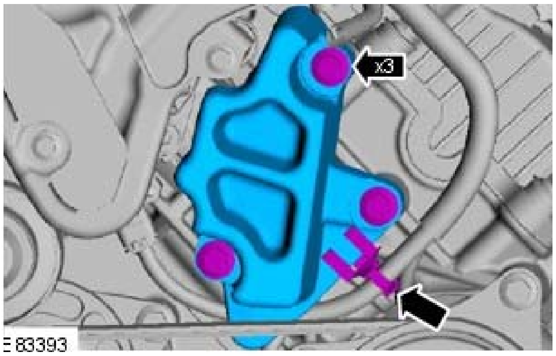
9. Loosen the turbocharger support bracket.

- Loosen the 4 bolts.



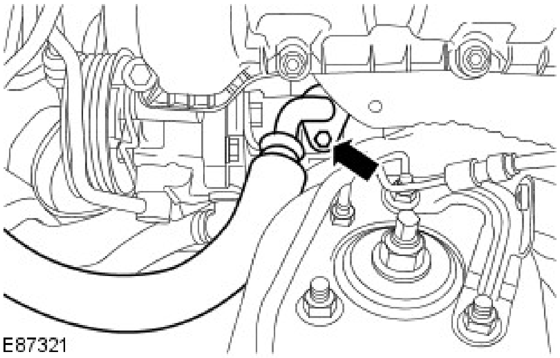
10. Release the LH turbocharger.

- Remove and discard the 3 nuts.



11. Remove the fuel pump crash protector.

- Release the engine wiring harness.
- Remove the 3 bolts.



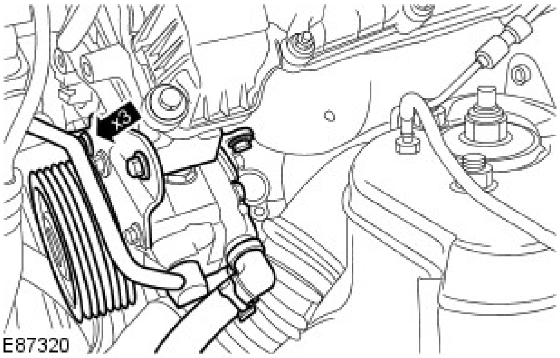
12. CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Disconnect the air conditioning (A/C) compressor low-pressure refrigerant line.

- Remove the bolt.
- Remove and discard the O-ring seal.

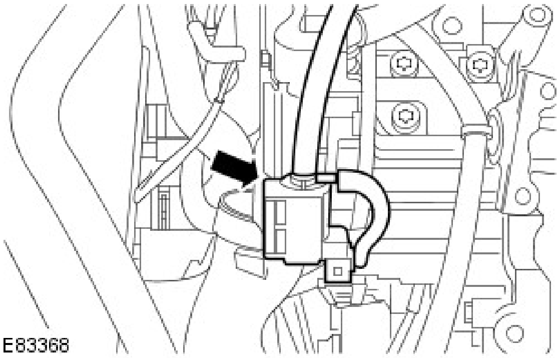
13. Release the cooling fan belt from the power steering pump pulley.

- Release the tension from the belt.

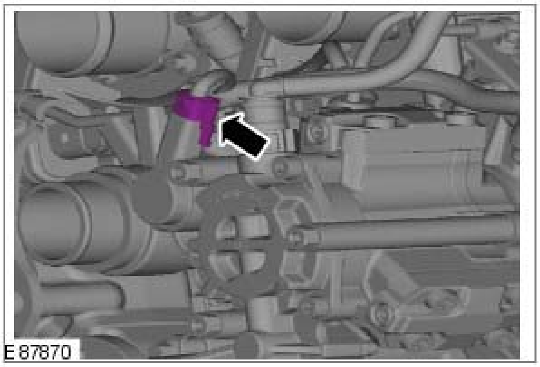


14. Release the power steering pump and mounting bracket.

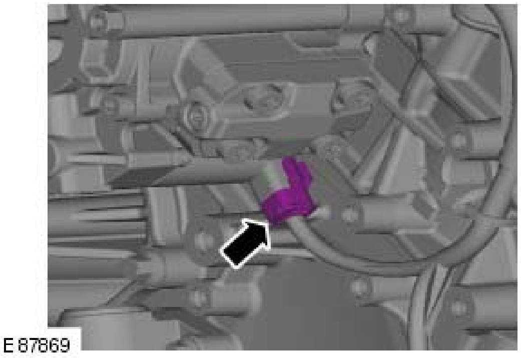
- Remove the 3 bolts.



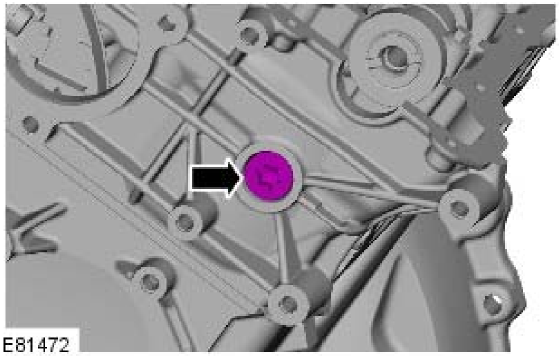
15. Release the vacuum solenoid.



16. Disconnect the fuel pressure regulator electrical connector.

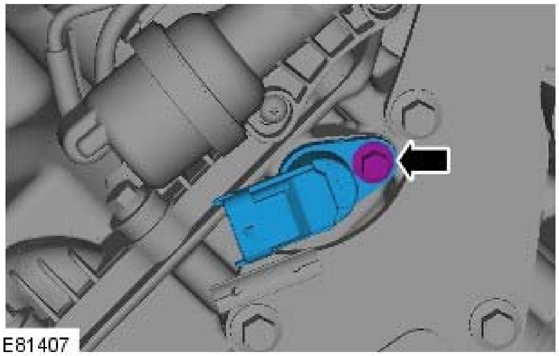


17. Disconnect the fuel metering valve electrical connector.



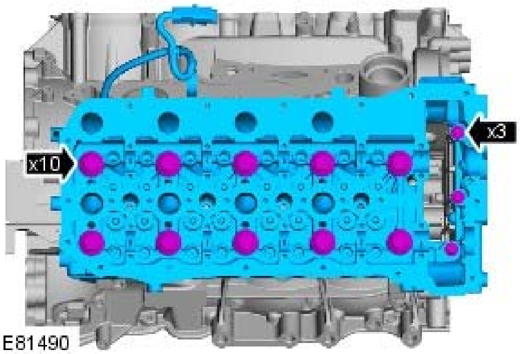
18. Remove the LH timing chain tensioner guide pin.

- Remove and discard the O-ring seal.



19. Remove the camshaft position (CMP) sensor.

- Remove the bolt.
- Remove and discard the O-ring seal.



20. CAUTIONS:

⚠ The cylinder head must not be placed mating face down. Failure to follow this instruction may result in damage to the vehicle.

⚠ Make sure that no damage occurs to the timing chain and timing chain guides.

With assistance, remove the cylinder head assembly.

- Remove and discard the 13 bolts.
- Remove and discard the gasket.

21. Remove and discard the turbocharger gasket.

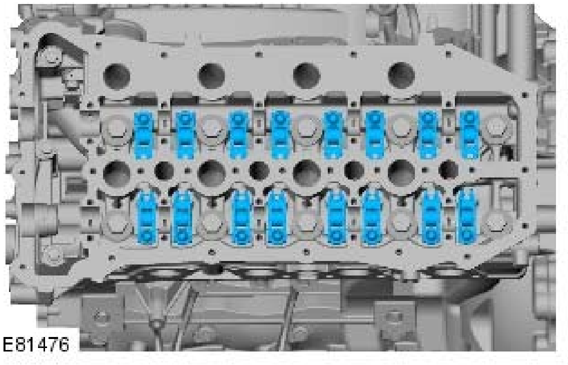
22. NOTE: Do not disassemble further if the component is removed for access only.

Remove the fuel pump.

- Remove the 3 bolts.
- Remove and discard the gasket.

23. Remove the exhaust manifold.

- Remove and discard the 8 nuts.
- Remove and discard the gasket.



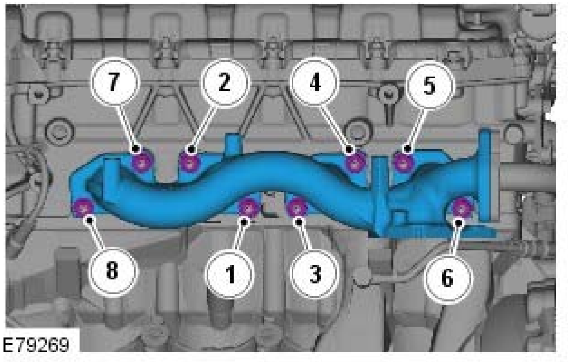
24. Remove the hydraulic adjuster and rocker assemblies.

Installation

1. NOTE: Make sure that all the components are clean.

• NOTE: Lubricate the hydraulic adjuster and rocker assemblies with clean engine oil.

Install the hydraulic adjuster and rocker assemblies.



2. ⚠CAUTION: To make sure that the exhaust manifold is correctly installed and the exhaust manifold nuts are correctly torqued, it is critical that the tightening torque is checked 2 further times after the initial torque has been applied.

• NOTE: Tighten the nuts in the sequence shown.

Install the exhaust manifold.

- Install the new gasket.
- Clean the component mating face.
- Stage 1: Tighten the new nuts to 23 Nm (17 lb.ft).
- Stage 2: Wait for 2 minutes and tighten the nuts to 23 Nm (17 lb.ft).
- Stage 3: Wait for 2 minutes and tighten the nuts to 23 Nm (17 lb.ft).

3. Install the fuel pump.

- Clean the component mating faces.
- Install a new gasket.
- Apply loctite 572 to the fuel pump bolt threads.
- Loosely install the bolts.

4. Install a new turbocharger gasket.

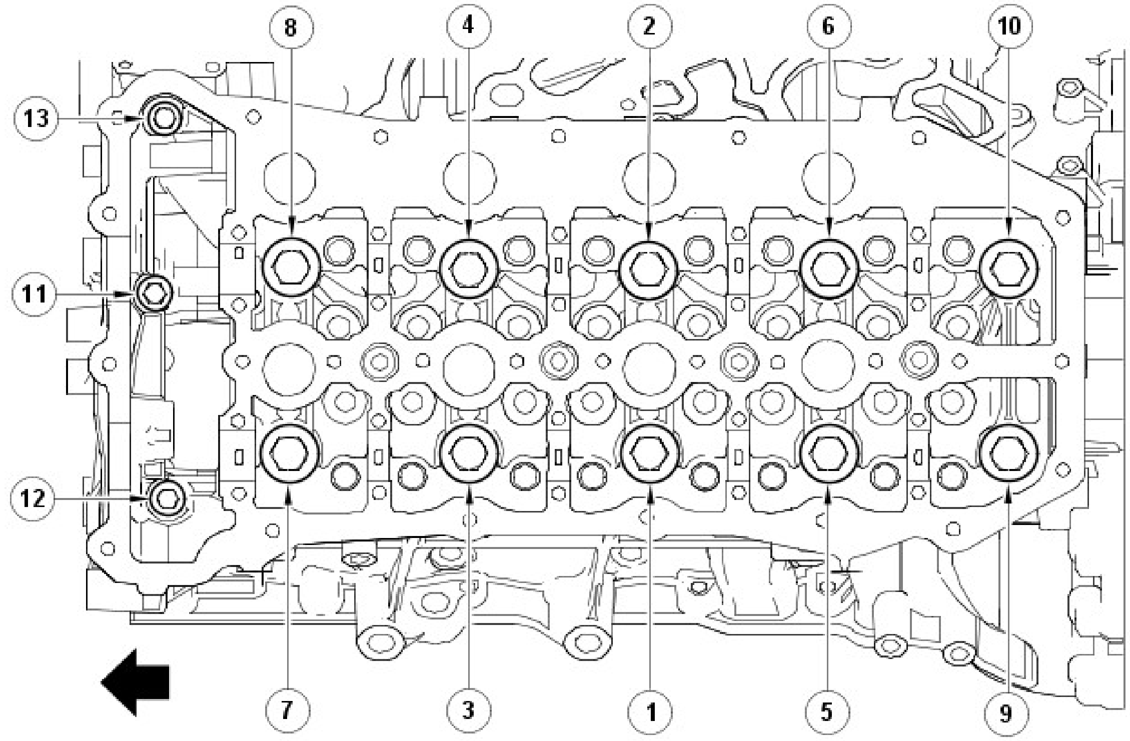
- Clean the components mating faces.

5. NOTE: The cylinder head gasket must be installed over the cylinder head to cylinder block dowels.

Install a new LH cylinder head gasket.

- Clean the component mating face.

6. Check cylinder head face for distortion, across the center and from corner to corner.



E83621

7. CAUTIONS:

⚠ Tighten the bolts in the sequence shown.

⚠ Use care when installing the cylinder head. Damage to the cylinder block, cylinder head or cylinder head gasket may result.

⚠ Make sure that no damage occurs to the timing chain and timing chain guides.

• NOTE: Make sure the cylinder head is installed in its original position.

With assistance, install the cylinder head assembly.

- Clean the component mating faces.
- Stage 1: Tighten the M13 bolts to 20 Nm (15 lb.ft).
- Stage 2: Tighten the M13 bolts to 40 Nm (30 lb.ft).
- Stage 3: Tighten the M13 bolts to 80 Nm (59 lb.ft).
- Stage 4: Tighten the M13 bolts a further 180 degrees.
- Stage 5: Tighten the M8 bolts to 20 Nm (15 lb.ft).

8. Install the CMP sensor.

- Install a new O-ring seal.
- Tighten the bolt to 10 Nm (7 lb.ft).

9. NOTE: Lubricate the O-ring seal with clean engine oil.

Install the LH timing chain tensioner guide pin.

- Install a new O-ring seal.
- Tighten to 28 Nm (21 lb.ft).

10. Connect the fuel metering valve electrical connector.

11. Connect the fuel pressure regulator electrical connector.

12. Secure the vacuum solenoid.

13. Secure the power steering pump and mounting bracket.

- Tighten the bolts to 23 Nm (17 lb.ft).

14. NOTE: Make sure that the cooling fan belt is correctly located on each pulley.

Secure the cooling fan belt around the power steering pump pulley.

15. NOTE: Remove and discard the blanking caps.

Connect the A/C compressor low-pressure refrigerant line.

- Install a new O-ring seal.
- Install the bracket.
- Tighten the bolt to 23 Nm (17 lb.ft).

16. Install the fuel pump crash protector.

- Tighten the bolts to 23 Nm (17 lb.ft).
- Secure the engine wiring harness.

17. ⚠ WARNING: Make sure that new nuts are installed.

Secure the LH turbocharger.

- Tighten the nuts to 24 Nm (18 lb.ft).

18. Secure the LH turbocharger support bracket.

- Stage 1: Tighten the LH turbocharger support bracket bolts at the turbocharger to 24 Nm (18 lb.ft).
- Stage 2: Tighten the LH turbocharger support bracket bolts at the cylinder block to 24 Nm (18 lb.ft).

19. Check tightness of the turbocharger nuts.

- Tighten the nuts to 24 Nm (18 lb.ft).

20. Install the LH exhaust manifold heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

21. Install the LH turbocharger heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

22. Install the LH EGR valve inlet tube.

- Clean the component mating faces.
- Install a new gasket.
- Tighten the bolts to 10 Nm (7 lb.ft).

23. Install the LH EGR valve and cooler assembly.

For additional information, refer to: Exhaust Gas Recirculation (EGR) Valve LH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation).

24. Install the LH camshafts.
For additional information, refer to: Camshaft LH (303-01D Engine - TDV8 3.6L Diesel, In-vehicle Repair).

25. Install the body.
For additional information, refer to: Body - TDV8 3.6L Diesel (502-02 Full Frame and Body Mounting, Removal and Installation).

26. Connect the battery ground cable.

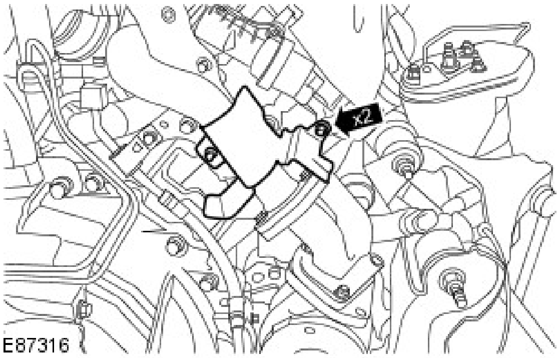
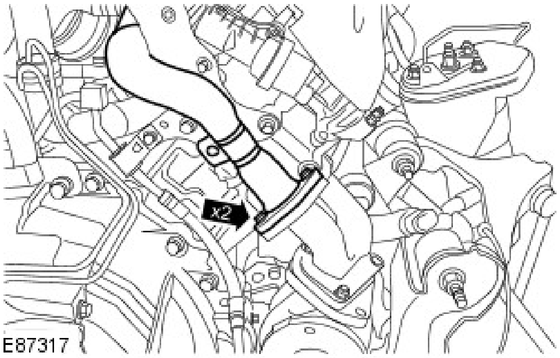
5. Remove the RH exhaust gas recirculation (EGR) valve and cooler assembly.
For additional information, refer to: Exhaust Gas Recirculation (EGR) Valve RH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation).



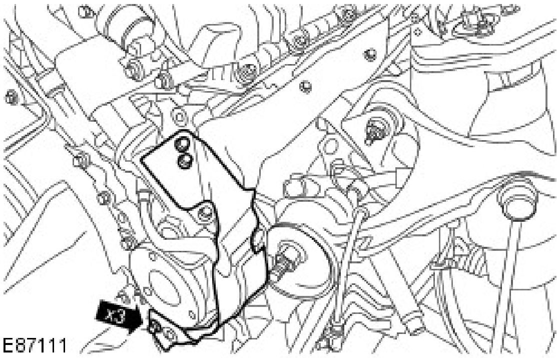
6. Remove the RH EGR valve inlet tube heat shield.

- Remove the 2 bolts.



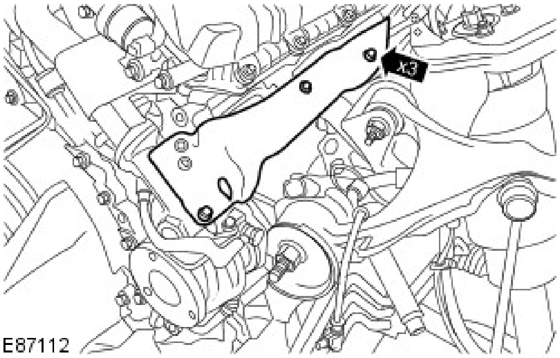
7. Remove the RH EGR valve inlet tube.

- Remove the 2 bolts.
- Remove and discard the gasket.



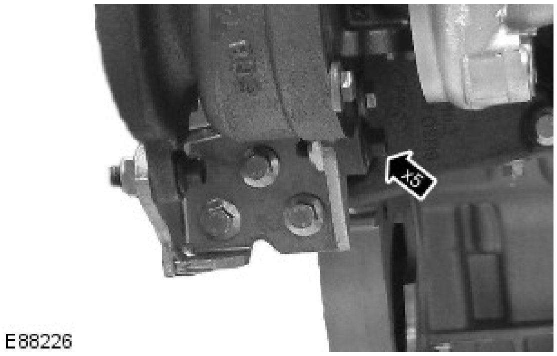
8. Remove the RH turbocharger heat shield.

- Remove the 3 bolts.



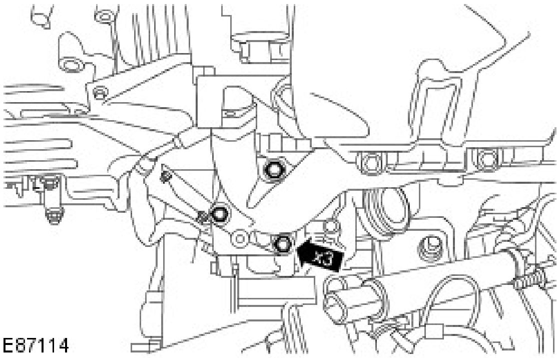
9. Remove the RH exhaust manifold heat shield.

- Remove the 3 bolts.



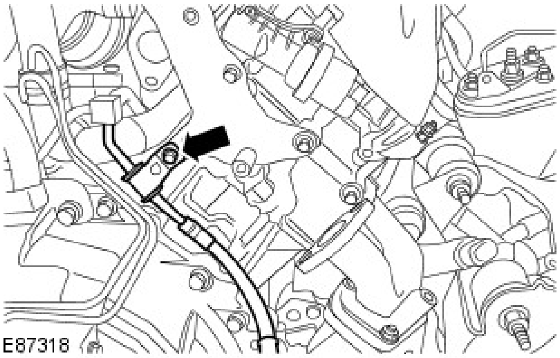
10. Loosen the turbocharger support bracket.

- Loosen the 5 bolts.



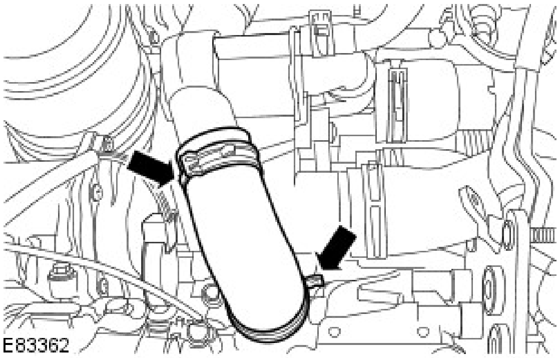
11. Release the RH turbocharger.

- Remove and discard the 3 nuts.



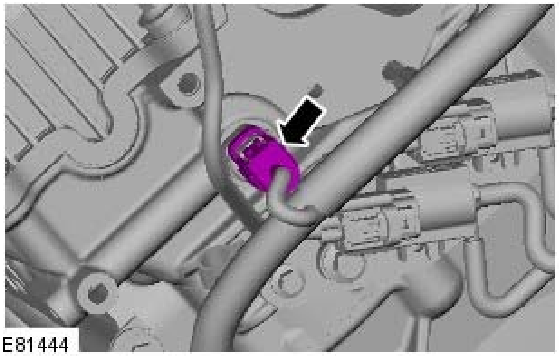
12. Release the turbocharger oil feed pipe.

- Remove the bolt.

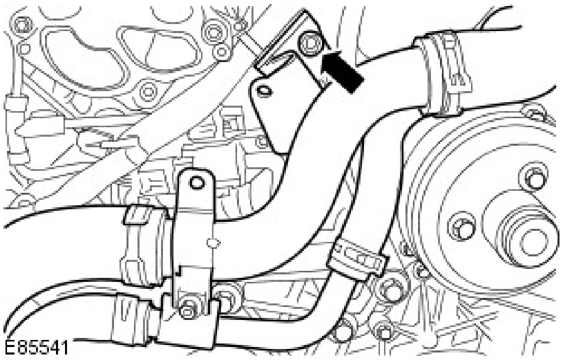


13. Remove the RH cylinder head coolant elbow.

- Release the 2 clips.

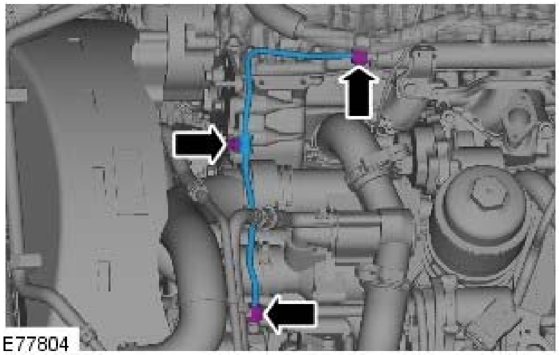


14. Disconnect the engine oil pressure (EOP) sensor electrical connector.



15. Release the coolant hose bracket.

- Remove the nut.



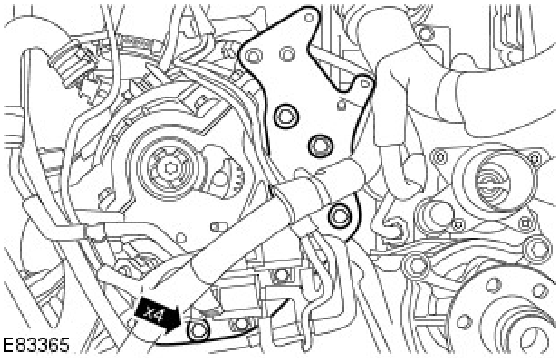
16. CAUTIONS:

⚠ Make sure that all openings are sealed. Use new blanking caps.

⚠ Do not allow the unions to hit the olive ends of the high-pressure fuel supply line as this may damage the ends of the line and allow foreign matter to enter the fuel injection system.

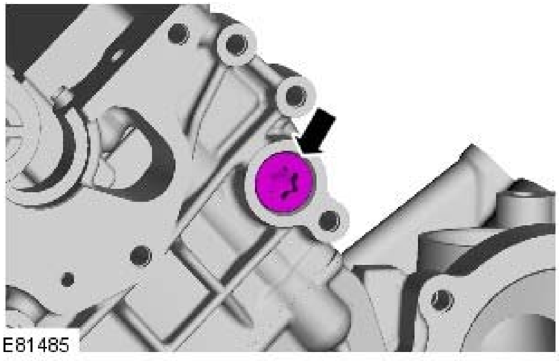
Remove and discard the high-pressure fuel rail supply line.

- Release the clip.



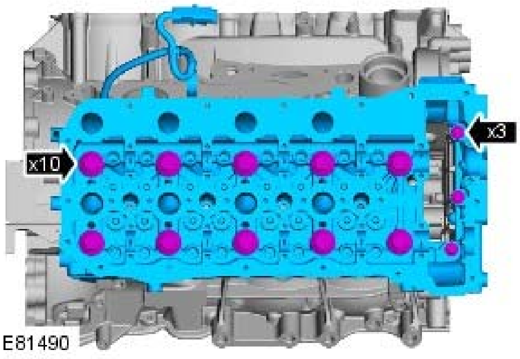
17. Release the engine lifting eye bracket.

- Remove the 4 bolts.



18. Remove the RH timing chain tensioner guide pin.

- Remove and discard the O-ring seal.



19. CAUTIONS:

⚠ The cylinder head must not be placed mating face down. Failure to follow this instruction may result in damage to the vehicle.

⚠ Make sure that no damage occurs to the timing chain and timing chain guides.

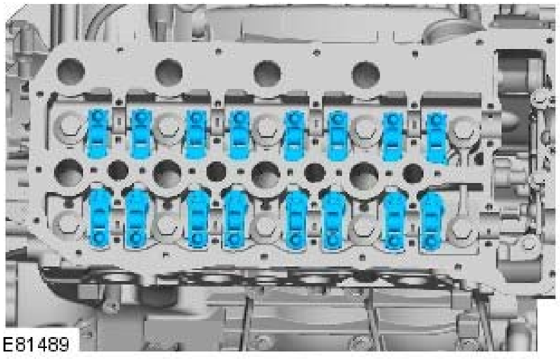
With assistance remove the cylinder head assembly.

- Remove the 13 bolts.
- Remove and discard the gasket.

20. Remove and discard the turbocharger gasket.

21. NOTE: Do not disassemble further if the component is removed for access only.

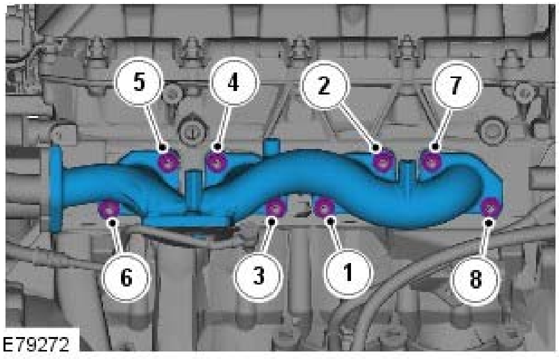
Remove the hydraulic adjuster and rocker assemblies.



22. Remove the exhaust manifold.

- Remove and discard the 8 nuts.
- Remove and discard the gasket.

Installation



1. CAUTION: To make sure that the exhaust manifold is correctly installed and the exhaust manifold nuts are correctly torqued, it is critical that the tightening torque is checked 2 further times after the initial torque has been applied.

• NOTE: Tighten the nuts in the sequence shown.

- Stage 3: Wait for 2 minutes and tighten the nuts to 23 Nm (17 lb.ft).

2. NOTE: Make sure that all the components are clean.

• NOTE: Lubricate the hydraulic adjuster and rocker assemblies with clean engine oil.

Install the hydraulic adjuster and rocker assemblies.

3. Install a new turbocharger gasket.

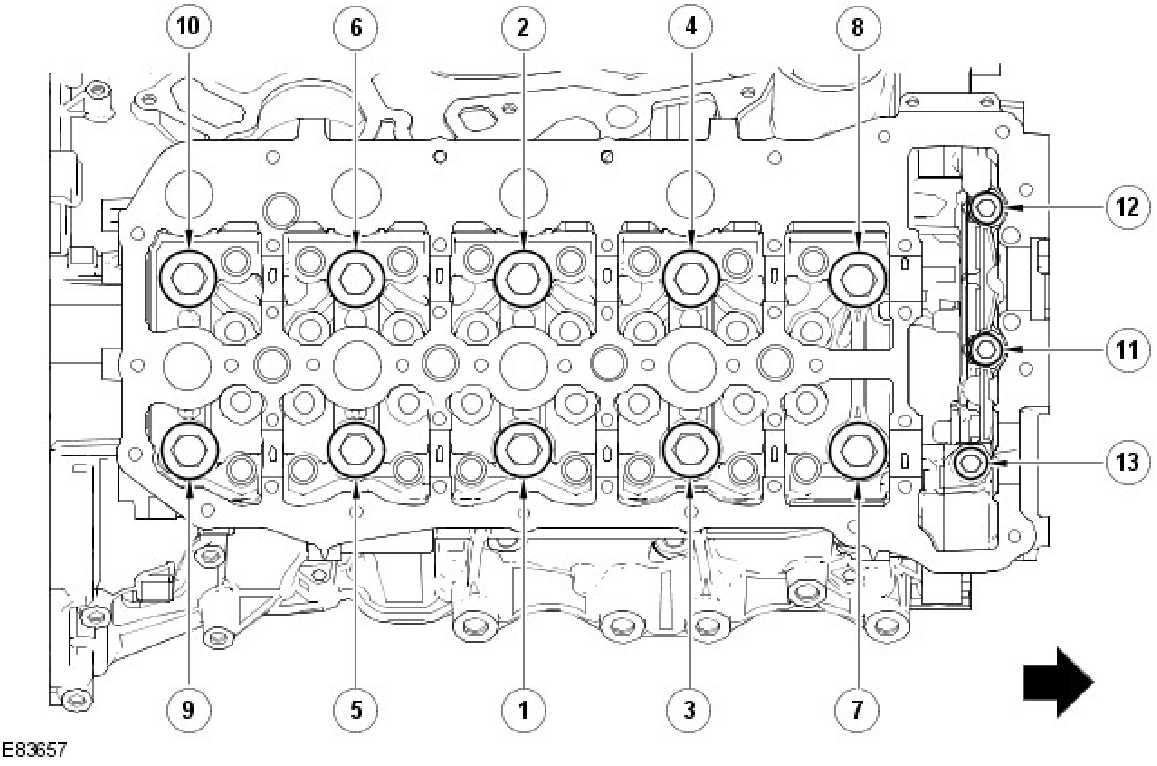
- Clean the components mating faces.

4. NOTE: The cylinder head gasket must be installed over the cylinder head to cylinder block dowels.

Install a new RH cylinder head gasket.

- Clean the component mating face.

5. Check cylinder head face for distortion, across the center and from corner to corner.



6. CAUTIONS:

Tighten the bolts in the sequence shown.

Use care when installing the cylinder head. Damage to the cylinder block, cylinder head or cylinder head gasket may result.

Make sure that no damage occurs to the timing chain and timing chain guides.

• NOTE: Make sure the cylinder head is installed in its original position.

With assistance install the cylinder head assembly.

- Clean the

component mating faces.

- Stage 1: Tighten the M13 bolts to 20 Nm (15 lb.ft).
- Stage 2: Tighten the M13 bolts to 40 Nm (30 lb.ft).
- Stage 3: Tighten the M13 bolts to 80 Nm (59 lb.ft).
- Stage 4: Tighten the M13 bolts a further 180 degrees.
- Stage 5: Tighten the M8 bolts to 20 Nm (15 lb.ft).

7. NOTE: Lubricate the O-ring seal with clean engine oil.

Install the RH timing chain tensioner guide pin.

- Install a new O-ring seal.
- Tighten to 28 Nm (21 lb.ft).

8. Secure the engine lifting eye bracket.

- Tighten the bolts to 25 Nm (18 lb.ft).

9. CAUTIONS:

⚠ Do not allow the unions to hit the olive ends of the high-pressure fuel supply line as this may damage the ends of the line and allow foreign matter to enter the fuel injection system.

⚠ Maintain pressure on the high-pressure fuel supply line to keep the olives in contact with the fuel rail and the fuel injection pump cones while installing unions.

• NOTE: Remove and discard the blanking caps.

Install the new high-pressure fuel rail supply line.

- Stage 1: Tighten the high-pressure fuel supply line union at the fuel injection pump to 15 Nm (11 lb.ft).
- Stage 2: Tighten the high-pressure fuel supply line union at the fuel rail to 15 Nm (11 lb.ft).
- Stage 3: Tighten the high-pressure fuel supply line union at the fuel injection pump to 30 Nm (22 lb.ft).
- Stage 4: Tighten the high-pressure fuel supply line union at the fuel

rail to 30 Nm (22 lb.ft).

- Tighten the clip to 10 Nm (7 lb.ft).

10. Secure the coolant hose support bracket.

- Tighten the nut to 9 Nm (7 lb.ft)

11. Connect the EOP sensor electrical connector.

12. Install the RH cylinder head coolant elbow.

- Secure with the 2 clips.

13. Secure the turbocharger oil feed pipe.

- Tighten the bolt to 10 Nm (7 lb.ft).

14. WARNING: Make sure that new nuts are installed.

Secure the RH turbocharger.

- Tighten the nuts to 24 Nm (18 lb.ft).

15. Secure the RH turbocharger support bracket.

- Stage 1: Tighten the LH turbocharger support bracket bolts at the turbocharger to 24 Nm (18 lb.ft).
- Stage 2: Tighten the LH turbocharger support bracket bolts at the cylinder block to 24 Nm (18 lb.ft).

16. Check tightness of the turbocharger nuts.

- Tighten the nuts to 24 Nm (18 lb.ft).

17. Install the RH exhaust manifold heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

18. Install the RH turbocharger heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

19. Install the RH EGR valve inlet tube.

- Clean the component mating faces.
- Install a new gasket.
- Tighten the bolts to 10 Nm (7 lb.ft).

20. Install the RH EGR valve inlet tube heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

21. Install the RH EGR valve and cooler assembly.

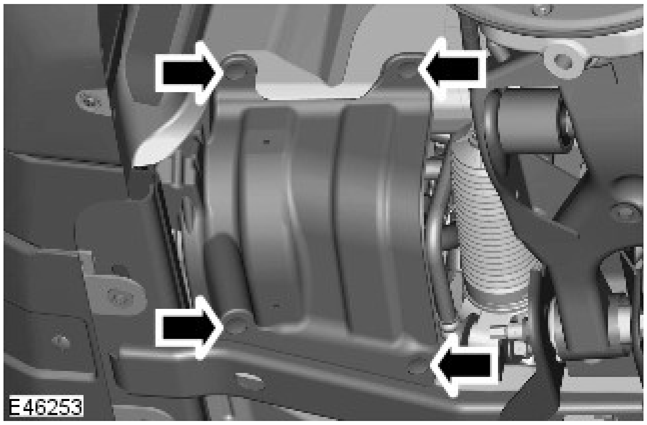
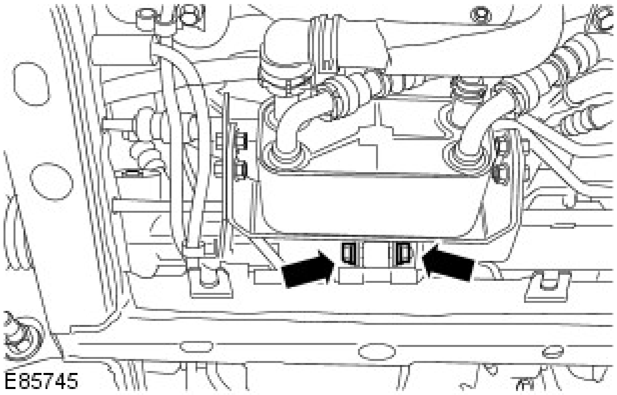
11. Release the engine ground cable.

- Remove the nut.



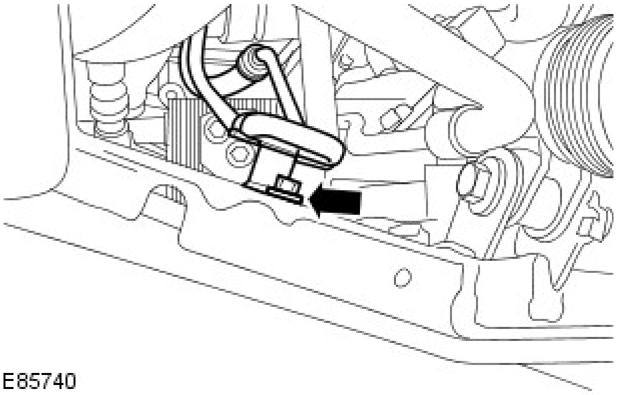
12. Remove the front LH splash shield.

- Remove the 4 clips.



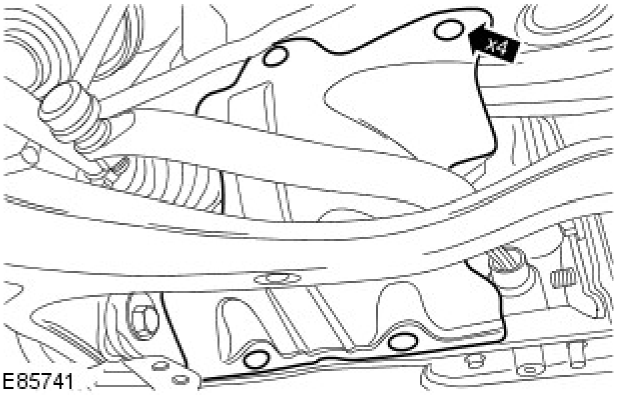
13. Release the engine stabilizer.

- Remove the nut and bolt.



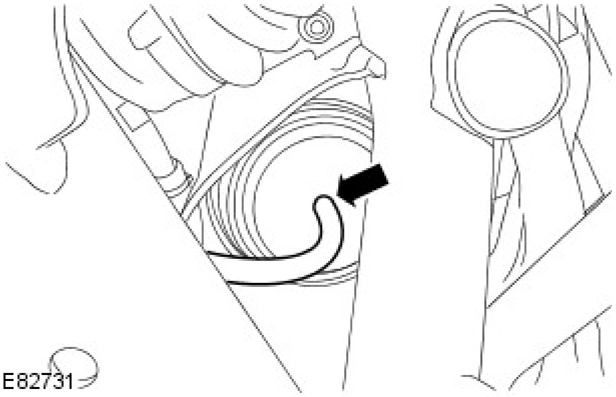
14. Release the power steering line support bracket.

- Remove the bolt.

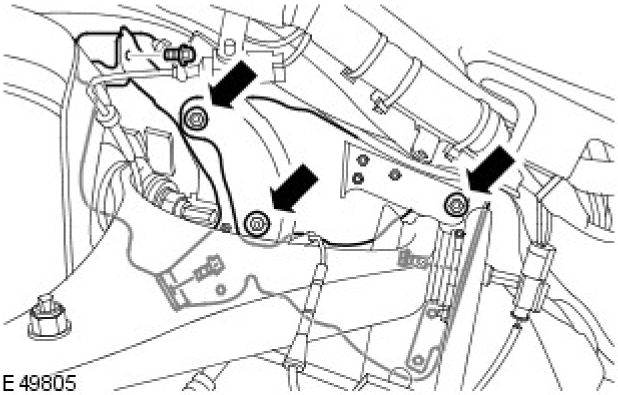


15. Remove the LH splash shield.

- Remove the 4 clips.



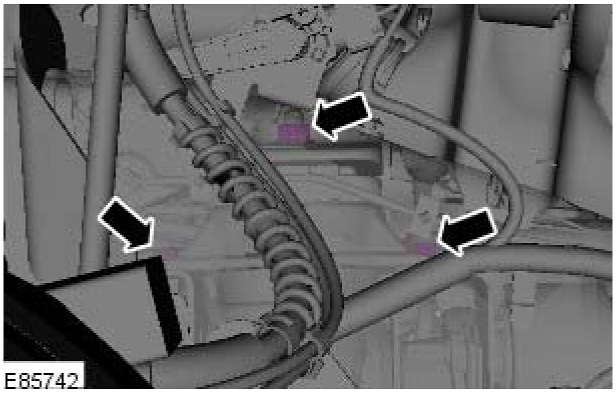
16. Disconnect the LH engine mount vacuum line.



17. NOTE: The heat shield consists of 3 parts.

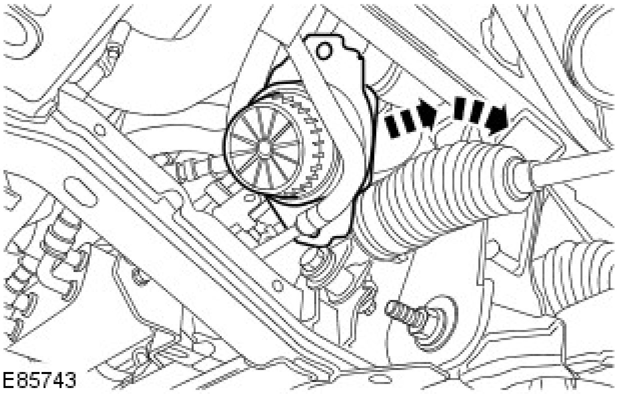
Remove the upper suspension arm and brake line heat shields for access.

- Remove the 3 nuts.
- Remove the 3 bolts.
- Remove the bracket.



18. Release the LH engine mount.

- Remove the 2 bolts.
- Remove the nut.
- Using a suitable hydraulic jack, raise and support the engine.



19. Remove the LH engine mount.

Installation

1. Install the LH engine mount.

2. Secure the LH engine mount.

- Tighten the nut to 100 Nm (74 lb.ft).
- Tighten the bolts to 56 Nm (41 lb.ft).
- Lower the engine onto the mount.

3. Connect the LH engine mount vacuum line.

4. NOTE: The heat shield consists of 3 parts.

Install the upper suspension arm and brake line heat shields.

- Install the bolts.
- Install the nuts.
- Tighten to 6 Nm (4 lb.ft).

5. Install the LH splash shield.

- Install the clips.

6. Secure the power steering line support bracket.

- Tighten the bolt.

7. Secure the engine stabilizer.

- Tighten the nut and bolt to 115 Nm (85 lb.ft).

8. Install the front LH splash shield.

- Install the clips.

9. Secure the engine ground cable.

- Tighten the nut.

10. Install the front RH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

11. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

12. Install the cooling fan upper shroud.

- Secure in the clips.

13. Connect the charge air cooler outlet hoses.

- Tighten the clips.

14. Connect the auxiliary radiator coolant hose.

- Secure the clip.

15. Connect the radiator upper hose.

- Secure the clip.

16. Install the LH front wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

17. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

18. Fill and bleed the cooling system.

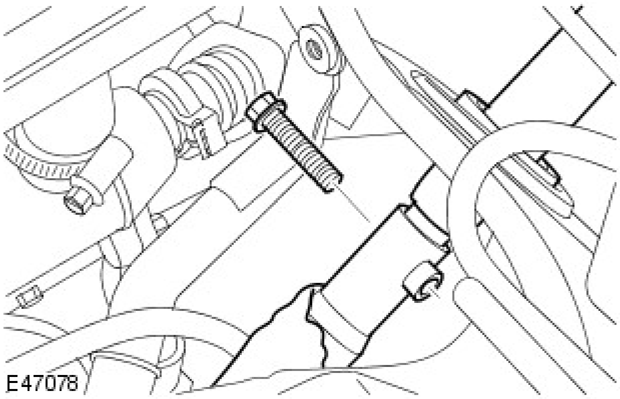
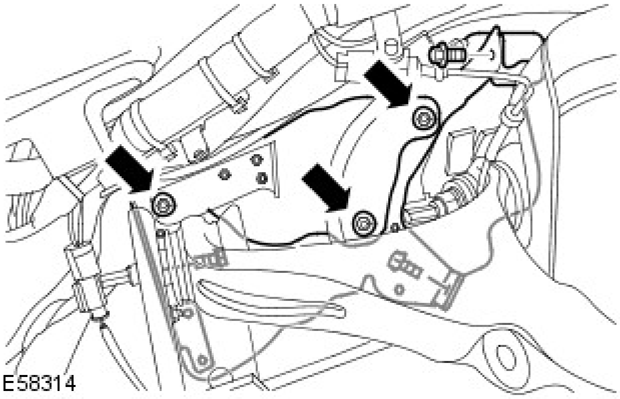
2. Remove the auxiliary battery tray.
For additional information, refer to: Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).

3. Raise and support the vehicle.



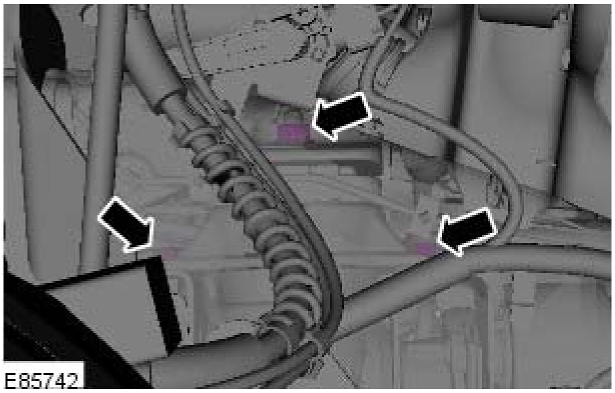
4. Disconnect the steering column lower shaft from the steering column.

- Remove and discard the bolt.



5. Remove the upper suspension arm and brake line heat shields for access.

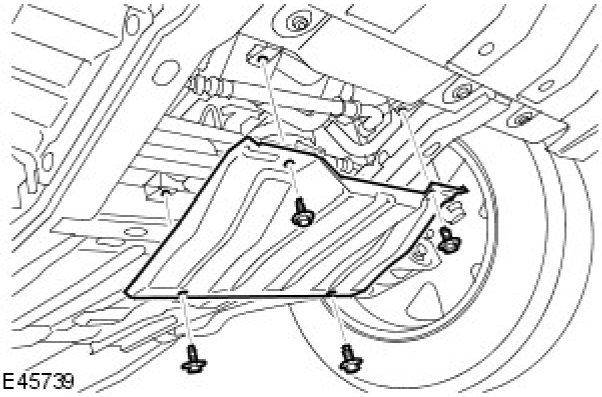
- Remove the 3 nuts.
- Remove the 3 bolts.
- Remove the heat shield bracket.



6. Release the RH engine mount.

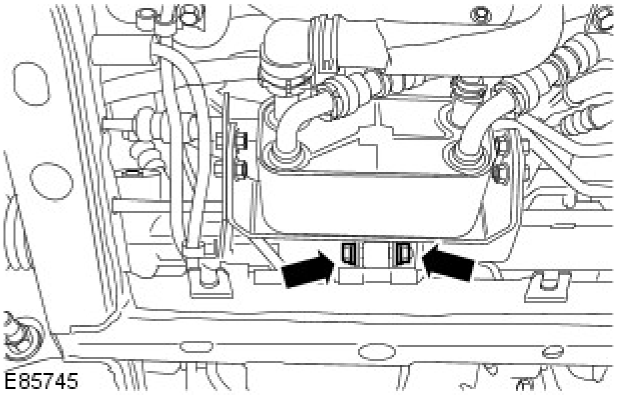
- Remove the nut.
- Remove the 2 bolts.

7. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).



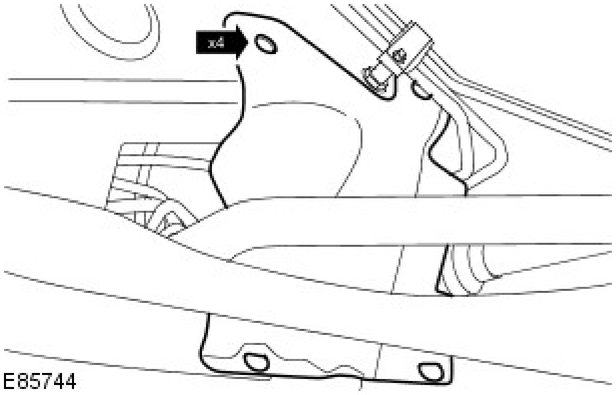
8. Remove the radiator splash shield.

- Remove the 4 bolts.



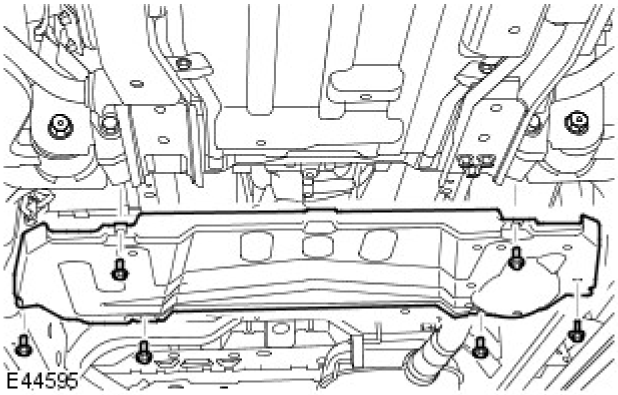
9. Release the engine stabilizer.

- Remove the nut and bolt.



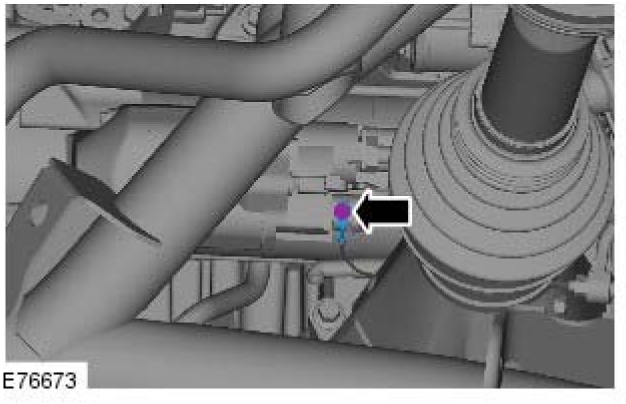
10. Remove the RH splash shield.

- Remove the 4 clips.



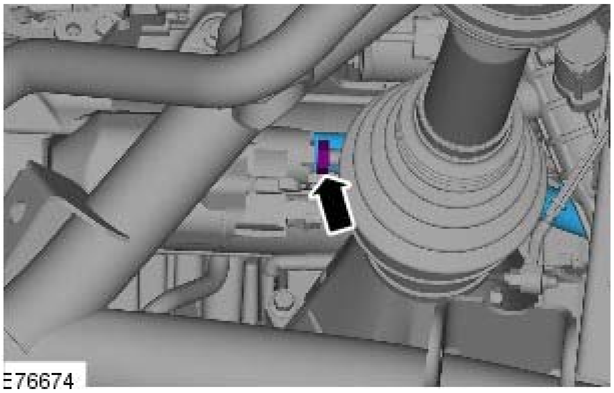
11. Remove the transmission undershield.

- Remove the 6 bolts.



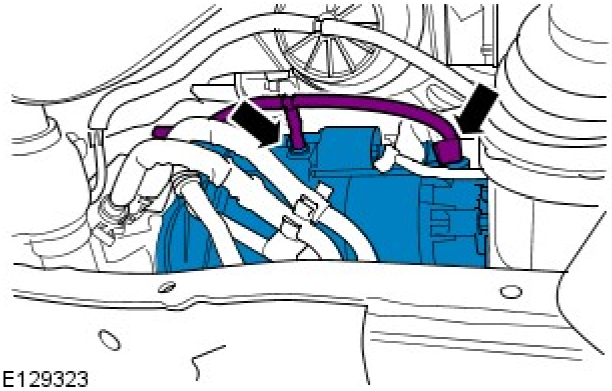
12. Disconnect the switch lead from the starter motor solenoid.

- Remove the bolt.



13. Disconnect the 2 battery positive cables from the starter motor solenoid.

- Remove the nut.

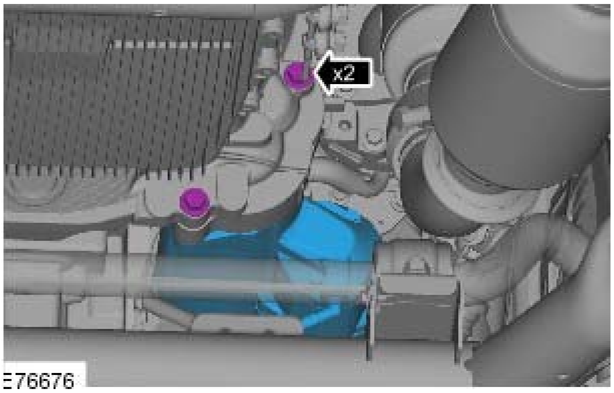


14. NOTE: Vehicles with snorkel installed.

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

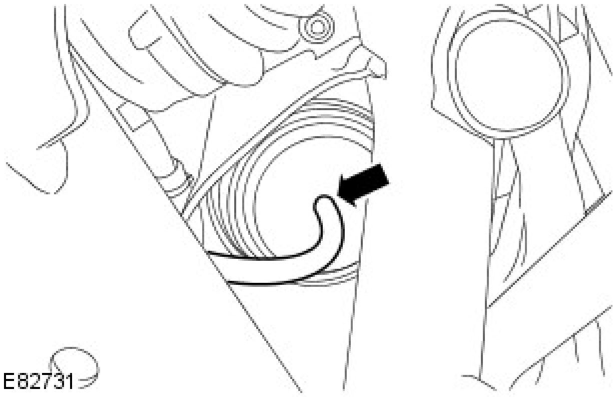
Disconnect the snorkel.

- Disconnect the 2 pipes.



15. Reposition the starter motor.

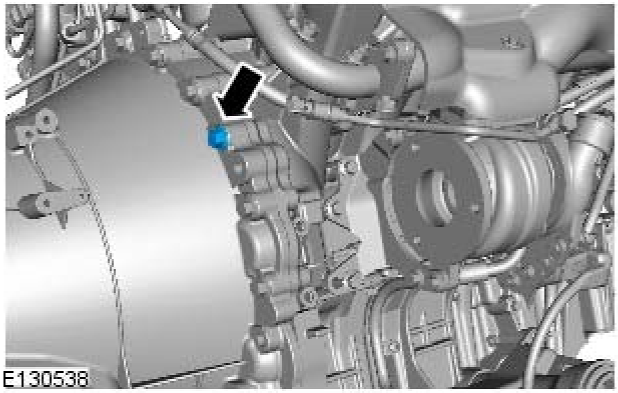
- Remove the 2 bolts.



16. Disconnect the RH engine mount vacuum line.

17. Remove the RH engine mount.

- Using a suitable hydraulic jack, raise and support the engine.

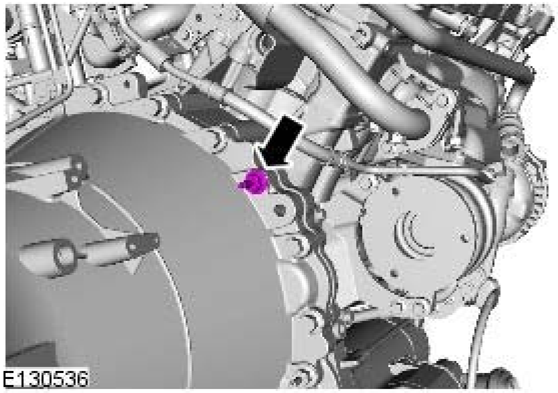


18. NOTE: Vehicles without snorkel installed.

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Remove and discard the bolt.

Installation



1. NOTE: Vehicles without snorkel installed.

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Install the stud.

- Tighten to 45 Nm (33 lb.ft)

2. Install the RH engine mount.

3. Connect the RH engine mount vacuum line.

4. Secure the starter motor.

- Clean the component mating faces.
- Tighten the bolts to 45 Nm (33 lb.ft).

5. Connect the battery positive cable.

- Tighten the nut to 22 Nm (16 lb.ft).

6. Connect the switch lead to the starter motor solenoid.

- Tighten the nut to 4 Nm (3 lb.ft).

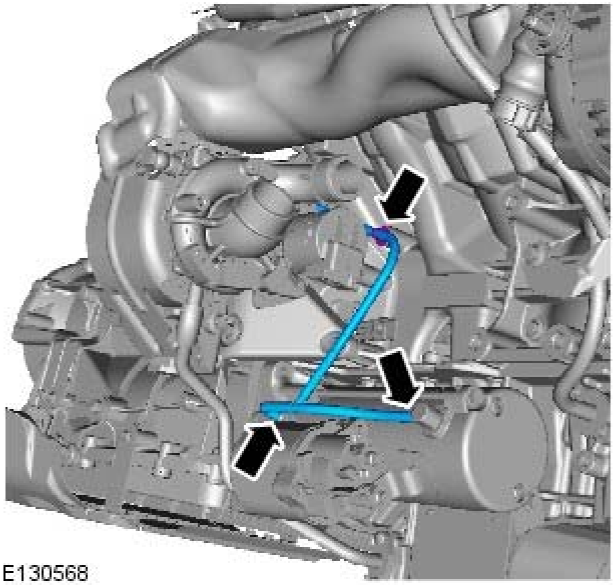
7. Route the snorkel tube as shown.

- Secure the clips.



E130568

8. Fit the snorkel tube to the starter motor.

- Connect the 2 snorkel tubes.
- Secure the clip.

9. Install the transmission undershield.

- Tighten the bolts to 10 Nm (7 lb.ft).

10. Secure the RH engine mount.

- Lower the engine.
- Tighten the nut to 100 Nm (74 lb.ft).
- Tighten the bolts to 56 Nm (41 lb.ft).

11. NOTE: The heatshield consists of 3 parts.

Install the upper suspension arm and brake line heat shields.

- Install the bolts.
- Install the nuts.

12. Install the RH splash shield.

- Install the clips.

13. Secure the engine stablizer.

- Tighten the nut and bolt to 40 Nm (30 lb.ft).

14. Install the radiator splash shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

15. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

16. ⚠ WARNING: Make sure that a new bolt is installed.

Connect the steering column lower shaft to the steering column.

- Tighten the bolt.

17. Install the auxiliary battery tray.

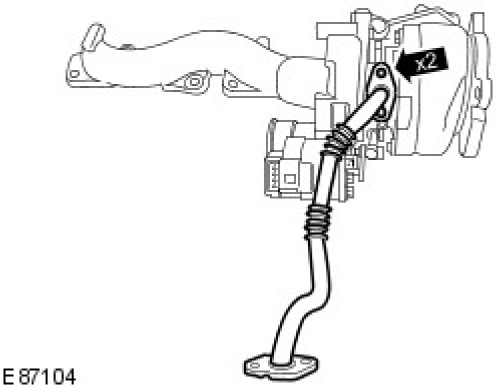
- Remove and discard the 8 nuts.
- Remove and discard the gasket.
- Remove and discard the 8 studs.



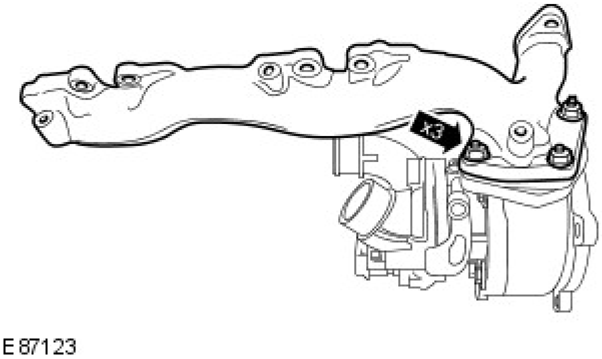
19. CAUTIONS:

⚠ Make sure that the area around the component is clean and free of foreign material.

⚠ Make sure that all openings are sealed. Use new blanking caps.

Remove the turbocharger oil return tube.

- Remove the 2 bolts.
- Remove and discard the gasket.



20. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Remove the exhaust manifold from the turbocharger.

- Remove the 3 nuts.
- Remove and discard the gasket.

Installation

1. NOTE: Remove and discard the blanking caps.

Install the exhaust manifold to the turbocharger.

- Clean the component mating faces.
- Install a new gasket.
- Loosely install the nuts.

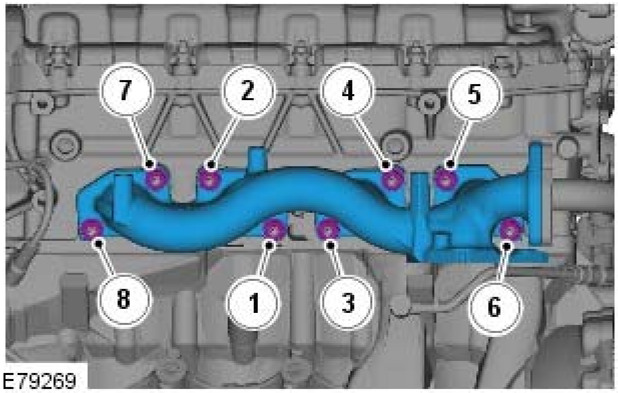
2. NOTE: Remove and discard the blanking caps.

Install the LH turbocharger oil return tube.

- Clean the component mating faces.
- Install a new gasket.
- Tighten the bolts to 10 Nm (7 lb.ft).

3. Install the 8 studs.

- Tighten the new studs to 13 Nm (10 lb.ft).



4. ⚠ CAUTION: To make sure that the exhaust manifold is correctly installed and the exhaust manifold nuts are correctly torqued, it is critical that the tightening torque is checked 2 further times after the initial torque has been applied.

• NOTE: Tighten the nuts in the sequence shown.

Install the LH exhaust manifold and turbocharger assembly.

- Clean the component mating face.
- Stage 1: Tighten the new nuts to 23 Nm (17 lb.ft).
- Stage 2: Wait for 2 minutes and tighten the nuts to 23 Nm (17 lb.ft).
- Stage 3: Wait for 2 minutes and tighten the nuts to 23 Nm (17 lb.ft).

5. Connect the LH turbocharger electrical connector.

6. ⚠ CAUTION: Install but do not fully tighten the turbocharger support bracket bolts. This will allow for movement of components during the final torque stages. Failure to follow this instruction may result in damage to the vehicle.

Install the LH turbocharger support bracket.

- Install the bolts.

7. Secure the LH turbocharger.

- Tighten the nuts to 24 Nm (18 lb.ft).

8. Secure the LH turbocharger support bracket.

- Stage 1: Tighten the LH turbocharger support bracket bolts at the turbocharger to 24 Nm (18 lb.ft).
- Stage 2: Tighten the LH turbocharger support bracket bolts at the cylinder block to 24 Nm (18 lb.ft).

9. Check tightness of the turbocharger nuts.

- Tighten the nuts to 24 Nm (18 lb.ft).

10. Secure the LH EGR valve inlet tube.

- Clean the component mating faces.
- Install a new gasket.
- Tighten the bolts to 10 Nm (7 lb.ft).

11. NOTE: Remove and discard the blanking caps.

Secure the LH turbocharger outlet pipe.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Tighten the clip.

12. NOTE: Remove and discard the blanking caps.

Connect the LH turbocharger oil supply pipe.

- Clean the component mating faces.
- Install new sealing washers.
- Tighten the banjo bolt to 24 Nm (18 lb.ft).

13. Install the LH exhaust manifold heat shield.

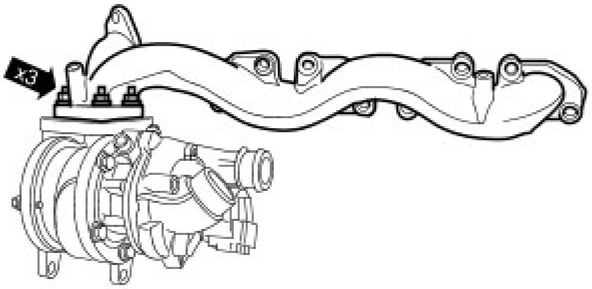
22. Remove the RH exhaust manifold and turbocharger assembly.

- Remove and discard the gasket.

23. Remove the exhaust manifold from the turbocharger.

- Remove and discard the 3 nuts.
- Remove and discard the gasket.



E87117

Installation

1. Install the exhaust manifold to the turbocharger.

- Clean the components mating faces.
- Install a new gasket.
- Loosely install the nuts.

2. Install the 8 studs.

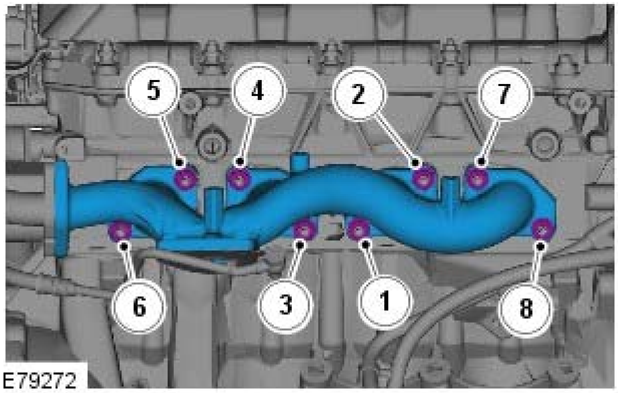
- Tighten the new studs to 13 Nm (10 lb.ft).

3. Install the RH exhaust manifold and turbocharger assembly.

- Clean the component mating faces.
- Install a new gasket.

4. Connect the RH turbocharger outlet pipe.

- Tighten the clip.



5. ⚠ CAUTION: To make sure that the exhaust manifold and turbocharger assembly is correctly installed and the exhaust manifold nuts are correctly torqued, it is critical that the tightening torque is checked 2 further times after the initial torque has been applied.

- NOTE: Tighten the nuts in the sequence shown.

Secure the RH exhaust manifold and turbocharger assembly.

- Clean the component mating face.
- Stage 1: Tighten the new nuts to 24 Nm (18 lb.ft).
- Stage 2: Wait for 2 minutes and tighten the nuts to 24 Nm (18 lb.ft).
- Stage 3: Wait for 2 minutes and tighten the nuts to 24 Nm (18 lb.ft).

6. ⚠ CAUTION: Install but do not fully tighten the turbocharger support bracket bolts. This will allow for movement of components during the final torque stages. Failure to follow this instruction may result in damage to the vehicle.

Install the RH turbocharger support bracket.

- Install the bolts.

7. Secure the RH turbocharger.

- Tighten the nuts to 24 Nm (18 lb.ft).

8. Secure the RH turbocharger support bracket.

- Stage 1: Tighten the RH turbocharger support bracket bolts at the cylinder block to 24 Nm (18 lb.ft).
- Stage 2: Tighten the RH turbocharger support bracket bolts at the turbocharger to 24 Nm (18 lb.ft).

9. Check tightness of the turbocharger nuts.

- Tighten the nuts to 24 Nm (18 lb.ft).

- Tighten the bolts to 10 Nm (7 lb.ft).
- Tighten the nut to 10 Nm (7 lb.ft).

15. Install the RH turbocharger heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

16. Install the RH catalytic converter.

- Clean the components mating faces.
- Install a new gasket.
- Tighten the bolts to 25 Nm (18 lb.ft).

17. Secure the RH catalytic converter.

- Clean the components mating faces.
- Tighten the nuts to 55 Nm (40 lb.ft).

18. NOTE: Remove and discard the blanking caps.

Install the oil level indicator and upper oil level indicator tube.

- Clean the components mating faces.
- Install new O-ring seals.
- Tighten the bolt to 9 Nm (7 lb.ft).

19. Secure the breather line.

- Tighten the M6 bolts to 10 Nm (7 lb.ft).
- Tighten the M8 bolts to 23 Nm (17 lb.ft).

43. Remove the RH fuel line shield.

- Remove the 7 nuts.

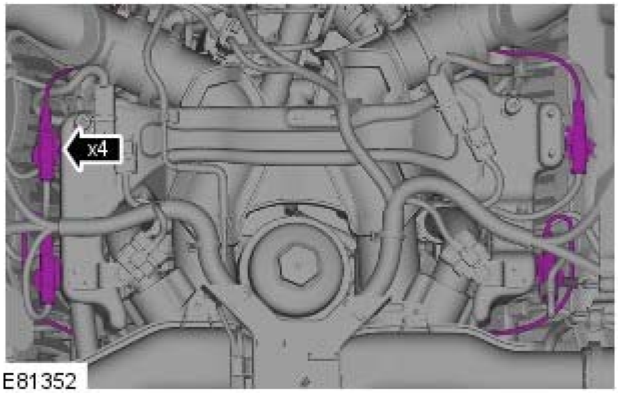
44. NOTE: Left-hand shown, right-hand similar.

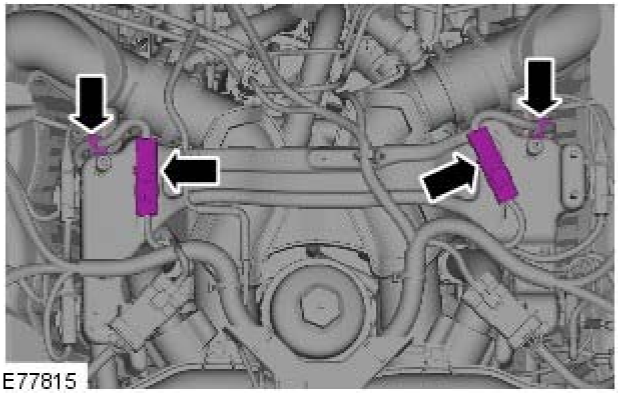
Disconnect the 8 fuel injector electrical connectors.

- Release the fuel charging wiring harness.



45. Disconnect the knock sensor (KS) electrical connectors.

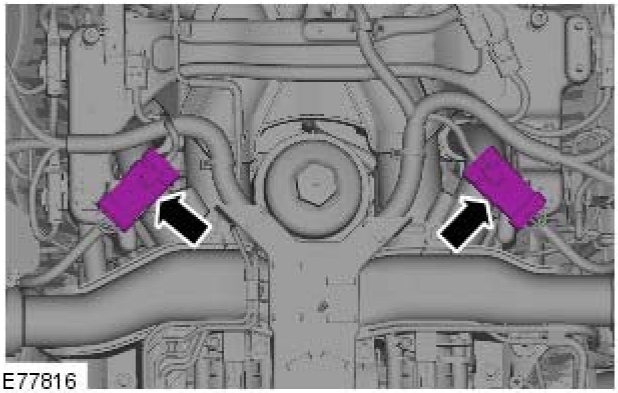
- Release the wiring harness.



E77815

46. Disconnect the glow plug electrical connectors.

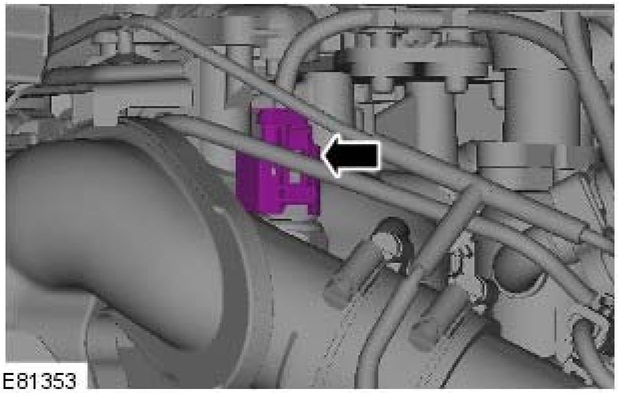
- Release the wiring harness.



E77816

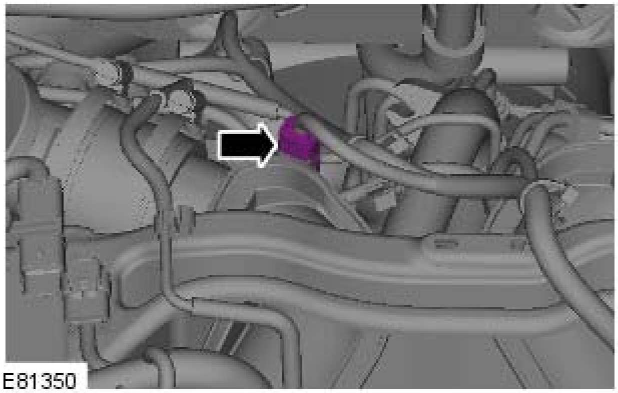
47. Disconnect both exhaust gas recirculation (EGR) valve electrical connectors.

- Release the wiring harness.



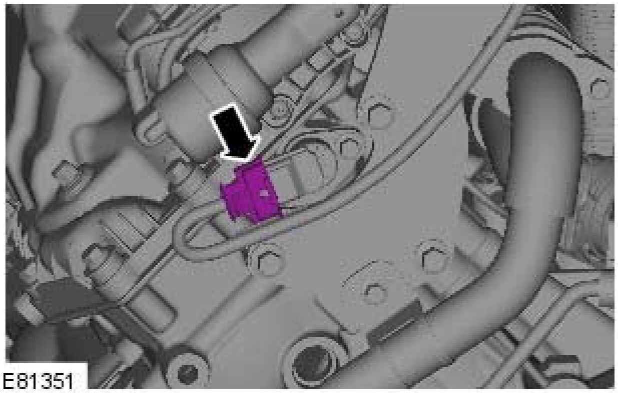
E81353

48. Disconnect the fuel rail pressure (FRP) sensor electrical connector.



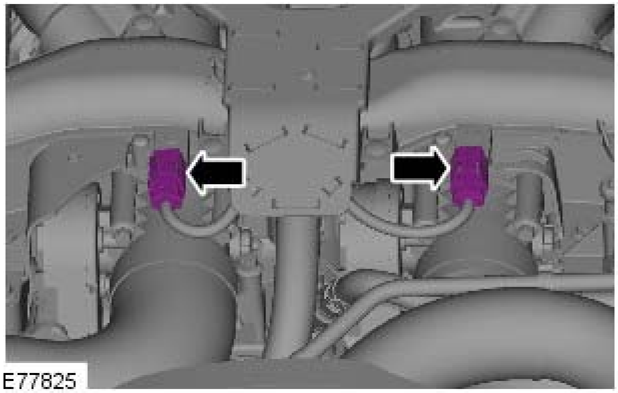
E81350

49. Disconnect the fuel temperature sensor electrical connector.



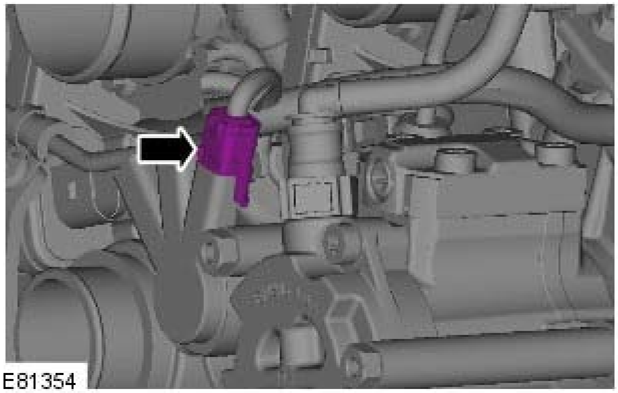
E81351

50. Disconnect the camshaft position (CMP) sensor electrical connector.



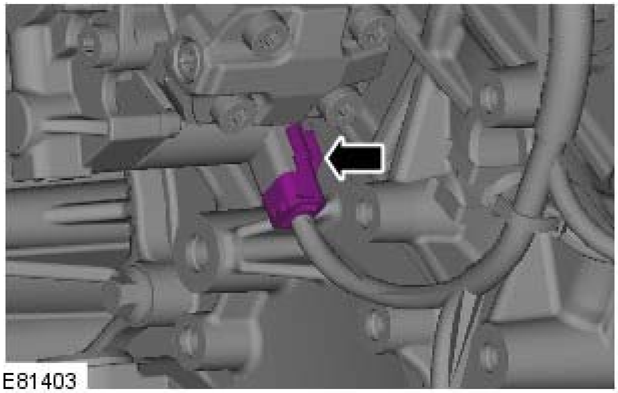
E77825

51. Disconnect both manifold absolute pressure and temperature (MAPT) sensor electrical connectors.



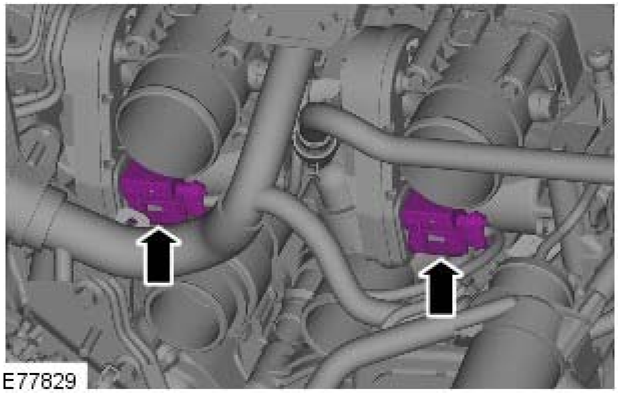
E81354

52. Disconnect the fuel pressure control valve electrical connector.



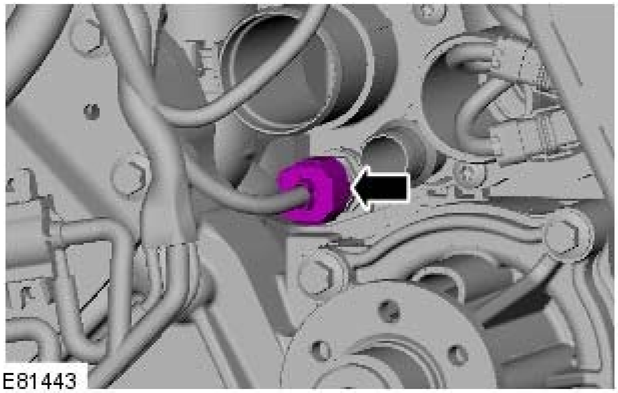
E81403

53. Disconnect the fuel metering valve electrical connector.

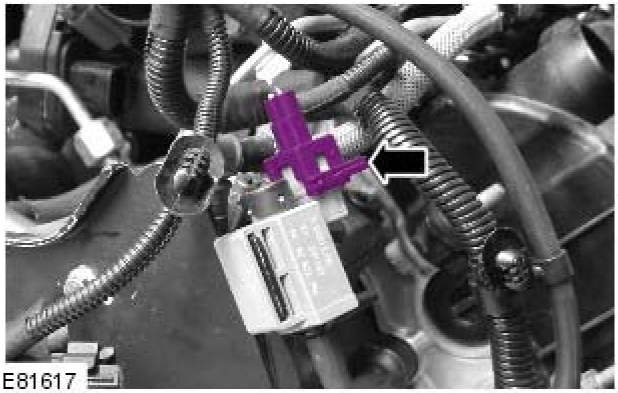


54. Disconnect both throttle body electrical connectors.

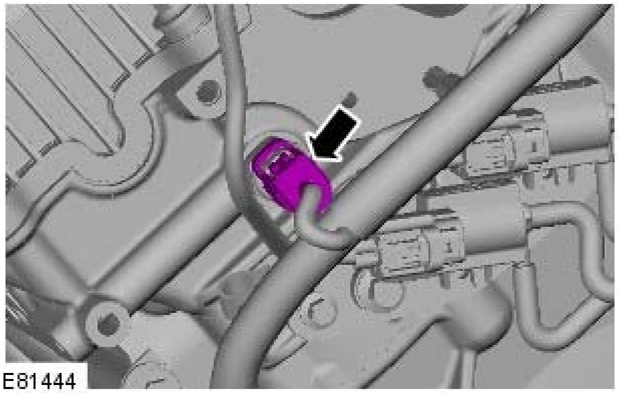
- Release the locking tangs.



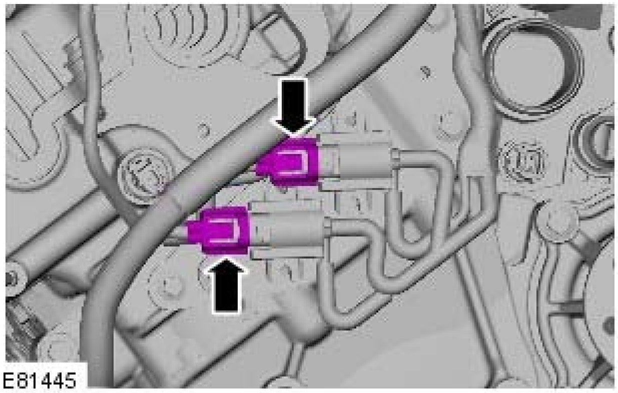
55. Disconnect the engine coolant temperature (ECT) sensor electrical connector.



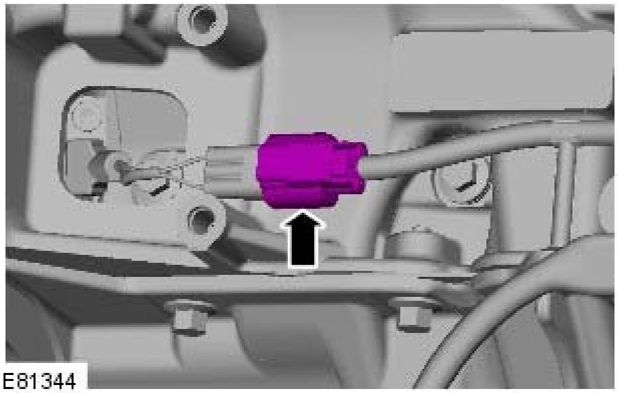
56. Disconnect the air suspension solenoid electrical connector.



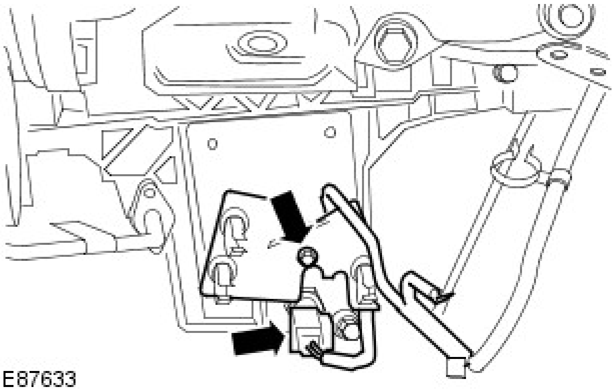
57. Disconnect the engine oil pressure (EOP) sensor electrical connector.



58. Disconnect the vacuum solenoid electrical connectors.



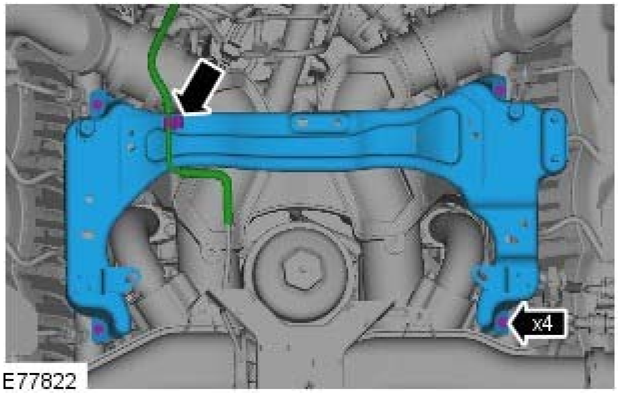
59. Disconnect the crankshaft position (CKP) sensor electrical connector.



60. Disconnect the engine oil temperature sensor electrical connector.

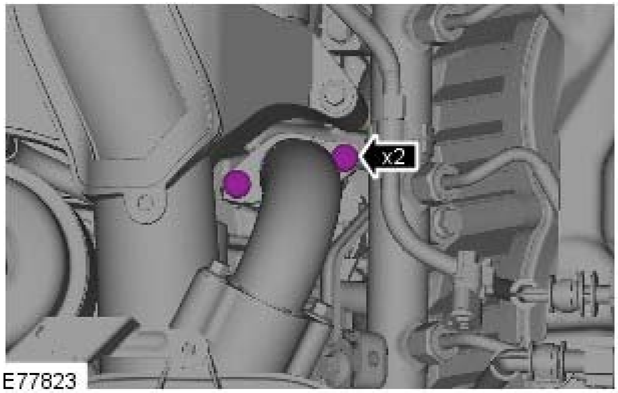
61. Remove the engine wiring harness.

- Release the clips.



62. Remove the engine cover mounting bracket.

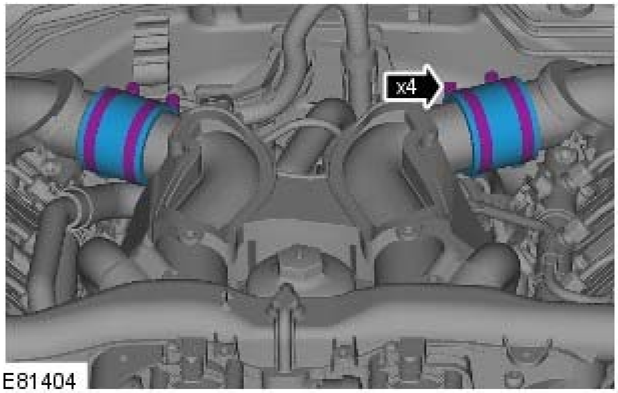
- Release the vacuum line.
- Remove the 4 bolts.



63. NOTE: Left-hand shown, right-hand similar.

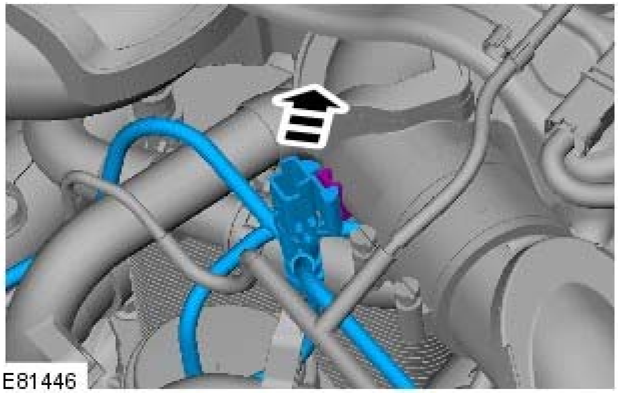
Release both EGR valve outlet tubes.

- Remove the 4 bolts.

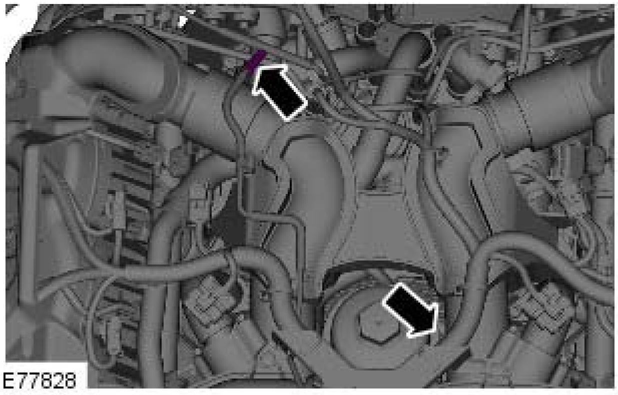


64. Reposition the intake manifold plenum chamber rear hoses.

- Release the clips.

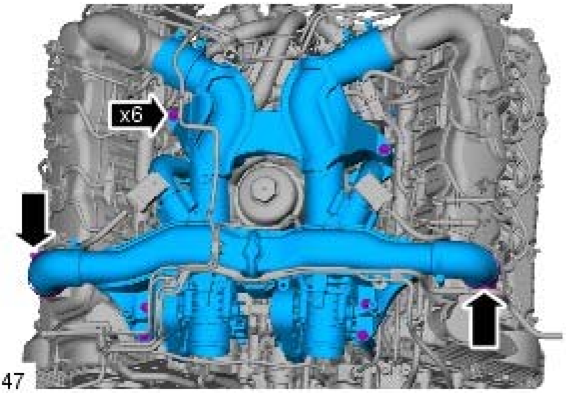


65. Release the fuel temperature sensor.



E77828

66. Disconnect the vacuum lines.

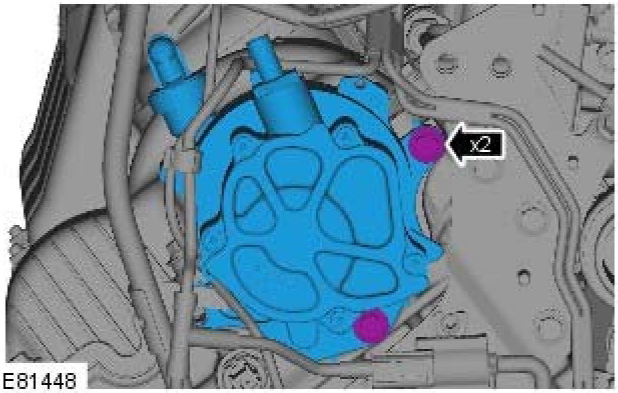


E81447

67. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Remove the intake manifold plenum chamber.

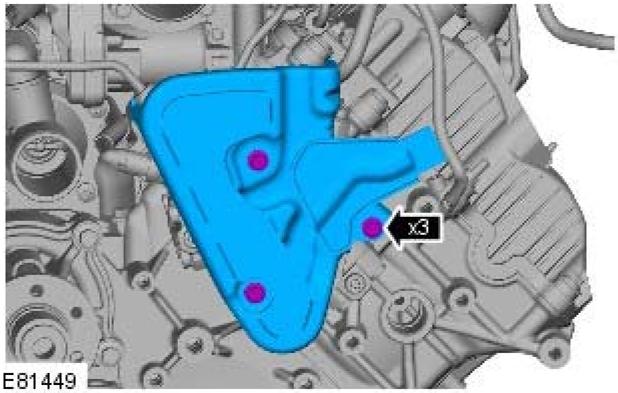
- Release the clips.
- Fully loosen the 6 bolts.
- Remove and discard the EGR valve outlet tube gaskets.



E81448

68. Remove the brake vacuum pump.

- Remove the 2 bolts.
- Remove and discard the gasket.

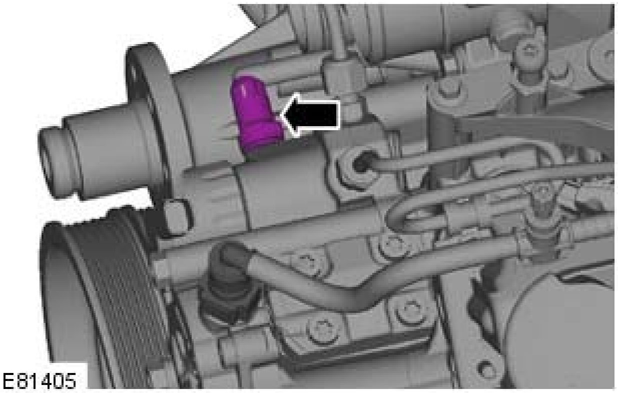


E81449

69. Remove the fuel pump shield.

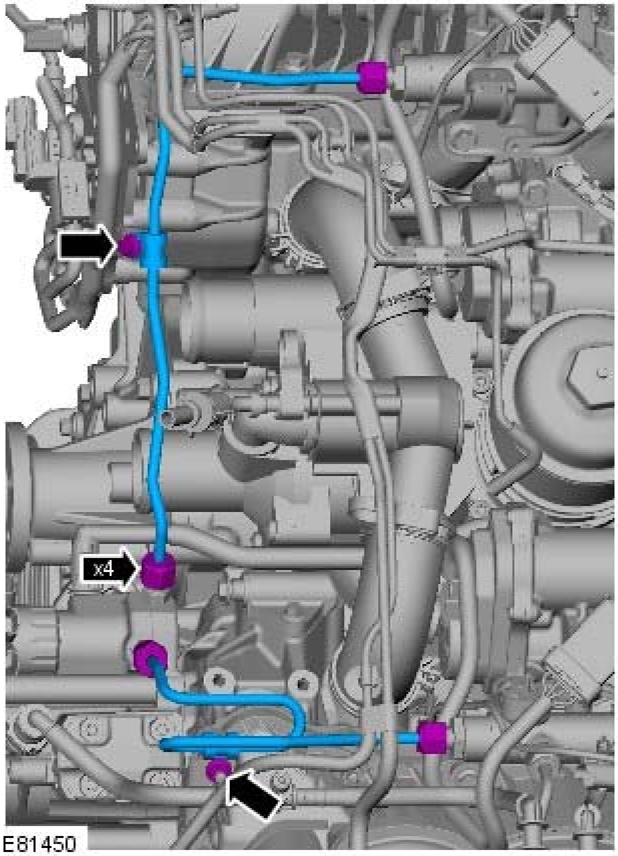
- Remove the 3 bolts.

70. Using the pneumatic vacuum gun, vacuum foreign material from the high-pressure fuel supply lines, the fuel rails and the fuel injection pump.
For additional information, refer to: Fuel Injection Component Cleaning (303-04, General Procedures).



71. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

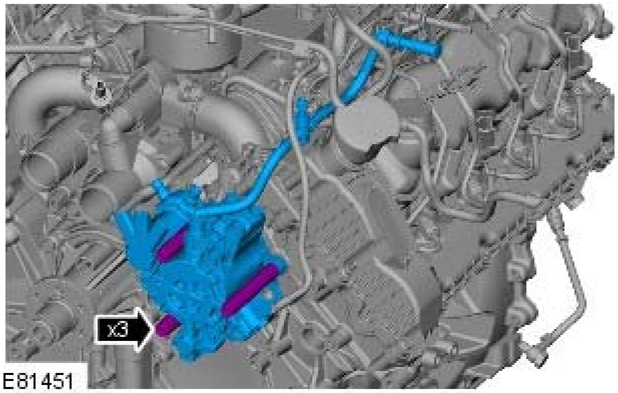
Disconnect the low-pressure fuel return line.



72. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

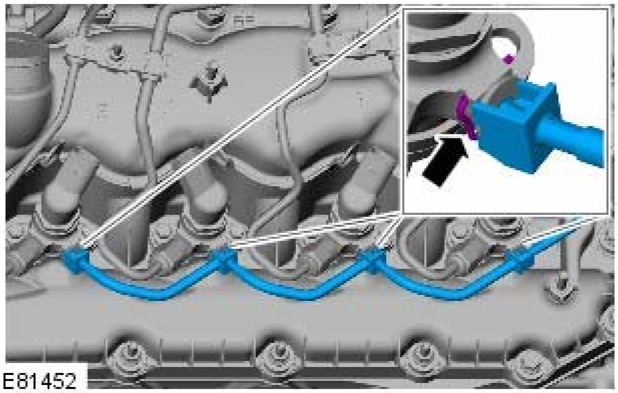
Remove and discard the high-pressure fuel supply lines.

- Remove the 2 bolts.



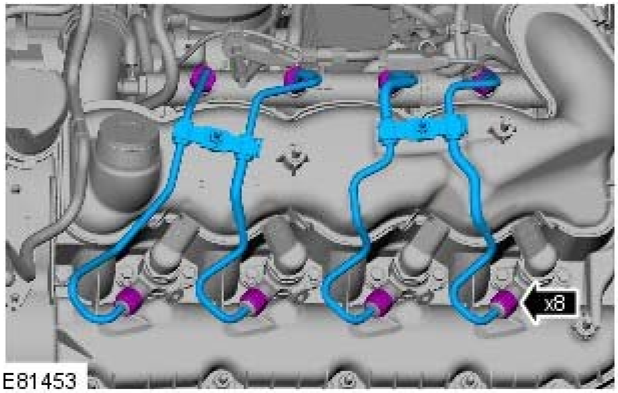
73. Remove the fuel pump.

- Release the low-pressure fuel supply line.
- Remove the 3 bolts.
- Remove and discard the gasket.



74. Disconnect the fuel return line from the fuel injectors.

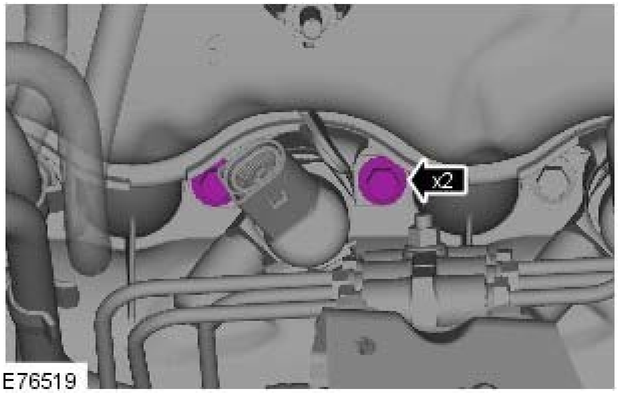
- Remove and discard the 8 fuel return line clips.



75. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

• NOTE: Left-hand shown, right-hand similar.

Remove and discard the high-pressure fuel supply lines.



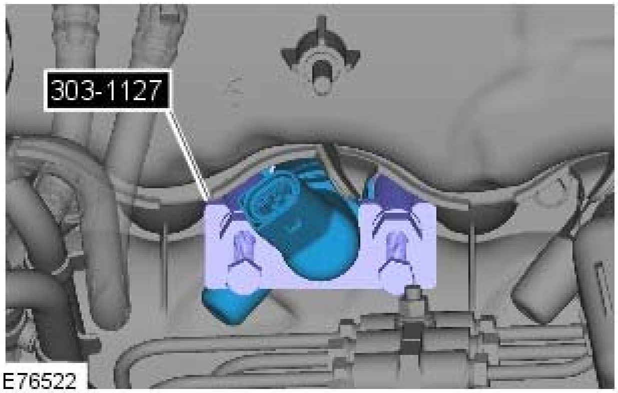
76. Remove the 2 fuel injector bolts.

77. Install the special tool studs.

78. ⚠CAUTION: Make sure the fuel injector remover legs are correctly engaged to the fuel injector. Failure to follow this instruction may result in damage to the component.

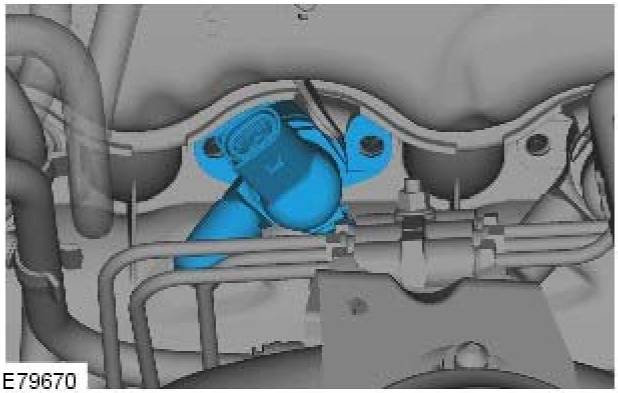
Install the special tool remover legs to the studs.

79. Install the special tool locking plate to the remover legs.



80. Remove the fuel injector.

- Rotate the special tool bolts evenly, in a clockwise direction.
- Remove the special tool.

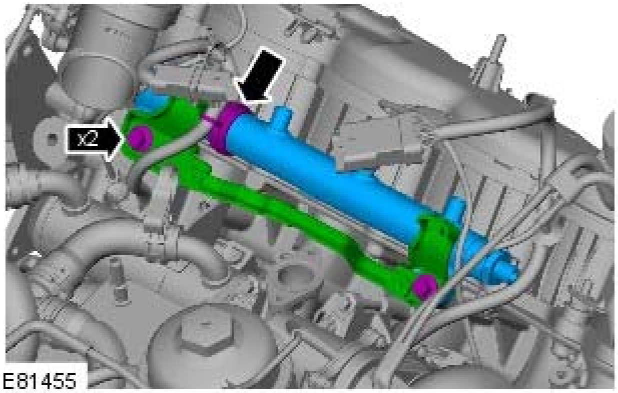


81. Remove the remaining fuel injectors.

82. NOTE: Left-hand shown, right-hand similar.

Remove the fuel rails.

- Release the glow plug wiring harness.
- Remove the 4 bolts.
- Remove the brackets.

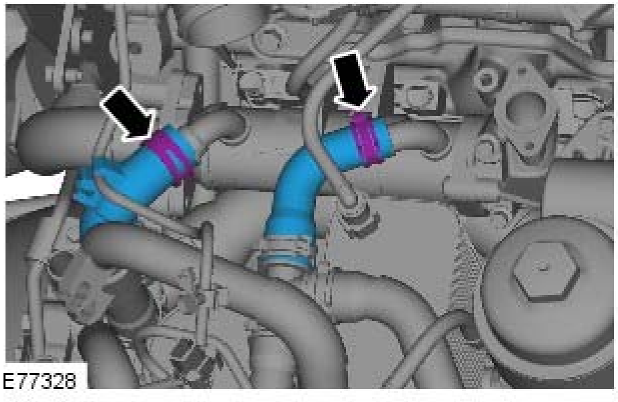


83. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

• NOTE: Left-hand shown, right-hand similar.

Disconnect the EGR cooler coolant hoses.

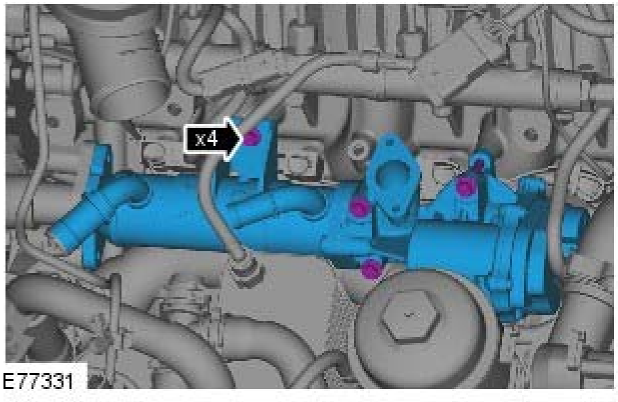
- Release the 4 clips.



84. NOTE: Left-hand shown, right-hand similar.

Remove the EGR valve and cooler assemblies.

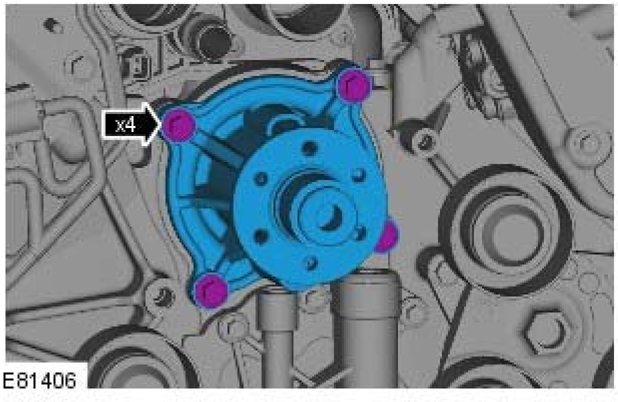
- Remove the 8 bolts.



85. NOTE: Some fluid spillage is inevitable during this operation.

Remove the coolant pump.

- Position a container to collect the fluid spillage.
- Remove the 4 bolts.
- Remove and discard the O-ring seal.



86. Install the special tool.

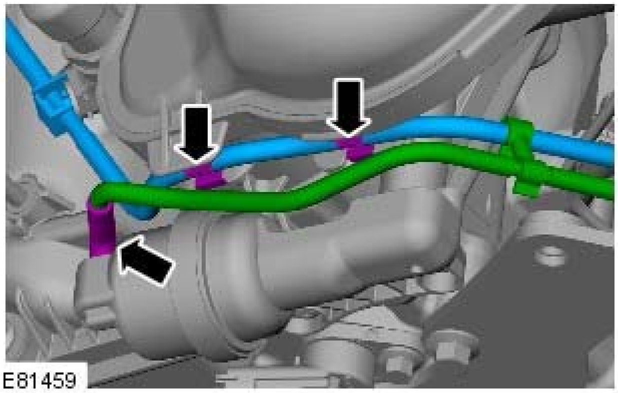
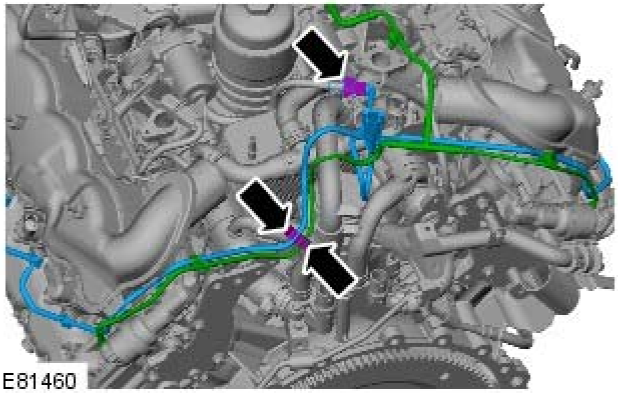
- Remove and discard the 2 O-ring seals.



91. NOTE: Left-hand shown, right-hand similar.

Release the vacuum and fuel return lines.

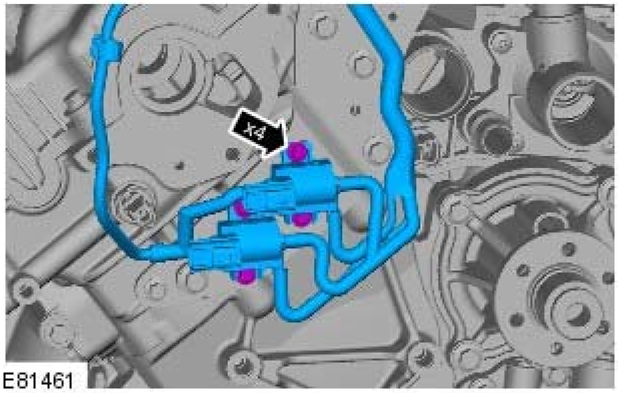
- Release the fuel return line from the valve covers.
- Disconnect the vacuum hose.



92. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

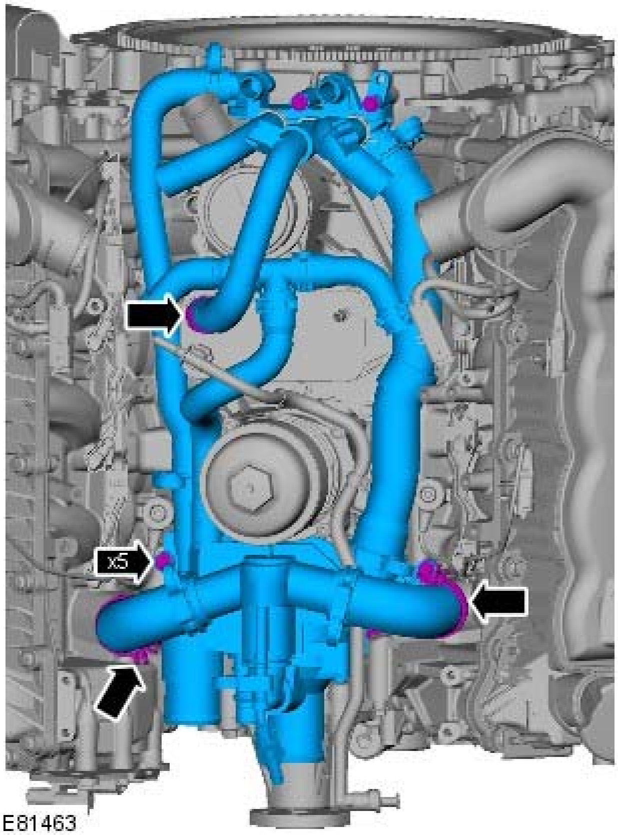
Remove the vacuum and fuel return lines.

- Disconnect the fuel return line from the fuel cooler.



93. Remove the vacuum solenoids and lines.

- Remove the 4 bolts.



E81463

94. Remove the cylinder block coolant elbow and hose assembly.

- Disconnect the coolant hoses.

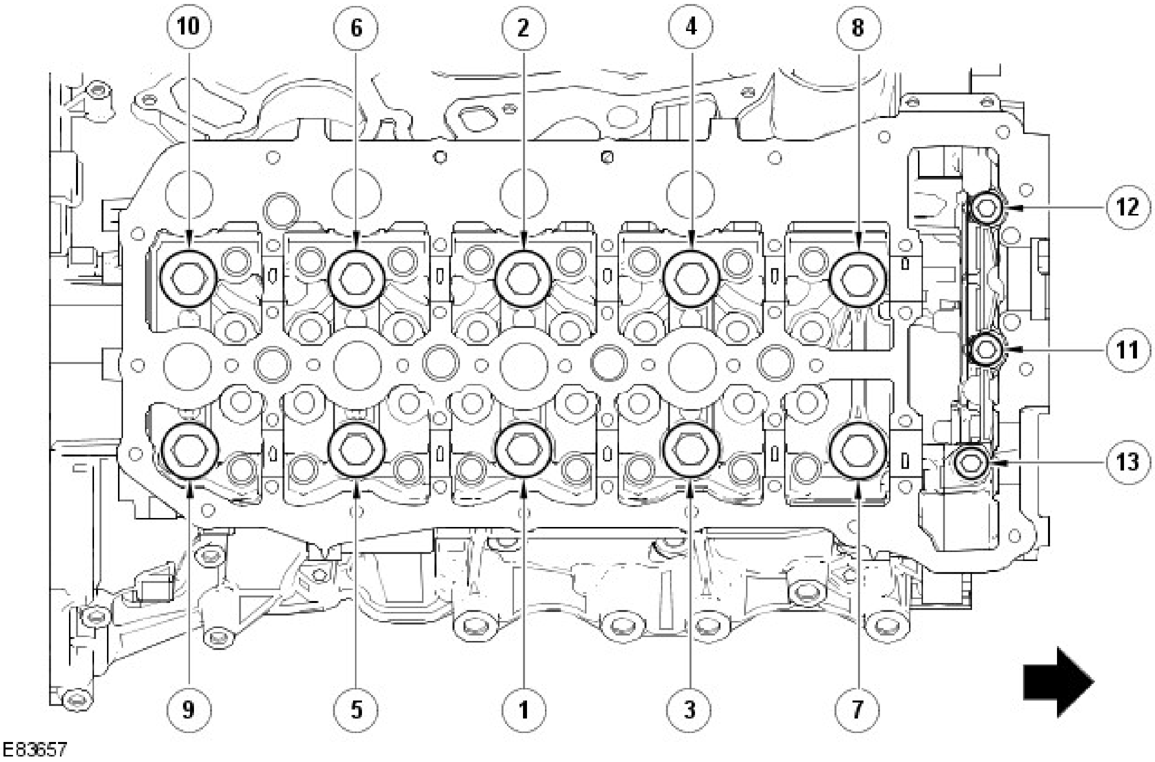
1. NOTE: The cylinder head gasket must be installed over the cylinder head to cylinder block dowels.

Install a new RH cylinder head gasket.

- Clean the component mating face.

2. Check cylinder head face for distortion, across the center and from corner to corner.



3. CAUTIONS:

⚠ Tighten the bolts in the sequence shown.

⚠ Use care when installing the cylinder head. Damage to the cylinder block, cylinder head or cylinder head gasket may result.

⚠ Make sure that new cylinder head bolts are installed.

• NOTE: Make sure the cylinder head is installed in its original position.

• NOTE: No additional lubrication to the cylinder head bolts is required.

Install the RH cylinder head assembly.

- Clean the component mating face.
- Stage 1: Tighten the M13 bolts to 20 Nm (15 lb.ft).
- Stage 2: Tighten the M13 bolts to 40 Nm (30 lb.ft).
- Stage 3: Tighten the M13 bolts to 80 Nm (59 lb.ft).
- Stage 4: Tighten the M13 bolts a

further 180 degrees.

- Stage 5: Tighten the M8 bolts to 20 Nm (15 lb.ft).

4. NOTE: Make sure that all the components are clean.

• NOTE: Lubricate the hydraulic adjuster and rocker assemblies with clean engine oil.

Install the hydraulic adjuster and rocker assemblies.

5. NOTE: Make sure that all the components are clean.

Install the RH camshafts.

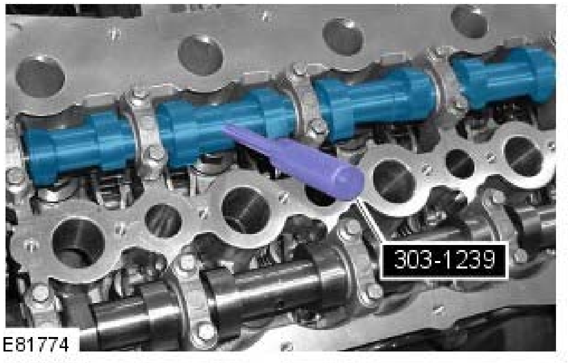
- Lubricate the camshaft journals and camshaft lobes.

6. ⚠CAUTION: Tighten the bolts evenly in the stages shown.

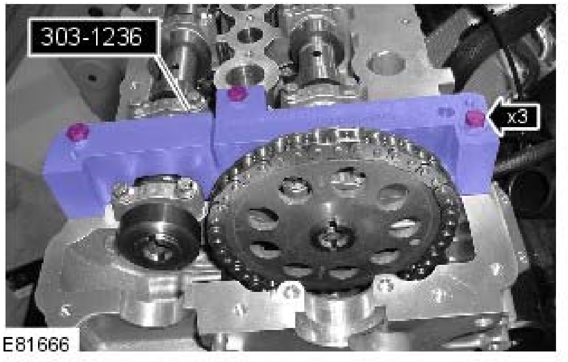
• NOTE: Make sure that all the components are clean.

Install the camshaft bearing caps.

- Lubricate the component mating faces with clean engine oil.
- Stage 1: Tighten the bolts to 1 Nm (0.7 lb.ft).
- Stage 2: Tighten the bolts to 5 Nm (3.7 lb.ft).
- Stage 3: Tighten the bolts to 10 Nm (7 lb.ft).



7. Using the special tool, rotate the camshafts and hold in the 12 o'clock position.



8. Install the special tool.

- Tighten the bolts to 10 Nm (7 lb.ft).

9. Install the RH timing chain tensioner guides.

- Tighten the bolts.

10. NOTE: Lubricate the O-ring seal with clean engine oil.

Install the RH timing chain tensioner guide pin.

- Install a new O-ring seal.
- Tighten to 28 Nm (21 lb.ft).

11. Install the engine lifting eye bracket.

- Tighten the bolts.

12. Install the RH timing chain.

13. ⚠ CAUTION: Do not tighten the camshaft sprocket bolts at this stage.

Install the RH timing chain sprocket and gears.

- Install the brake vacuum pump drive gear.
- Loosely install the new bolts.

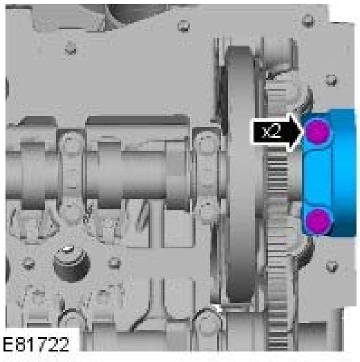
14. NOTE: Lubricate the O-ring seals with clean engine oil.

Install a new RH hydraulic timing chain tensioner.

- Tighten the bolts to 10 Nm (7 lb.ft).

15. Install the vacuum pump cap.

- Tighten the bolts to 10 Nm (7 lb.ft).



16. NOTE: The cylinder head gasket must be installed over the cylinder head to cylinder block dowels.

Install a new LH cylinder head gasket.

17. Check cylinder head face for distortion, across the center and from corner to corner.

- Stage 3: Tighten the M13 bolts to 80 Nm (59 lb.ft).
- Stage 4: Tighten the M13 bolts a further 180 degrees.
- Stage 5: Tighten the M8 bolts to 20

Nm (15 lb.ft).

19. NOTE: Make sure that all the components are clean.

• NOTE: Lubricate the hydraulic adjuster and rocker assemblies with clean engine oil.

Install the hydraulic adjuster and rocker assemblies.

20. NOTE: Make sure that all the components are clean.

Install the LH camshafts.

- Lubricate the camshaft journals and camshaft lobes.

21. ⚠ CAUTION: Tighten the bolts evenly in the stages shown.

• NOTE: Make sure that all the components are clean.

Install the camshaft bearing caps.

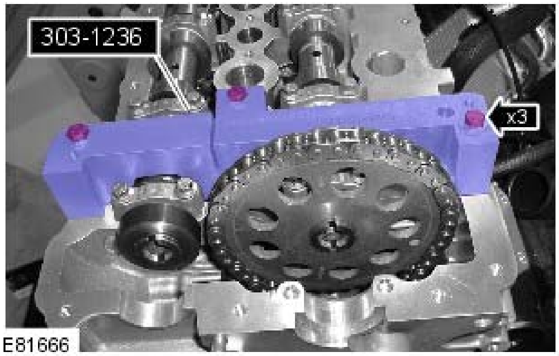
22. Using the special tool, rotate the camshafts and hold in the 12 o'clock position.



23. Install the special tool.

- Tighten the bolts to 10 Nm (7 lb.ft).

24. Install the LH timing chain tensioner guides.

- Tighten the bolts.

25. NOTE: Lubricate the O-ring seal with clean engine oil.

Install the LH timing chain tensioner guide pin.

- Install a new O-ring seal.
- Tighten to 28 Nm (21 lb.ft).

26. Install the LH timing chain.

27. ⚠ CAUTION: Do not tighten the camshaft sprocket bolts at this stage.

Install the LH timing chain sprocket and gears.

- Loosely install the new bolts.

28. NOTE: Lubricate the O-ring seals with clean engine oil.

Install a new LH hydraulic timing chain tensioner.

- Tighten the bolts to 10 Nm (7 lb.ft).

29. Release the hydraulic timing chain tensioners.

- Tighten the bolts to 10 Nm (7 lb.ft).

30. ⚠ CAUTION: Make sure that the crankshaft is still touching the timing pin.

Tighten the LH camshaft sprocket and gears.

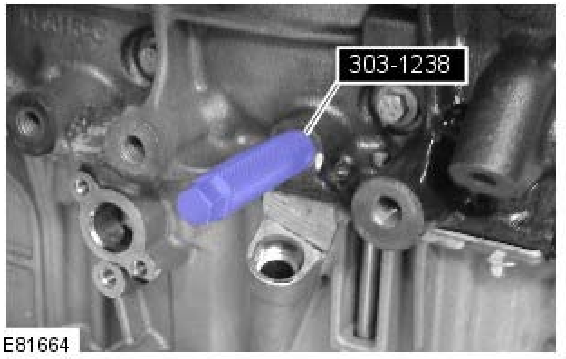
- Stage 1: Tighten the exhaust camshaft gear bolt to 80 Nm (59 lb.ft).
- Stage 2: Tighten the exhaust camshaft gear bolt a further 80 degrees.
- Stage 3: Tighten the intake camshaft sprocket and gear bolt to 80 Nm (59 lb.ft).
- Stage 4: Tighten the intake camshaft sprocket and gear bolt a further 80 degrees.

31. Tighten the RH camshaft sprocket and gears.

- Stage 1: Tighten the exhaust camshaft gear bolt to 80 Nm (59 lb.ft).
- Stage 2: Tighten the exhaust camshaft gear bolt a further 80 degrees.
- Stage 3: Tighten the intake camshaft sprocket and gear bolt to 80 Nm (59 lb.ft).
- Stage 4: Tighten the intake camshaft sprocket and gear bolt a further 80 degrees.

32. Remove the special tools.

33. Remove the special tool.

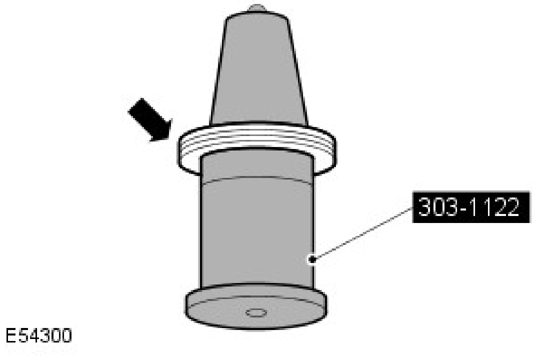


34. Install the crankshaft timing pin plug.

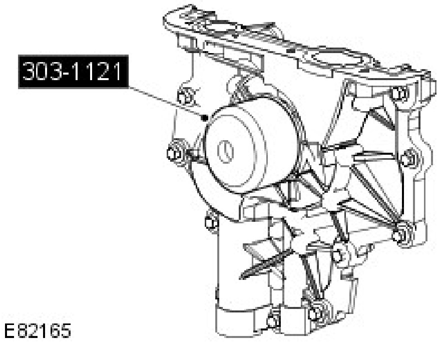
35. ⚠ CAUTION: Prime the oil pump with 20cc of engine oil.

Install the oil pump.

- Clean the component mating faces.
- Install a new gasket.
- Stage 1: Tighten the bolts to 4 Nm (3 lb.ft).
- Stage 2: Tighten the bolts to 10 Nm (7 lb.ft).



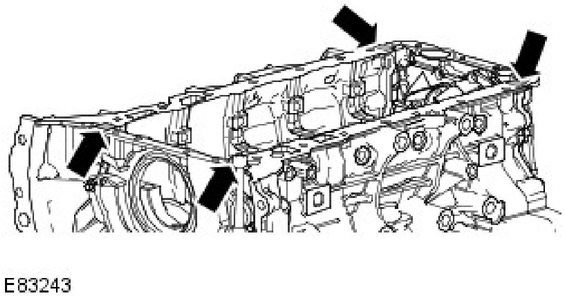
36. Install a new crankshaft front seal to the special tool.



37. Remove the sleeve from the special tool.

38. Using the special tool, install a new crankshaft front seal.

- Use the discarded crankshaft bolt with the special tool.



39. Install the oil pan.

- Clean the component mating faces.
- Apply sealant to the 4 places shown.
- Install a new gasket.

40. ⚠ CAUTION: Tighten the bolts in the sequence shown.

Secure the oil pan.

- Tighten bolts A to 10 Nm (7 lb.ft).
- Tighten bolts B to 23 Nm (17 lb.ft).

- Install a new gasket.

- Tighten the bolts to 10 Nm (7 lb.ft).

45. CAUTION: Install the crankshaft position (CKP) sensor correctly into the housing. Failure to follow this instruction may result in damage to the CKP sensor.

Install the CKP sensor.

- Tighten the bolt to 5 Nm (4 lb.ft).

46. Install the camshaft position (CMP) sensor.

- Install a new O-ring seal.
- Tighten the bolt.

47. Install the engine oil pressure (EOP) sensor.

- Tighten the sensor to 15 Nm (11 lb.ft).

48. Install the cylinder block coolant elbow and hose assembly.

- Install a new O-ring seal.
- Tighten the bolts to 10 Nm (7 lb.ft).
- Connect the coolant hoses.
- Secure with the clips.

49. Install the vacuum solenoids and lines.

- Tighten the bolts to 10 Nm (7 lb.ft).

50. NOTE: Remove and discard the blanking caps.

Install the vacuum and fuel return lines.

- Connect the fuel return line to the fuel cooler.
- Secure the fuel return line to the valve covers.
- Connect the vacuum lines.

51. NOTE: Remove and discard the blanking caps.

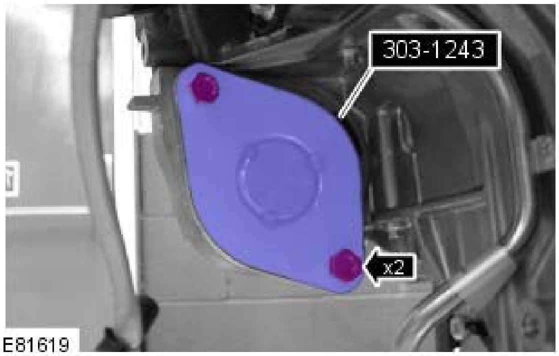
Install the fuel cooler fuel return line.

52. NOTE: Remove and discard the blanking caps.

Install the turbocharger oil supply line.

- Install new O-ring seals.
- Tighten the bolts to 10 Nm (7 lb.ft).

53. Install the special tool.



54. CAUTION: Make sure that new bolts are installed.

Install the flexplate.

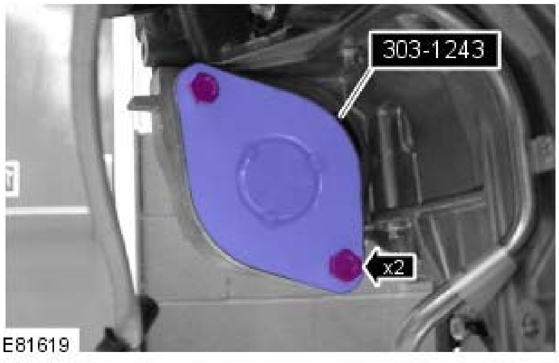
- Tighten the bolts to 95 Nm (70 lb.ft).

55. CAUTION: Make sure that the washer is installed between the nose of the crankshaft and the crankshaft pulley.

Install the crankshaft pulley.

- A new crankshaft pulley bolt must be installed.
- Stage 1: Tighten the bolt to 140 Nm (103 lb.ft).
- Stage 2: Tighten a further 90 degrees.

56. Remove the special tool.



57. Install the coolant pump.

- Install a new O-ring seal.
- Tighten the bolts to 23 Nm (17 lb.ft).

58. Install the exhaust gas recirculation (EGR) valve and cooler assemblies.

- Tighten the bolts to 10 Nm (7 lb.ft).

59. NOTE: Remove and discard the blanking caps.

Connect the EGR cooler coolant hoses.

- Secure with the clips.

60. CAUTION: Only tighten the bolts finger-tight at this stage.

Install both fuel rails.

- Install the brackets.
- Loosely install the bolts.

61. CAUTIONS:

Do not disassemble the fuel injectors or clean the nozzles, even with an ultrasonic cleaner. Always install new fuel injectors when required.

Do not use tools to install the new fuel return line clip. Failure to follow this instruction will result in damage to the clip.

Install a new fuel injector clamp.

- Install a new sealing washer.
- Install a new fuel return line clip.

62. CAUTION: Only tighten the bolts finger-tight at this stage.

• NOTE: Remove and discard the blanking caps.

Install the fuel injector.

- Loosely install the bolts.

63. Install the remaining fuel injectors.

- Loosely install the bolts.

64. Install the fuel pump.

- Install a new gasket.
- Tighten the bolts to 23 Nm (17 lb.ft).
- Secure the fuel line.

65. CAUTIONS:

⚠ Maintain pressure on the high-pressure fuel supply line to keep the olives in contact with the fuel injectors and the fuel rail cones while installing unions.

⚠ Do not allow the unions to hit the olive ends of the high-pressure fuel supply line as this may damage the ends of the high-pressure fuel supply line and allow foreign matter to enter the fuel injection system.

⚠ Only tighten the unions finger-tight at this stage.

• NOTE: Remove and discard the blanking caps.

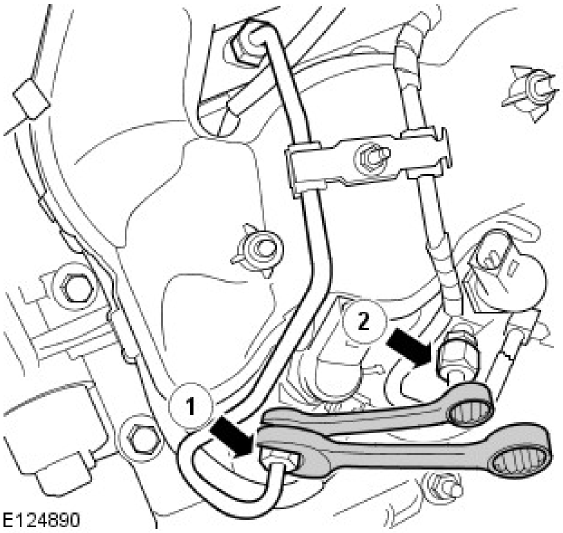
Loosely install the new high-pressure fuel supply lines.

66. Secure the fuel injectors.

- Tighten the bolts to 10 Nm (7 lb.ft).

67. Secure the fuel rails.

- Tighten the bolts to 23 Nm (17 lb.ft).



68. CAUTIONS:

⚠ Do not allow the unions to hit the olive ends of the high-pressure fuel supply line as this may damage the ends of the line and allow foreign matter to enter the fuel injection system.

⚠ Maintain pressure on the high-pressure fuel supply lines to keep the olives in contact with the fuel injectors and the fuel rail cones while installing the unions.

⚠ Do not use any aggressive cleaning fluid or a wire brush to clean the fluid injector nozzle.

• NOTE: Remove and discard the blanking caps.

Install new high-pressure fuel supply lines.

1. Install the new high-pressure fuel supply line, tighten the fuel supply line unions finger tight.

- Tighten the high-pressure fuel supply line in the sequence shown:
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 15 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 15 Nm.
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 30 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 30 Nm.

69. Secure the fuel line.

70. Secure the glow plug wiring harness.

71. ⚠ CAUTION: Make sure the fuel return line clip is correctly installed to the fuel injector before installing the return line.

Connect the fuel return line to the fuel injectors.

- Visually inspect the fuel return line O-ring seals for damage.
- Apply a light coating of petroleum jelly to the fuel return line O-ring seals.

72. NOTE: Remove and discard the blanking caps.

Connect the low-pressure fuel return line.

73. Install the fuel pump shield.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Secure the vacuum solenoid.

74. ⚠ CAUTION: Make sure that the mating faces are clean and free of foreign material.

Install the brake vacuum pump.

- Install a new gasket.
- Tighten the bolts to 23 Nm (17 lb.ft).

75. NOTE: Remove and discard the blanking caps.

Install the intake manifold plenum chamber.

- Install new gaskets to the EGR valve outlet tubes.
- Tighten the bolts to 10 Nm (7 lb.ft).
- Tighten the clips to 3 Nm (2 lb.ft).

76. Connect the vacuum lines.

77. Secure the fuel temperature sensor.

78. Secure the intake manifold plenum chamber rear hoses.

- Tighten the clips to 3 Nm (2 lb.ft).

79. Secure both EGR valve outlet tubes.

- Tighten the bolts to 10 Nm (7 lb.ft).

80. Install the engine cover mounting bracket.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Secure the vacuum line.

81. Install the engine wiring harness.

- Secure with the clips.

82. Connect the engine oil temperature sensor electrical connector.

83. Connect the CKP sensor electrical connector.

84. Connect the vacuum solenoid electrical connectors.

85. Connect the EOP sensor electrical connector.

86. Connect the air suspension solenoid electrical connector.

87. Connect both throttle body electrical connectors.

- Secure the locking tangs.

88. Connect the ECT sensor electrical connector.

89. Connect the fuel pressure control valve electrical connector.

90. Connect the fuel metering valve electrical connector.

91. Connect both manifold absolute pressure and temperature (MAPT) sensor electrical connectors.

92. Connect the CMP sensor electrical connector.

93. Connect the fuel temperature sensor electrical connector.

94. Connect the fuel rail pressure (FRP) sensor electrical connector.

95. Connect both EGR valve electrical connectors.

- Secure the wiring harness.

96. Connect the glow plug electrical connectors.

- Secure the wiring harness.

97. Connect the KS electrical connectors.

- Secure the wiring harness.

98. Connect the fuel injector electrical connectors.

- Secure the wiring harness.

99. Install the RH fuel line shield.

- Tighten the nuts to 5 Nm (7 lb.ft).

100. Install the LH fuel line shield.

- Tighten the nuts to 5 Nm (7 lb.ft).

101. NOTE: Remove and discard the blanking caps.

Install the oil level indicator and tube.

- Install a new O-ring seal.
- Tighten the upper bolt to 10 Nm (7 lb.ft).
- Tighten the lower bolt to 7 Nm (5 lb.ft).

102. NOTE: Only carry out the following step if a new exhaust manifold is to be installed.

Install a new assembly spacer to the exhaust manifold stud number 8.

103. NOTE: Only carry out the following step if a new turbocharger and a new exhaust manifold is to be installed.

Install the 2 new assembly spacers to the turbocharger studs.

104. Install the RH exhaust manifold and turbocharger assembly.

- Clean the component mating faces.
- Install a new gasket.
- Loosely install the exhaust manifold nuts.

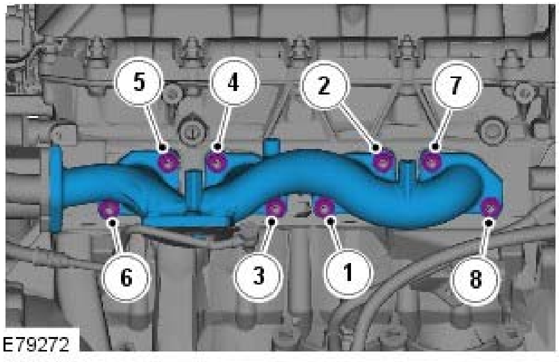
105. Install the support bracket.

- Tighten the bolts to 24 Nm (18 lb.ft).

106. ⚠ CAUTION: Install but do not fully tighten the turbocharger support bracket bolts. This will allow for movement of components during the final torque stages. Failure to follow this instruction may result in damage to the vehicle.

Install the RH turbocharger support bracket.

- Install the bolts.



107. ⚠ CAUTION: To make sure that the exhaust manifold and turbocharger assembly is correctly installed and the exhaust manifold nuts are correctly torqued, it is critical that the tightening torque is checked 2 further times after the initial torque has been applied.

• NOTE: Tighten the nuts in the sequence shown.

Secure the RH exhaust manifold and turbocharger assembly.

- Stage 1: Tighten the new nuts to 23 Nm (17 lb.ft).
- Stage 2: Wait for 2 minutes and tighten the nuts to 23 Nm (17 lb.ft).
- Stage 3: Wait for 2 minutes and tighten the nuts to 23 Nm (17 lb.ft).

108. Secure the RH turbocharger support bracket.

- Stage 1: Tighten the RH turbocharger support bracket bolts at the turbocharger to 24 Nm (18 lb.ft).
- Stage 2: Tighten the RH turbocharger support bracket bolts at the cylinder block to 24 Nm (18 lb.ft).

109. NOTE: Remove and discard the blanking caps.

Connect the RH turbocharger oil supply pipe.

- Install new sealing washers.
- Tighten the banjo bolt to 24 Nm (18 lb.ft).

110. Secure the RH turbocharger oil return tube.

- Install a new gasket.
- Tighten the bolts to 10 Nm (7 lb.ft).

111. Connect the RH turbocharger electrical connector.

112. Install the RH engine mount bracket.

- Tighten the bolts to 115 Nm (85 lb.ft).

113. Install the oil pick-up pipe.

- Secure the clip.

114. Secure the oil pick-up pipe.

- Tighten the nut to 23 Nm (17 lb.ft).
- Tighten the bolts to 10 Nm (7 lb.ft).

115. NOTE: Only carry out the following step if a new exhaust manifold is to be installed.

Install a new assembly spacer to the exhaust manifold stud number 8.

116. NOTE: Only carry out the following step if a new turbocharger and a new exhaust manifold is to be installed.

Install the 2 new assembly spacers to the turbocharger studs.

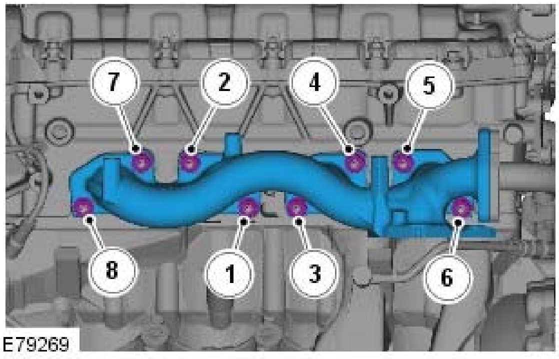
117. Install the LH exhaust manifold and turbocharger assembly.

- Clean the component mating faces.
- Install a new gasket.
- Loosely install the exhaust manifold nuts.

118. ⚠ CAUTION: Install but do not fully tighten the turbocharger support bracket bolts. This will allow for movement of components during the final torque stages. Failure to follow this instruction may result in damage to the vehicle.

Install the LH turbocharger support bracket.

- Install the bolts.



119. ⚠ CAUTION: To make sure that the exhaust manifold and turbocharger assembly is correctly installed and the exhaust manifold nuts are correctly torqued, it is critical that the tightening torque is checked 2 further times after the initial torque has been applied.

• NOTE: Tighten the nuts in the sequence shown.

Secure the LH exhaust manifold and turbocharger assembly.

- Stage 1: Tighten the new nuts to 23 Nm (17 lb.ft).
- Stage 2: Wait for 2 minutes and tighten the nuts to 23 Nm (17 lb.ft).
- Stage 3: Wait for 2 minutes and tighten the nuts to 23 Nm (17 lb.ft).

120. Secure the LH turbocharger support bracket.

- Stage 1: Tighten the LH turbocharger support bracket bolts at the turbocharger to 24 Nm (18 lb.ft).
- Stage 2: Tighten the LH turbocharger support bracket bolts at the cylinder block to 24 Nm (18 lb.ft).

121. Connect the LH turbocharger oil supply pipe.

- Install new sealing washers.
- Tighten the banjo bolt to 24 Nm (18 lb.ft).

122. Secure the LH turbocharger oil return tube.

- Install a new gasket.
- Tighten the bolts to 10 Nm (7 lb.ft).

123. Connect the LH turbocharger electrical connector.

124. Install the LH engine mount bracket.

- Tighten the bolts to 115 Nm (85 lb.ft).

125. Install the EGR valve inlet tubes.

- Clean the component mating faces.
- Install new gaskets.
- Install the RH EGR valve inlet tube heat shield.
- Tighten the bolts to 10 Nm (7 lb.ft).

126. Install the generator mounting bracket.

- Tighten the M10 bolts to 47 Nm (35 lb.ft).
- Tighten the M12 bolt to 80 Nm (59 lb.ft).

127. Install the cooling fan belt tensioner.

- Tighten the bolts to 25 Nm (18 lb.ft).

128. Install the coolant pump pulley and accessory drive belt idler pulleys.

- Tighten the 65 mm idler pulleys to 48 Nm (35 lb.ft).
- Tighten the 80 mm idler pulley to 80 Nm (59 lb.ft).
- Install new access covers.
- Tighten the coolant pump pulley bolts to 25 Nm (18 lb.ft).

129. Install the charge air cooler LH outlet hose.

- Tighten the clip to 5 Nm (3.7 lb.ft).

130. Install the charge air cooler RH outlet hose.

- Tighten the clip to 5 Nm (3.7 lb.ft).

131. Install the special tools.

- Tighten the bolts.

132. Install the RH turbocharger heat shield and the RH exhaust manifold heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

1. CAUTIONS:

   ⚠ Apply grease of the correct specification to the torque converter spigot.

   ⚠ Make sure the torque converter is fully located into the oil pump drive.

   With assistance, carefully install the engine.

   - Clean the component mating faces.

2. ⚠ CAUTION: Make sure the torque converter remains connected to the transmission.

   Secure the engine to the transmission.

   - Tighten the bolts to 45 Nm (33 lb.ft).

3. Secure the RH engine mount vacuum hose to the chassis crossmember.

   - Secure in the clips.

4. Secure the fuel fired booster heater fuel line.

   - Secure the clips.

5. Install the starter motor.
6. Secure both the LH and the RH engine mounts.

   - Lower the engine onto its mounts.
   - Tighten the nuts to 100 Nm (74 lb.ft).
   - Tighten the bolts to 56 Nm (41 lb.ft).

7. Remove the special tools.
8. Install the fuel pump crash protector.

   - Tighten the bolts to 23 Nm (17 lb.ft).
   - Secure the engine wiring harness.

9. Secure the transmission wiring harness bracket to the rear of the engine.

   - Tighten the bolt.

- Secure the camshaft position (CMP) sensor wiring harness clip .

10. NOTE: Remove and discard the blanking caps.

Connect the fuel lines.

11. NOTE: Remove and discard the blanking caps.

• NOTE: Install new O-ring seals.

Secure the transmission fluid lines.

- Tighten the bolt to 6 Nm (4 lb.ft).

12. Secure both the LH and RH downpipe catalytic converters.

- Install new gaskets.
- Tighten the bolts to 21 Nm (15 lb.ft).

13. Secure the engine stabilizer.

- Tighten the nut and bolt to 40 Nm (30 lb.ft).

14. NOTE: Remove and discard the blanking caps.

• NOTE: Install a new O-ring seal.

Connect the A/C compressor high-pressure refrigerant line.

- Tighten the bolt to 10 Nm (7 lb.ft).

15. Secure the power steering pump.

- Tighten the bolts to 23 Nm (17 lb.ft).

16. NOTE: Remove and discard the blanking caps.

• NOTE: Install a new O-ring seal.

Install the A/C compressor low-pressure refrigerant line.

- Tighten the bolt to 10 Nm (7 lb.ft).

17. Secure the fluid pump.

- Tighten the bolts to 23 Nm (17 lb.ft).

18. Install the generator.

- Tighten the bolts to 47 Nm (35 lb.ft).

19. Connect the generator electrical connector.

20. Connect the battery positive cable to the generator.

- Tighten the nut to 22 Nm (16 lb.ft).
- Reposition the rubber insulator.

21. Secure the engine ground cable.

- Tighten the bolt to 47 Nm (35 lb.ft).

22. Connect the auxiliary radiator coolant hose.

23. Secure the coolant hose bracket.

- Tighten the nut 10 Nm (7lb.ft).

24. Connect the transmission cooler pipe to the coolant distribution manifold.

- Secure the clip.

25. Connect the radiator top hose to the coolant distribution manifold.

- Secure the clip.

26. Connect the radiator bottom hose to the coolant distribution manifold.

- Secure the clip.

27. Install the cooling fan shroud.
For additional information, refer to: Cooling Fan Shroud (303-03E Engine Cooling - TDV8 3.6L Diesel, Removal and Installation).

28. Connect the LH charge air cooler outlet pipe.

- Tighten the clip.

29. Install the body.
For additional information, refer to: Body - TDV8 3.6L Diesel (502-02 Full Frame and Body Mounting, Removal and Installation).

30. Connect the RH charge air cooler inlet pipe.

- Tighten the clip.

31. Install the front RH splash shield.

- Install the clips.

32. Connect the LH charge air cooler inlet pipe.

- Tighten the clip.

33. Install the front LH splash shield.

- Install the clips.

34. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

35. NOTE: Remove and discard the blanking caps.

Secure the transmission fluid lines to the transmission fluid cooler.

- Secure the clips.

36. ⚠ CAUTION: Make sure that new bolts are installed.

Secure the flexplate to the torque converter.

- Tighten the bolts to 45 Nm (33 lb.ft).

37. Secure the starter motor.

- Tighten the bolts to 45 Nm (33 lb.ft).
- Tighten the transmission bolt to 45 Nm (33 lb.ft).

38. Connect the switch lead to the starter motor solenoid.

- Tighten the nut to 4 Nm (3 lb.ft).

39. Connect the battery positive cable to the starter motor solenoid.

- Tighten the nut to 22 Nm (16 lb.ft).
- Install the cap.

40. Install the splash shield.

- Install the clips.

41. Secure the battery positive cable.

- Secure the clip.
- Tighten the bolts.

GENERAL

The cooling system employed is of the pressure relief by-pass type, which allows coolant to circulate around the engine and the heater circuit while the thermostat main valve is closed. The primary function of the cooling system is to maintain the engine within an optimum temperature range under changing ambient and engine operating conditions. Secondary functions are to provide heating for the passenger compartment and cooling for the transmission fluid and engine oil.

The cooling system comprises:

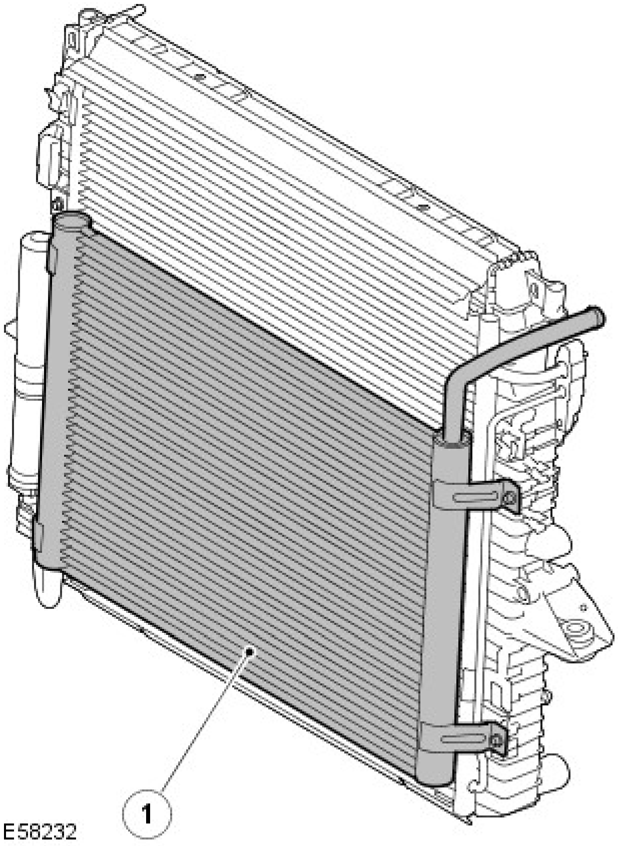
- A cooling module including common radiator, condenser, transmission oil cooler with additional charge air radiator
- A passenger compartment heater matrix
- An engine driven coolant pump
- An electric coolant pump
- A thermostat
- An expansion tank
- An electro-viscous cooling fan
- Transmission oil pipes
- Engine oil coolers
- Connecting hoses and pipes.

ENGINE COOLING SYSTEM

A centrifugal pump mounted on the front of the engine and driven by an ancillary drive 'polyvee' belt circulates the coolant. The engine driven coolant pump circulates coolant through the cylinder block and cylinder heads via a chamber located in the 'vee' of the engine. Having passed through the engine the coolant returns to the thermostat housing. The coolant then progresses down the 'top hose' to the heater pipe. The heater pipes lead to the bulkhead and return to the engine side of the thermostat.

The engine contains a normal thermostat, which is positioned such that the wax's temperature is controlled by both the coolant from the radiator and the bypass. This results in the thermostat being able to vary its opening temperature dependant on ambient conditions. The thermostat housing also contains a sprung loaded valve, which limits the amount flow using the bypass. This means that the engine can run without coolant flowing through the bypass temporarily, to improve heater performance.

The engine radiator is a cross flow type with an aluminium matrix and has a drain tap on the lower right-hand rear face. There is an additional charge air radiator, located in front of the engine radiator, to support the water charge air coolers on the engine.



Item	Part Number	Description
1	-	Charge air radiator

The coolant for the charge air cooling is driven by an electric pump at constant speed and is mounted on the engine radiator end tank. This circuit shares the engine coolant via a vortex connection, in the engine to radiator hose. The lower engine radiator mountings are located part way up the end tanks. The mountings are fitted with rubber bushes, which sit on the upper chassis rails. The radiator upper is mounted by pins, which are pushed through rubber bushes mounted in the Front End Carrier (FEC) above the radiator. The radiator also incorporates two connections for the transmission oil pipes.

The top and bottom hoses are mounted to the inlet and outlet sides of the thermostat housing.

The expansion tank is fitted forward of the LH suspension turret in the engine compartment. The expansion tank allows for the expansion of the coolant as the engine gets hot and also supplies the engine with coolant as the coolant in the engine contracts. The tank also allows any air trapped in the coolant to be removed.

The liquid cooled transmission fluid cooler is mounted in the cold side radiator end tank. It is positioned in the middle of the LH end tank.

There are two engine oil coolers working in parallel. The first engine oil cooler is fed coolant from the bottom hose. Coolant is diverted from between the radiator and the thermostat, directed to the cooler and then returned to the bottom hose. The second engine oil cooler is cooled by air and is mounted in front of the RH front wheel.

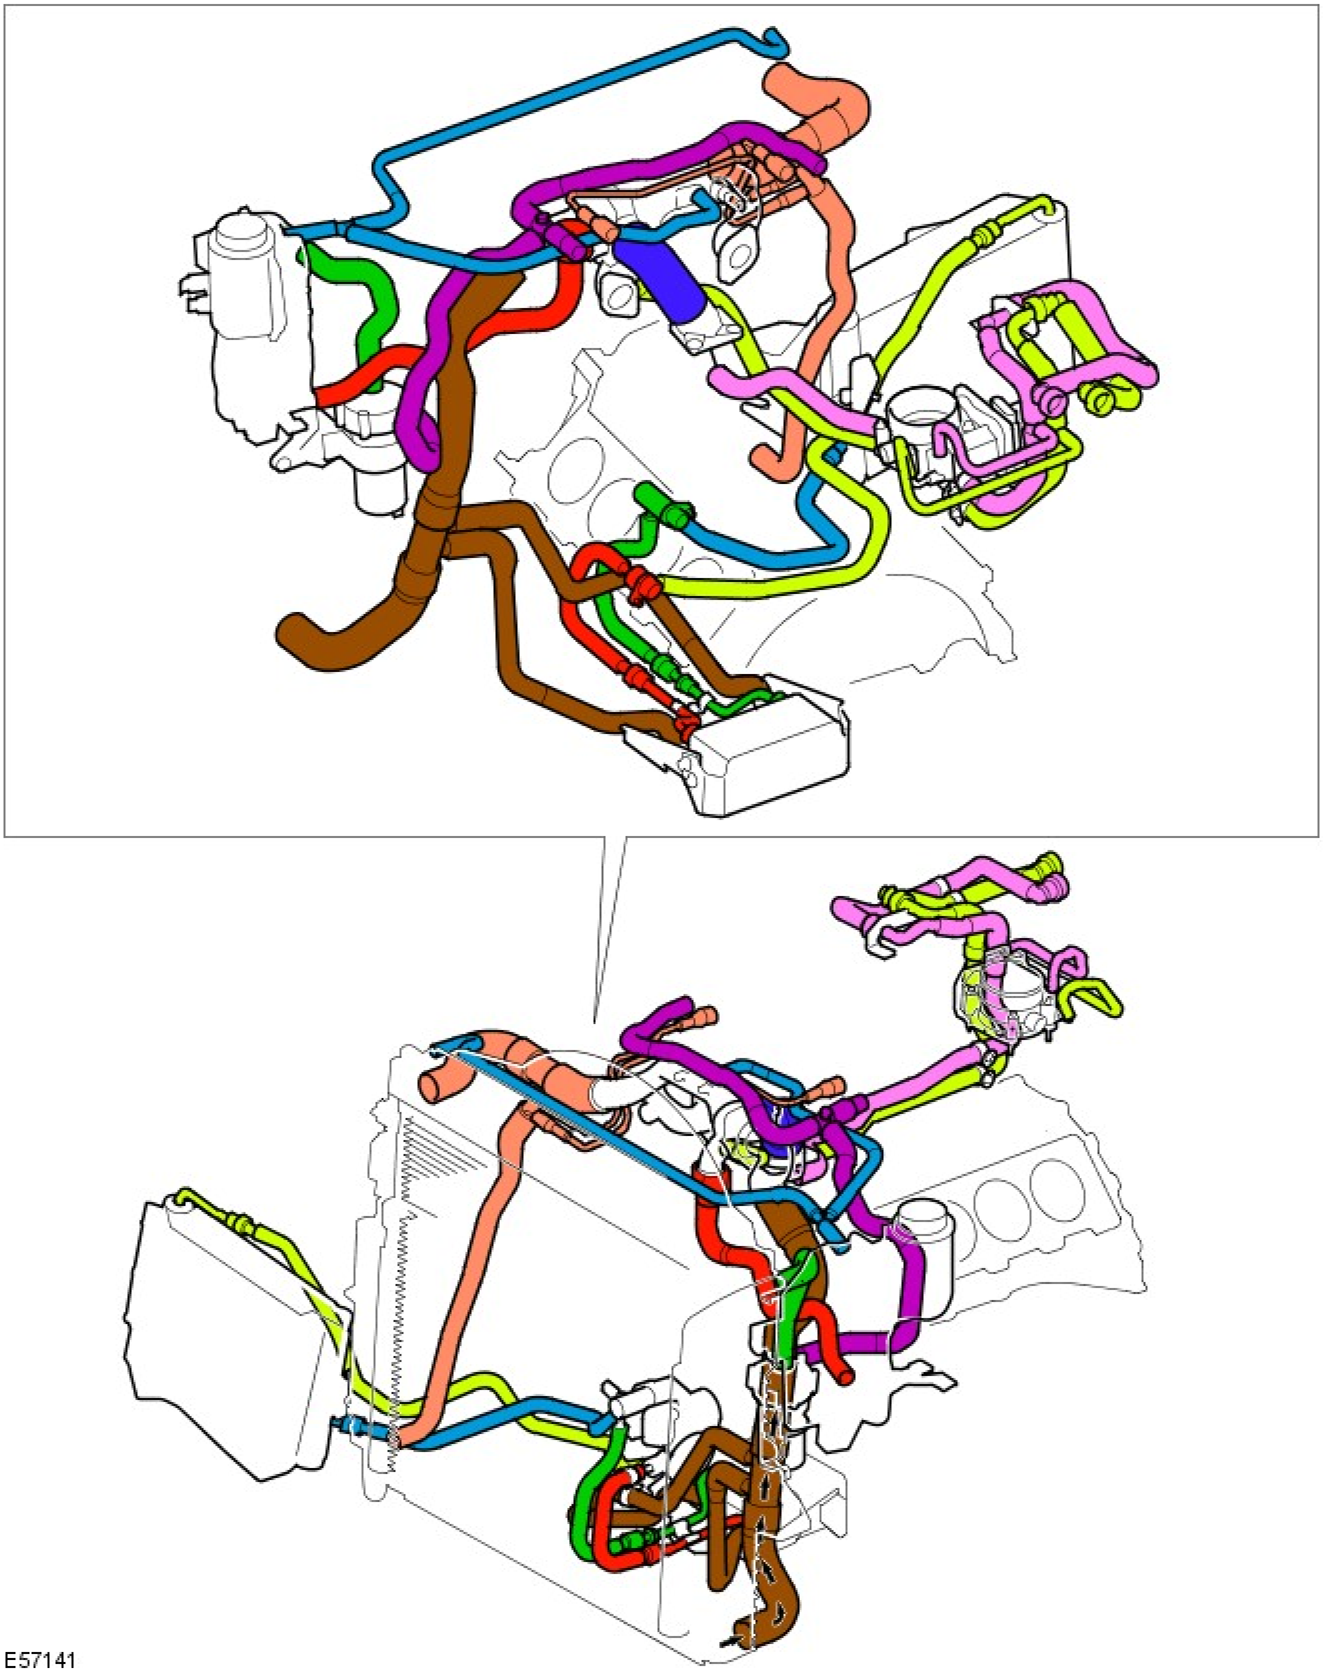
For additional airflow through the radiator matrix, particularly when the vehicle is stationary, there is an engine driven electro-viscous unit. This unit functions as a normal viscous fan, but with electronic control over the level engagement of the clutch. The Engine Control Module (ECM), which determines the required fan speed, controls the level of clutch engagement. The ECM determines engagement based on the coolant, ambient and transmission oil temperatures and air conditioning (A/C) system pressure. The fan is mounted using a left hand thread.

The viscous fan unit is electronically controlled by the ECM to optimise fan speed for all operating conditions.

• NOTE: If the electrical connections to the viscous fan are disconnected the fan will 'idle' and overheating may result. The ECM stores the appropriate fault codes in this case.

ENGINE COOLING SYSTEM OPERATION

Cooling System Coolant Flow



E57141

When the engine is running the coolant pump is driven by the ancillary drive belt. This forces coolant to circulate around the engine and heater, while the thermostat and bypass valve are shut. As the temperature and pressure increases the bypass valve is forced open allowing coolant to circulate through the bypass valve. When the temperature reaches 82°C (180°F) the main thermostat begins to open allowing coolant to circulate through the main radiator. As the thermostat progressively opens (fully open at 95°C (203°F)), the bypass valve progressively closes forcing any coolant through the heater or radiator. Once coolant is allowed to circulate through the radiator, the transmission fluid and the engine oil coolers begin to receive coolant flow.

The increased coolant volume, created by heat expansion, is directed to the expansion tank through a bleed hose from the top of the radiator. The expansion tank has an outlet hose, which is connected into the coolant circuit. This outlet hose returns the coolant to the system when the engine cools.

Coolant flows through the radiator from the top right hand tank to the bottom left hand tank and is cooled by air passing through the matrix. The temperature of the cooling system is monitored by the ECM via the Engine Coolant temperature (ECT) sensor located in the cylinder head. The ECM uses signals from this sensor to control the cooling fan operation and adjust fuelling according to engine temperature.
For additional information, refer to: Electronic Engine Controls (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, Description and Operation).

To control the cooling fan, the ECM sends a Pulse Width Modulated (PWM) signal to the cooling fan module (integral to the ECM). The frequency of the PWM signal is used by the cooling fan module to determine the output voltage supplied to the fan motor.

The ECM varies the duty cycle of the PWM signal between 0 and 100% to vary the fan speed. If the PWM signal is outside the 0 to 100% range, the cooling fan module interprets the signal as an open or short circuit and runs the fans at maximum speed to ensure the engine and gearbox do not overheat.

The ECM operates the fan in response to inputs from the ECT sensor, the transmission oil temperature sensor, the A/C switch and the A/C pressure sensor.
For additional information, refer to: Air Conditioning (412-03A Air Conditioning - V8 S/C 4.2L Petrol, Description and Operation).

The speed of the cooling fan is also influenced by vehicle road speed. The ECM adjusts the speed of the cooling fans, to compensate for the ram effect of vehicle speed, using the Controller Area Network (CAN) road speed signal received from the Anti-lock Braking System (ABS) module.

Diagnosis and Testing

Inspection and verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
● Coolant leaks ● Coolant Hoses ● Coolant expansion tank ● Radiator ● Heater core ● Accessory drive belt ● Viscous fan	● Fuses ● Wiring harness ● Loose or corroded connector(s) ● Engine coolant temperature (ECT) sensor

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
   - Make sure that all DTCs are cleared following rectification

Symptom chart

Symptom	Possible cause	Action
Coolant loss	● Hoses ● Hose connections ● Radiator ● Water pump ● Heater core ● Gaskets ● Engine casting cracks ● Engine block core plugs	Carry out a visual inspection. If there are no obvious leaks, carry out a pressure test using your workshop tester. Rectify as necessary.
Overheating	● Low/Contaminated coolant ● Thermostat ● Viscous fan ● ECT sensor ● Restricted air flow over the radiator	Check the coolant level and condition. Check the thermostat and rectify as necessary. Carry out a cooling system pressure test. Refer to the relevanat section of the workshop manual. Check the viscous fan operation, make sure the viscous fan rotates freely. Check for obstructions to the air flow over the radiator.
Engine not reaching normal temperature	● Thermostat ● Viscous fan	Check the thermostat operation. Check the viscous fan operation, make sure the viscous fan is not seized.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
P011623	Engine Coolant Temperature Sensor 1 Circuit Range/Performance	● Low coolant level ● Engine thermostat failure ● ECT sensor sensing circuit intermittent high resistance ● ECT sensor failure	Check the coolant level and the thermostat operation (stuck open). Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P011624	Engine Coolant Temperature Sensor 1 Circuit Range/Performance	● Low coolant level ● Engine coolant thermostat failure ● ECT sensor sensing circuit intermittent high resistance ● ECT sensor failure	Check the coolant level and the thermostat operation (stuck closed). Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011629	Engine Coolant Temperature Sensor 1 Circuit Range/Performance	● Low coolant level ● Engine coolant thermostat failure ● ECT sensor sensing circuit intermittent high resistance ● ECT sensor failure	Check the coolant level and the thermostat operation. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011700	Engine Coolant Temperature Sensor 1 Circuit Low	● ECT sensor disconnected ● Engine coolant temperature (ECT) sensor sensing circuit high resistance, short circuit to power ● ECT sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011800	Engine Coolant Temperature Sensor 1 Circuit High	● Engine overheat condition/cooling fan failure ● ECT sensor wiring short circuit to ground ● ECT sensor failure	Check the coolant level and the thermostat operation (stuck closed). Check for cooling fan DTCs. Refer to the guided diagnostic routine for this code on the approved diagnostic system.

Engine Cooling - V8 S/C 4.2L Petrol - Cooling System Draining, Filling and Bleeding

General Procedures

⚠WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

1. Position the vehicle on a lift.

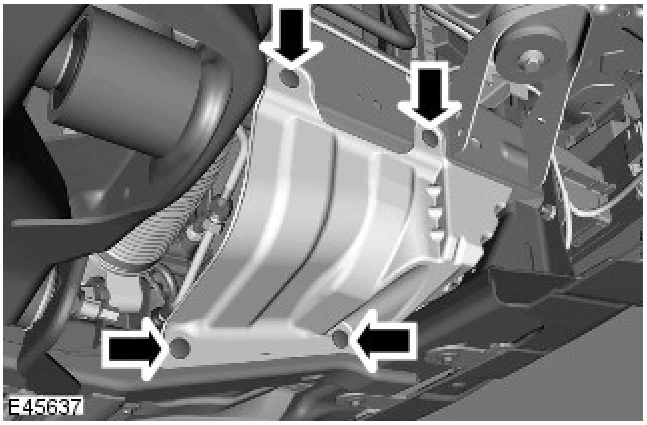
2. Set the heater controls to maximum.

3. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

4. Remove the engine cover.
For additional information, refer to: Engine Cover - V8 S/C 4.2L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).

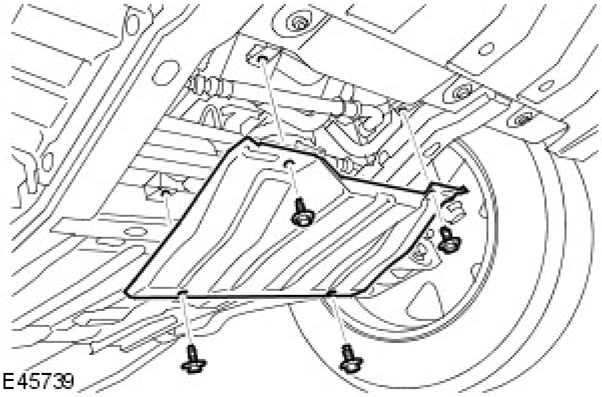
5. ⚠WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

Remove the coolant expansion tank cap.



6. Remove the front RH and LH splash shields.

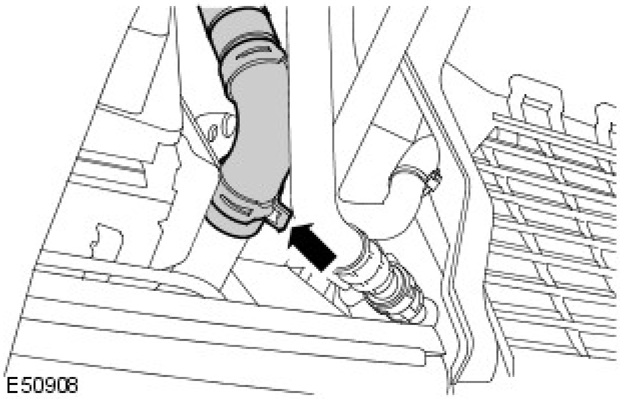
- Remove the 4 clips.



7. Remove the radiator access panel.

- Remove the 4 bolts.

8. Position a container to collect the fluid.

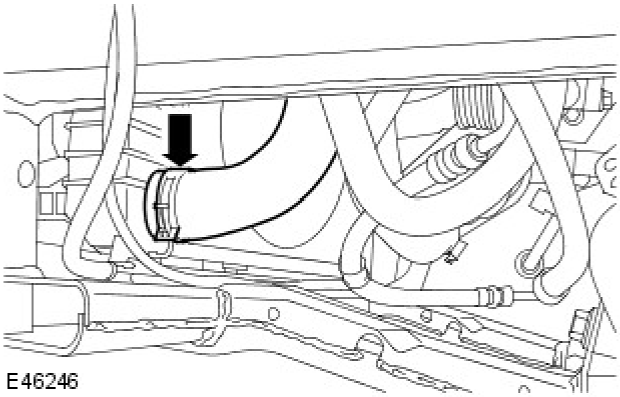


E50908

9. ⚠ CAUTION: Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

Disconnect the charge air radiator lower hose.

- Release the clip.
- Allow the coolant to drain.



E46246

10. Disconnect the radiator lower hose.

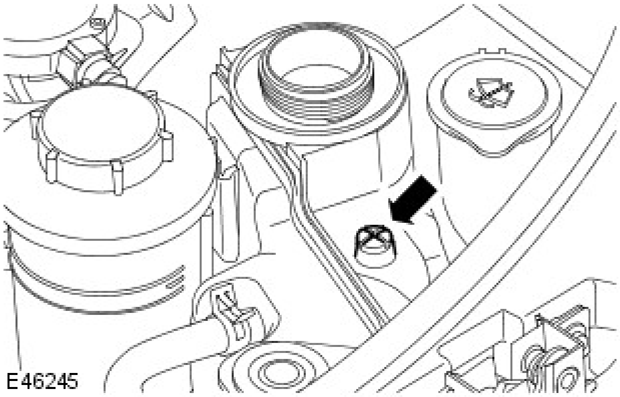
- Release the clip.
- Allow the coolant to drain.
- Remove the container.

11. Connect the lower hoses to the radiators.

- Secure the clips.

12. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

13. Connect exhaust extraction hoses to the tail pipes.



E46245

14. ⚠ CAUTION: Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

Refill and bleed the cooling system.

- Remove the coolant expansion tank cap.
- Loosen the coolant expansion tank bleed screw.
- Add coolant to the expansion tank as required, until the upper level mark is achieved.

15. ⚠ CAUTION: Damage to the charge air cooler coolant pump will occur if the pump is allowed to cavitate.

• NOTE: Turning the ignition key to position II will run the electric coolant pump.

Set the heating system to MAX heat, the blower motor to MAX speed and the air distribution to the instrument panel registers.

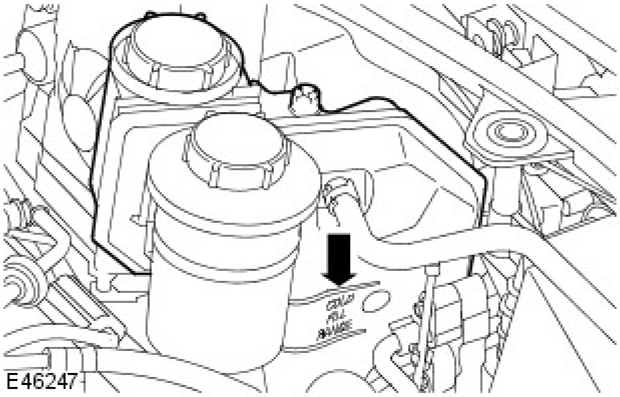
- Loosen the coolant bleed screw adjacent to the charge air cooler.
- Turn the ignition key to position II.
- When coolant runs from the bleed point bubble-free, tighten the bleed screw.

16. Start the engine and allow to idle.

- When coolant runs from the expansion tank bleed point bubble-free, tighten the bleed screw.
- Top-up the expansion tank to the upper level mark.
- Install the coolant expansion tank cap.
- Increase the engine speed to 2000 RPM, and maintain, until no air is seen returning to the expansion tank.

17. Switch the engine off and allow to cool.

18. Check for leaks and then fill the coolant expansion tank to the MAX mark.



19. Install the engine cover.
For additional information, refer to: Engine Cover - V8 S/C 4.2L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).

20. Clean any spilt coolant from the vehicle.

21. Install the radiator access panel.

- Tighten the 4 bolts to 10 Nm (7 lb.ft).

22. Install the splash shields.

23. Disconnect the exhaust extraction hoses from the tail pipes.

Engine Cooling - V8 S/C 4.2L Petrol - Cooling System Pressure Test

General Procedures

• NOTE: The following procedure will enable the cooling system to be pressure tested for condition and leaks. Stage 1 will check the expansion tank cap register seal and the cap for leaks. Stage 2 will check the entire cooling system.

• NOTE: It will be necessary to use the cooling system test kit, Part Number LR-218, which is available under the equipment programme.

1. Examine the coolant hoses for signs of cracking, distortion and security of the hose connections.

2. WARNING: Since injury such as scalding could be caused by escaping steam or coolant, allow the vehicle cooling system to cool prior to carrying out this procedure.

Disconnect the coolant expansion tank bleed hose.

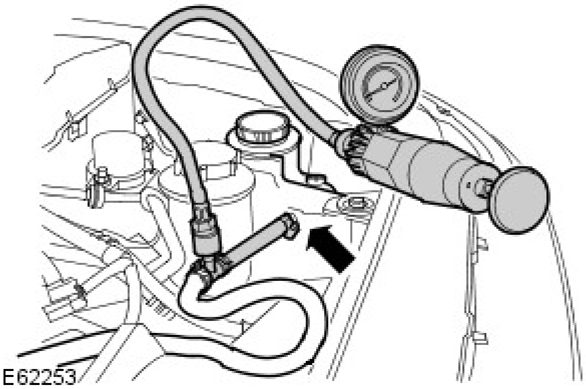
- Release the clip.

3. Install the 'T' piece adaptor (part of the cooling system test kit) between the coolant expansion tank and the coolant bleed hose.

- Secure with the 2 clips.

4. Install the coolant pressure pump assembly.

- Connect to the 'T' piece.



5. Pressurize the cooling system.

- Slowly pressurize the cooling system to 1.0 bar (100 kPa) (14.5 psi).
- Check the pressure remains above 0.9 bar (90 kPa) (13 psi) after waiting for 30 seconds.
- During the pressure drop check, listen for a hissing noise from the expansion tank cap.

6. NOTE: If the coolant expansion tank cap is found to be leaking, replace the cap.

Depressurize the cooling system.

- Disconnect the 'T' piece.
- Connect the coolant expansion tank bleed hose.
- Secure the clip.

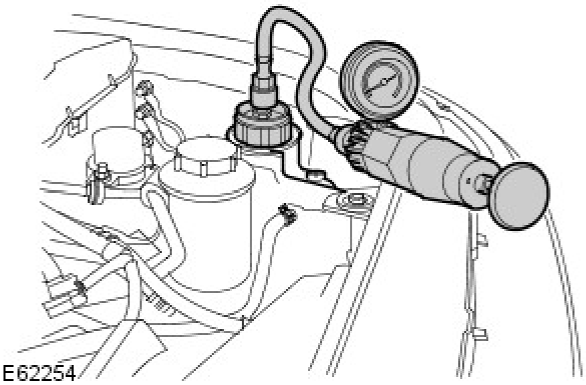
7. WARNING: Since injury such as scalding could be caused by escaping steam or coolant, allow the vehicle cooling system to cool prior to carrying out this procedure.

Remove the coolant expansion tank cap.

8. NOTE: This adaptor is part of the cooling system test kit.

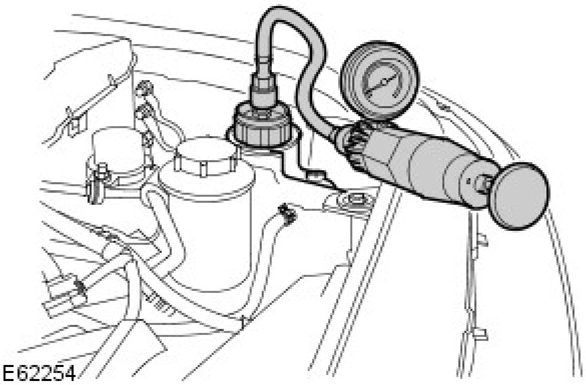
Install adaptor K83 to the coolant expansion tank.

- Clean the component mating faces.
- Lubricate the seal.



9. Install the coolant pressure pump assembly.

- Slowly pressurize the cooling system to 1.5 bar (150kPa) (22 psi), check the pressure over a 5 minute period. A small pressure decay of approximately 0.15 bar (15 »kPa) (1 psi) over the first minute is normal, as the air in the expansion tank cools.
- If the pressure continues to drop after the initial tolerance, there is a coolant leak.



10. Depressurize and remove the pressure pump and gauge.

- Install the coolant expansion tank cap.

Removal and Installation

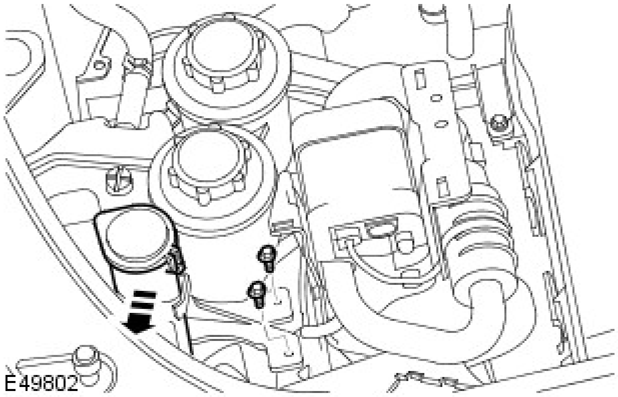
Removal

1. Remove the LH headlamp assembly.
For additional information, refer to: Headlamp Assembly (417-01 Exterior Lighting, Removal and Installation).

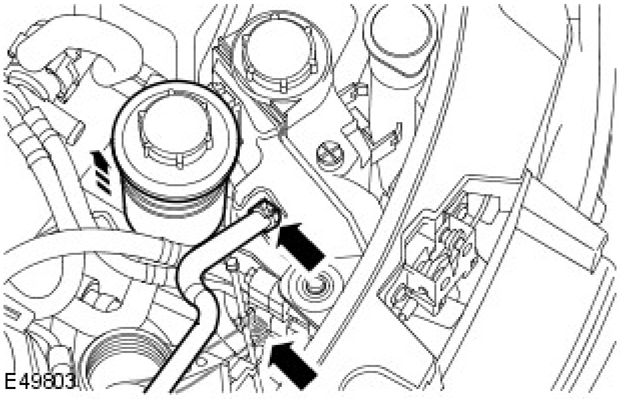
2. Release the windshield washer reservoir filler neck.

3. Release the coolant expansion tank.

- Remove the 2 bolts.



4. Release the power steering fluid reservoir.



5. ⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

⚠ CAUTION: Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

Disconnect the 2 hoses from the coolant expansion tank.

- Position an absorbent cloth to collect fluid spillage.
- Position a container to collect the fluid.
- Clamp the hoses
- Release the 2 clips.

6. Remove the coolant expansion tank.

- Disconnect the coolant low level sensor electrical connector.

7. NOTE: Do not disassemble further if the component is removed for access only.

Remove the coolant low level sensor.

- Remove the coolant expansion tank support bracket.

Installation

1. Install the bracket.

2. Install the coolant low level sensor.

3. Install the coolant expansion tank.

- Connect the coolant low level sensor electrical connector.

4. Connect the coolant hoses to the expansion tank.

- Secure with the clips.

5. Top-up the coolant.

- Loosen the coolant expansion tank bleed screw.
- Fill the coolant expansion tank until coolant emerges from the cooling system air bleed screw.
- Remove the hose clamps.
- Tighten the bleed screw to 8 Nm (6 lb.ft).

6. Secure the coolant expansion tank.

- Tighten the bolts to 10 Nm (7 lb.ft).

7. Check and top-up the coolant.

- Install the coolant expansion tank pressure cap.

8. Secure the power steering fluid reservoir.

- Attach to the mounting bracket.

9. Secure the windshield washer reservoir filler neck.

- Locate in clip.

10. Install the LH headlamp assembly.

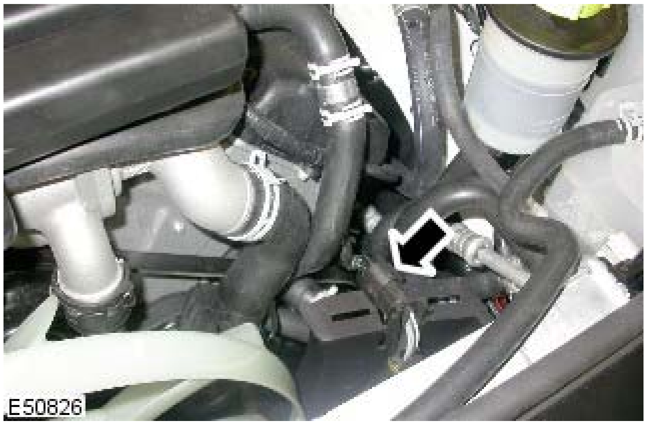
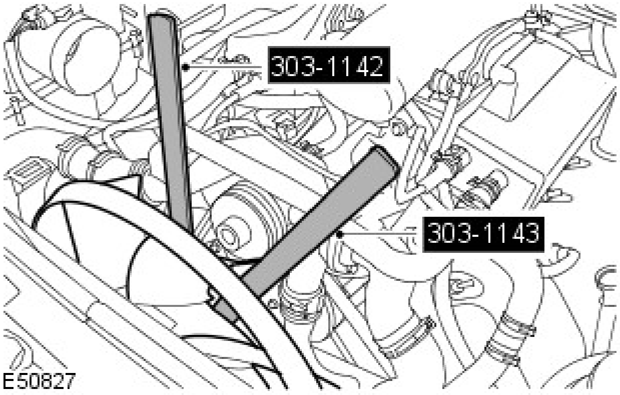
3. Disconnect the cooling fan control electrical connector.

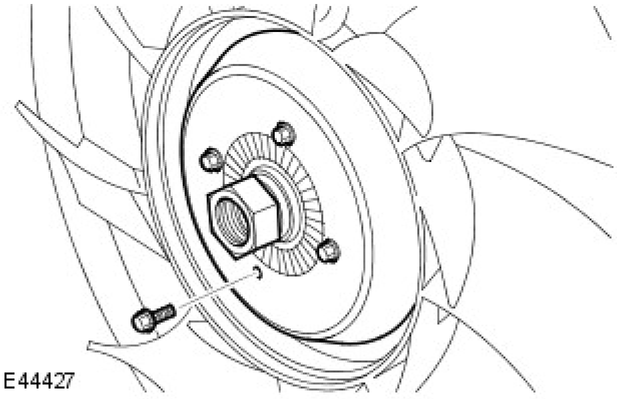


4. NOTE: The thread is right handed.

   Using the special tools, remove the cooling fan.

   - Remove the cooling fan assembly.





5. NOTE: Do not disassemble further if the component is removed for access only.

Remove the viscous coupling from the cooling fan.

- Remove the 4 bolts.

Installation

1. To install, reverse the removal procedure.

- Install the cooling fan to the viscous coupling, tighten the bolts to 10 Nm (7 lb.ft).
- Tighten the cooling fan assembly to 65 Nm (48 lb.ft).

Engine Cooling - V8 S/C 4.2L Petrol - Cooling System Draining and Vacuum Filling

General Procedures

⚠ WARNING: To avoid having scalding hot coolant or steam blowing out of the cooling system, use extreme care when removing the coolant pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant pressure cap and turn it slowly until the pressure begins to release. Step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant pressure cap from the coolant expansion tank. Failure to follow these instructions may result in personal injury.

- CAUTIONS:

⚠ The engine cooling system must be maintained with the correct concentration and type of anti-freeze solution to prevent corrosion and frost damage. Failure to follow this instruction may result in damage to the vehicle.

⚠ Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

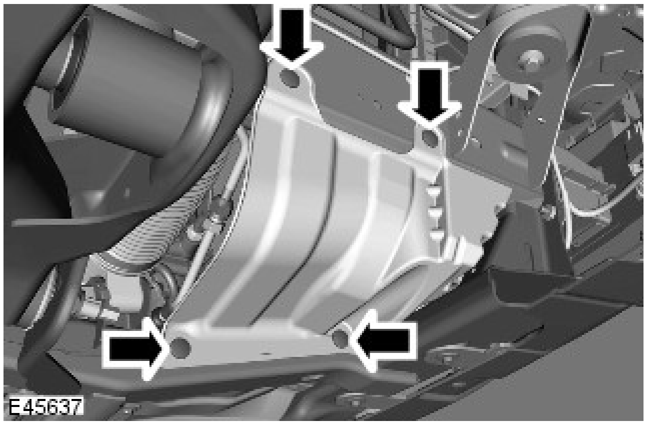
1. Set the heater controls to maximum HOT.

2. ⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

Remove the coolant expansion tank cap.

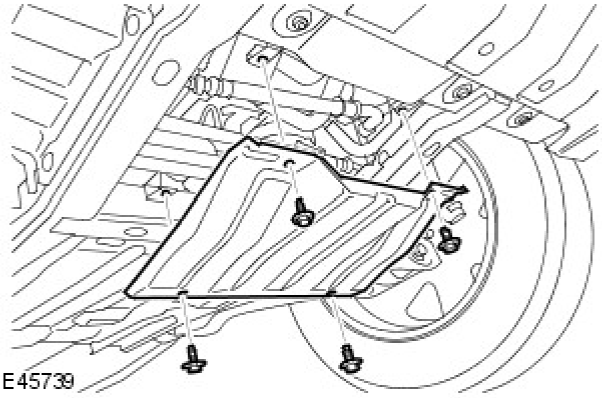
3. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.



4. Remove the front LH splash shield.

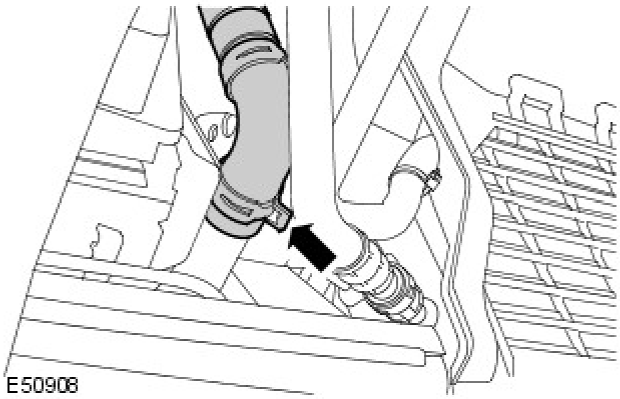
- Remove the 4 clips.



5. Remove the radiator access panel.

- Remove the 4 bolts.

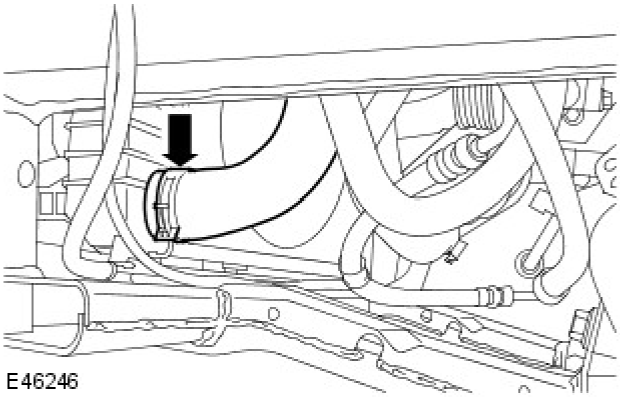
6. Position a container to collect the fluid.



7. CAUTION: Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

Disconnect the charge air radiator lower hose.

- Release the clip.
- Allow the coolant to drain.



8. Disconnect the radiator lower hose.

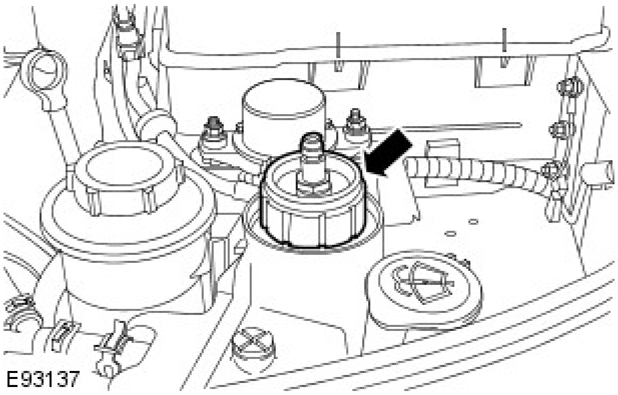
- Release the clip.
- Allow the coolant to drain.

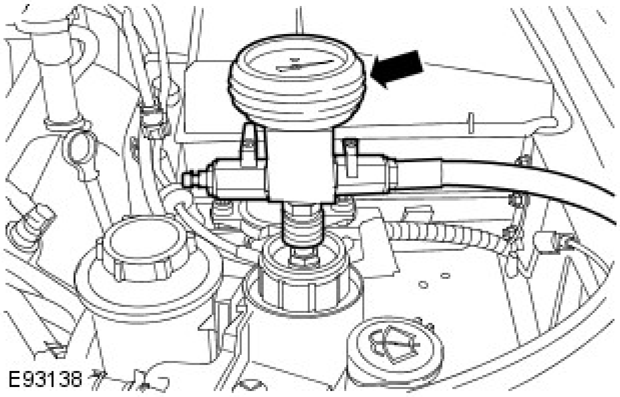
9. Connect the lower hoses to the radiators.

- Secure the clips.
- Remove the container.

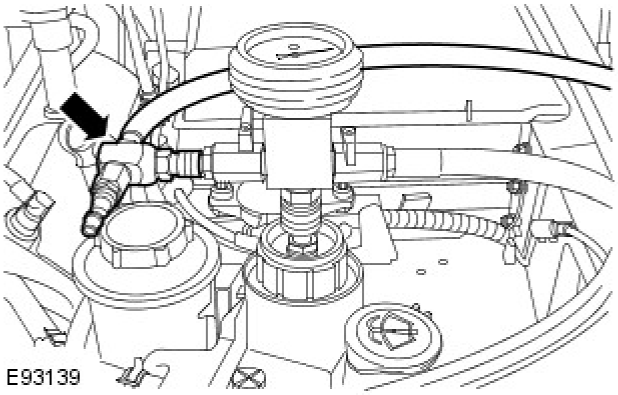
10. Prepare a sufficient amount of coolant to the specified concentration.

11. Install the cooling system vacuum refill adaptor to the expansion tank.

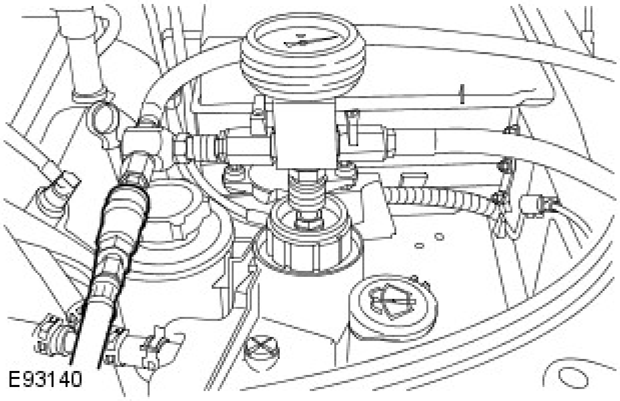




12. Install the vacuum filler gauge to the cooling system vacuum refill adaptor.



13. Install the venturi tube assembly to the vacuum filler gauge.



14. NOTE: Make sure both valves on gauge assembly are in the closed position.

- NOTE: Small diameter or long airlines may restrict airflow to the coolant vacuum fill tool.

- NOTE: The coolant vacuum fill tool needs an air pressure of 6 to 8 bar (87 to 116 psi) to operate correctly.

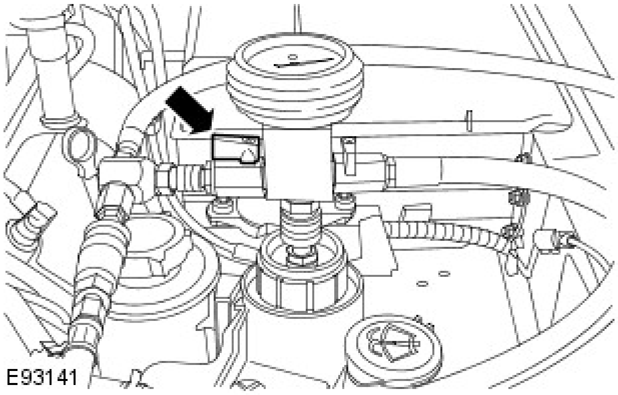
Connect a regulated compressed air supply to the venturi tube assembly.

15. NOTE: Make sure air cannot enter the hose.

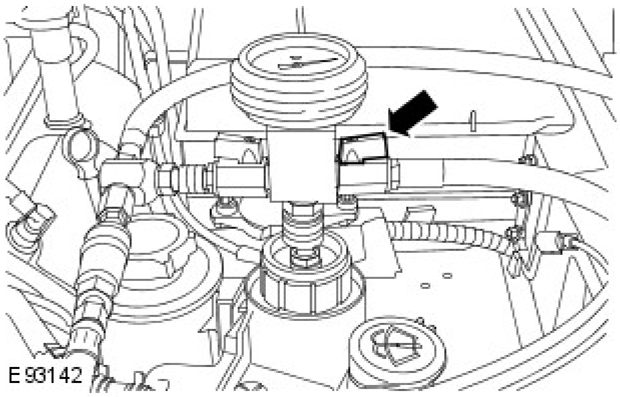
Position the coolant pick-up pipe into a container of clean coolant.

16. Position the evacuated air hose into a container.

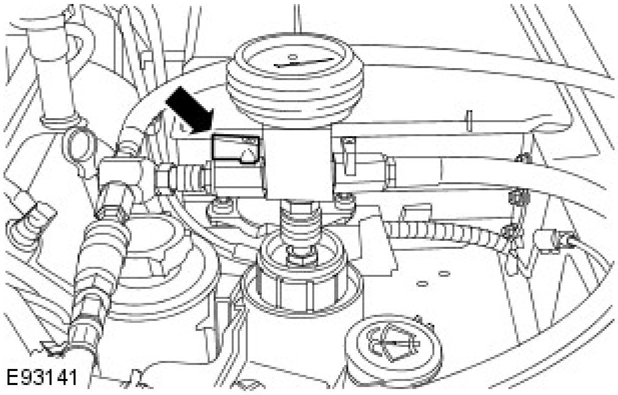
17. Open the air supply valve.



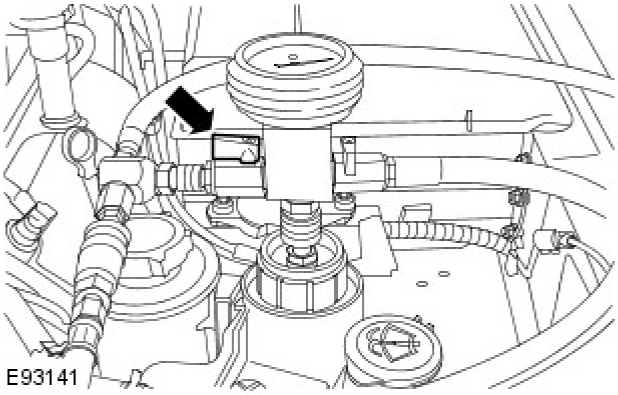
18. Open the coolant supply valve for 2 seconds to prime the coolant supply hose.

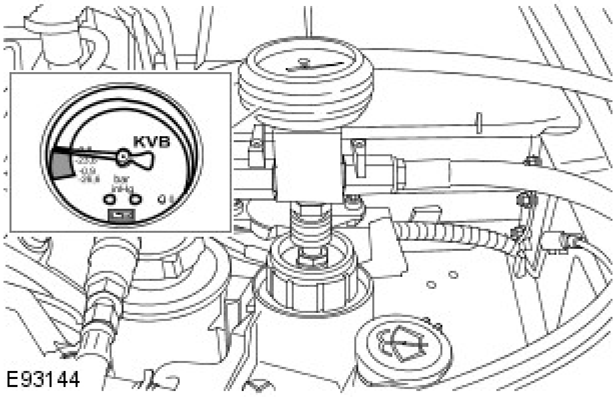


19. Apply air pressure progressively until the arrow on the vacuum filler gauge reaches the green segment.



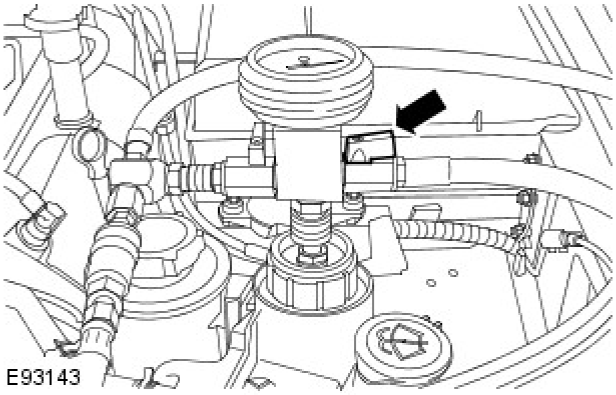
20. Close the air supply valve.





21. Allow one minute to check the vacuum is held.

- Disconnect the compressed air supply.



22. NOTE: Close the coolant supply valve when the coolant expansion tank MAX mark is reached or coolant movement has ceased.

Open the coolant supply valve and allow the coolant to be drawn into the system.

23. Remove the vacuum filler gauge and cooling system vacuum refill adaptor assembly.

24. Check and top-up the coolant if required.

25. Install the coolant expansion tank cap.

26. ⚠CAUTION: Observe the engine temperature gauge. If the engine starts to over-heat switch off immediately and allow to cool. Failure to follow this instruction may cause damage to the vehicle.

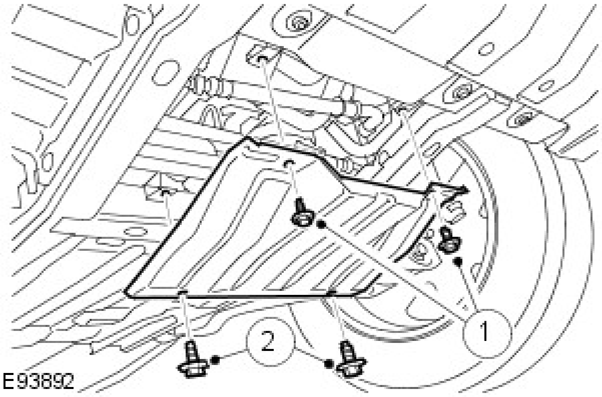
Start and run the engine until normal operating temperature is reached.

27. Switch the engine off and allow to cool.

28. Clean any spilt coolant from the vehicle.

29. Install the radiator access panel.

1. Tighten the bolts to 10 Nm (7 lb.ft).
2. Tighten the bolts to 62 Nm (46 lb.ft).



30. Install the front LH splash shield.

- Install the 4 clips.

GENERAL

The cooling system employed is of the pressure relief by-pass type, which allows coolant to circulate around the engine and the heater circuit while the thermostat main valve is closed. The primary function of the cooling system is to maintain the engine within an optimum temperature range under changing ambient and engine operating conditions. Secondary functions are to provide heating for the passenger compartment and cooling for the transmission fluid and engine oil.

The cooling system comprises:

- A radiator
- A passenger compartment heater matrix
- A coolant pump
- A thermostat
- An expansion tank
- An electro-viscous fan
- Connecting hoses and pipes.

ENGINE COOLING SYSTEM

The coolant is circulated by a centrifugal pump mounted on the front of the engine and driven by an ancillary drive 'polyvee' belt. The coolant pump circulates coolant through the cylinder block and cylinder heads via a chamber located in the 'vee' of the engine. Having passed through the engine the coolant returns to the thermostat housing. The coolant then progresses down the 'top hose' to the heater pipe. The heater pipes lead to the bulkhead and return to the engine side of the thermostat.

The engine contains a normal thermostat, which is positioned such that the wax's temperature is controlled by both the coolant from the radiator and the bypass. This results in the thermostat being able to vary its opening temperature dependant on ambient conditions. The thermostat housing also contains a sprung loaded valve, which limits the amount of coolant using the bypass. This means the engine can run without coolant flowing through the bypass temporarily, to improve heater performance.

The radiator is a cross flow type with an aluminium matrix and has a drain tap on the lower right-hand rear face. The lower radiator mountings are located part way up the end tanks. The mountings are fitted with rubber bushes, which sit on the upper chassis rails. The radiator upper is mounted by pins, which are pushed through rubber bushes mounted in the Front End Carrier (FEC) above the radiator. The radiator also incorporates two connections for the transmission oil pipes.

The top and bottom hoses are mounted to the inlet and outlet sides of the thermostat housing.

The expansion tank is fitted forward of the LH suspension turret in the engine compartment. The expansion tank allows for the expansion of the coolant as the engine gets hot. It also supplies the engine with coolant as the coolant in the engine contracts. The tank also allows any air trapped in the coolant to be removed.

The liquid cooled transmission fluid cooler is mounted in the cold side radiator end tank. It is positioned in the middle of the LH end tank.

The engine oil cooler (EOC) is fed coolant from the bottom hose. Coolant is diverted from between the radiator and the thermostat, directed to the cooler and then returned to the bottom hose.

For additional airflow through the radiator matrix, particularly when the vehicle is stationary, there is an engine driven electro-viscous unit. This unit functions as a normal viscous fan, but with electronic control over the level engagement of the clutch. The

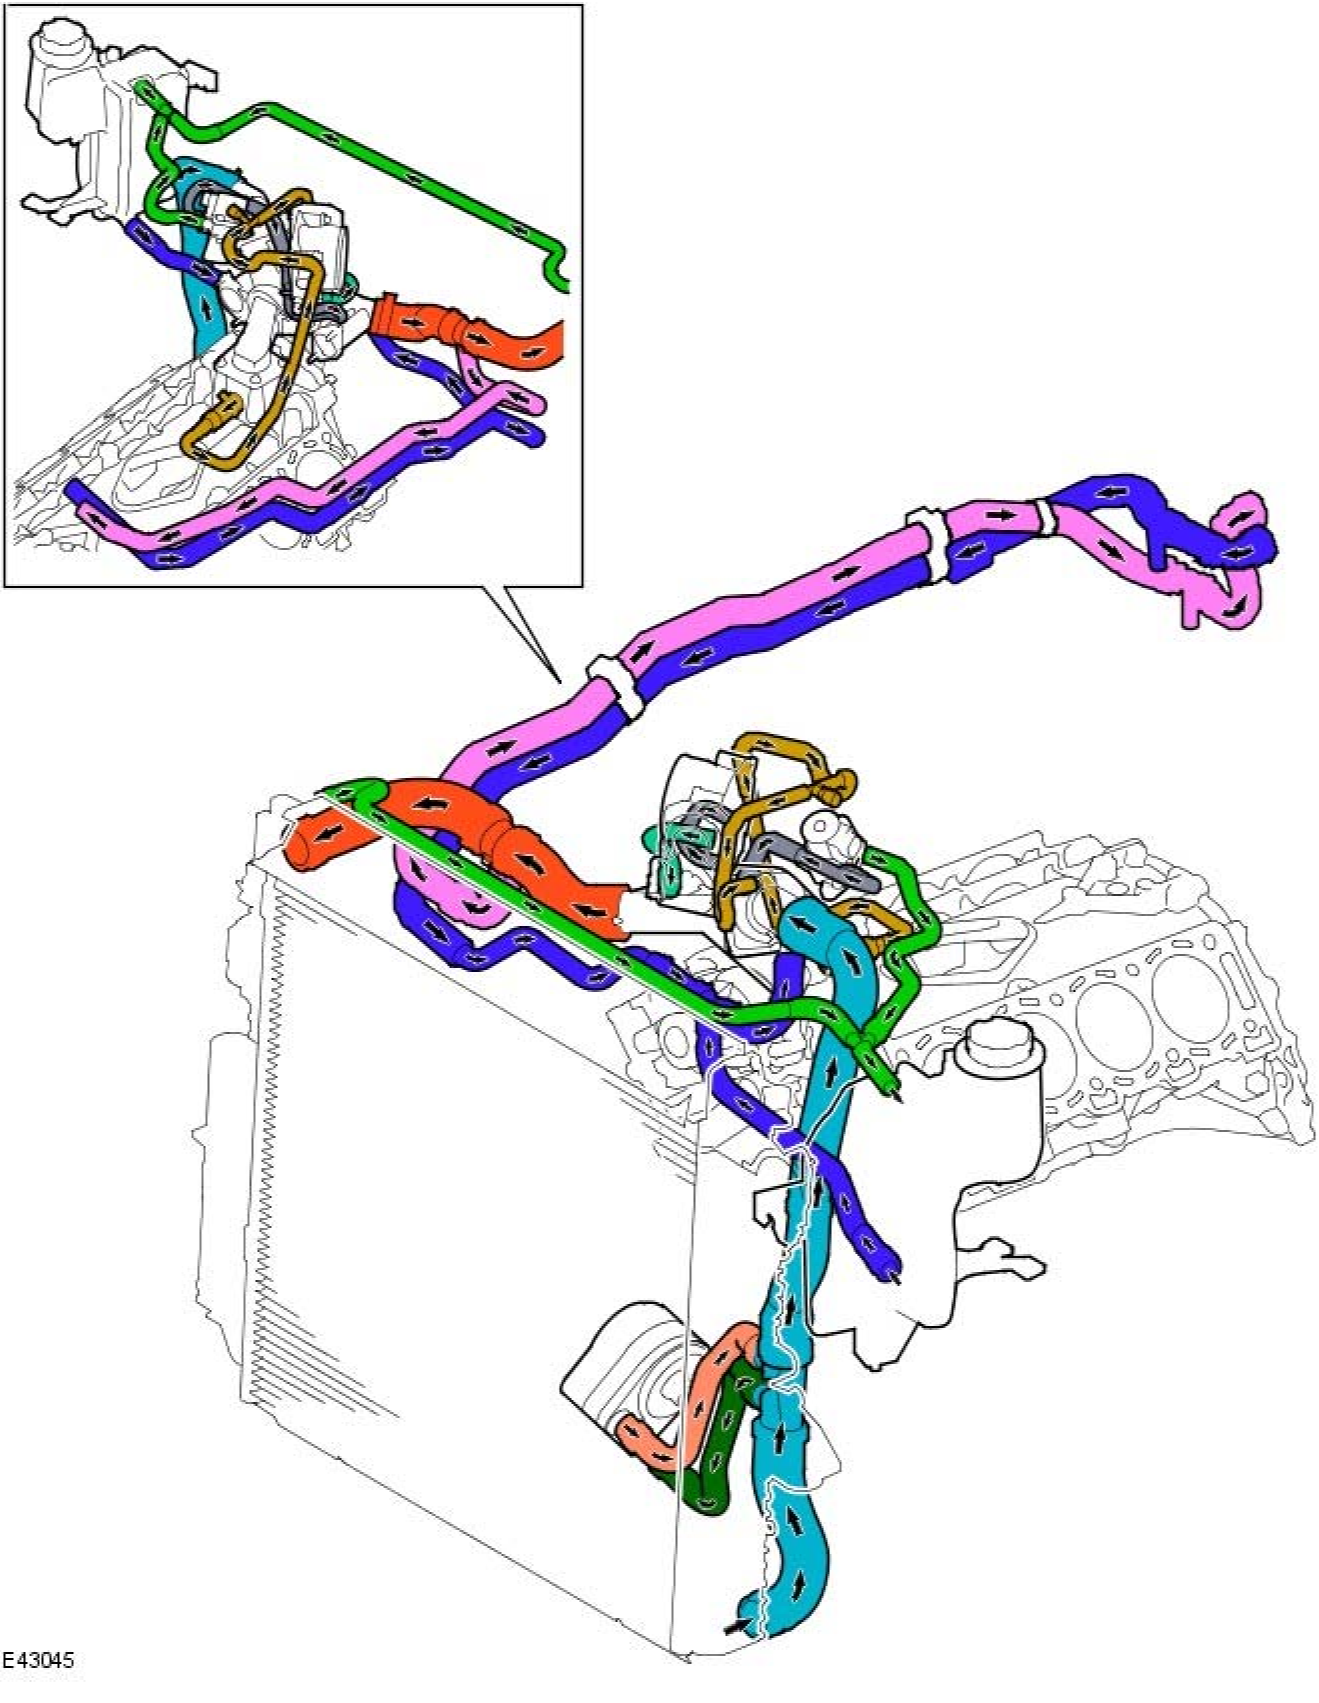
Engine Control Module (ECM), which determines the required fan speed, controls the level of clutch engagement. The ECM determines engagement based on the coolant, ambient and transmission oil temperatures and air conditioning (A/C) system pressure. The fan is mounted using a left hand thread.

The viscous fan unit is electronically controlled by the ECM to optimise fan speed for all operating conditions.

- NOTE: If the electrical connections to the viscous fan are disconnected the fan will 'idle' and overheating may result. The ECM stores the appropriate fault codes in this case.

ENGINE COOLING SYSTEM OPERATION

Cooling System Coolant Flow



E43045

When the engine is running the coolant pump is driven by the ancillary drive belt. This forces coolant to circulate around the engine and heater, while the thermostat and bypass valve are shut. As the temperature and pressure increases the bypass valve is forced open allowing coolant to circulate through the bypass valve. When the temperature reaches 82°C (180°F) the main thermostat begins to open allowing coolant to circulate through the main radiator. As the thermostat progressively opens (fully open at 95°C (203°F)), the bypass valve progressively closes forcing any coolant through the heater or radiator. Once coolant is allowed to circulate through the radiator, the transmission fluid and the engine oil coolers begin to receive coolant flow.

The increased coolant volume, created by heat expansion, is directed to the expansion tank through a bleed hose from the top of the radiator. The expansion tank has an outlet hose, which is connected into the coolant circuit. This outlet hose returns the coolant to the system when the engine cools.

Coolant flows through the radiator from the top right hand tank to the bottom left hand tank and is cooled by air passing through the matrix. The temperature of the cooling system is monitored by the ECM via the Engine Coolant temperature (ECT) sensor located in the cylinder head. The ECM uses signals from this sensor to control the cooling fan operation and adjust fuelling according to engine temperature.
For additional information, refer to: Electronic Engine Controls (303-14C Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

To control the cooling fan, the ECM sends a Pulse Width Modulated (PWM) signal to the cooling fan module (integral to the ECM). The frequency of the PWM signal is used by the cooling fan module to determine the output voltage supplied to the fan motor.

The ECM varies the duty cycle of the PWM signal between 0 and 100% to vary the fan speed. If the PWM signal is outside the 0 to 100% range, the cooling fan module interprets the signal as an open or short circuit and runs the fans at maximum speed to ensure the engine and gearbox do not overheat.

The ECM operates the fan in response to inputs from the ECT sensor, the transmission oil temperature sensor, the A/C switch and the Air Conditioning (A/C) pressure sensor.
For additional information, refer to: Air Conditioning (412-03A Air Conditioning - V8 S/C 4.2L Petrol, Description and Operation).

The speed of the cooling fan is also influenced by vehicle road speed. The ECM adjusts the speed of the cooling fans, to compensate for the ram effect of vehicle speed, using the Controller Area Network (CAN) road speed signal received from the Anti-lock Braking System (ABS) module.

Diagnosis and Testing

Inspection and verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
● Coolant leaks ● Coolant Hoses ● Coolant expansion tank ● Radiator ● Heater core ● Accessory drive belt ● Viscous fan	● Fuses ● Wiring harness ● Loose or corroded connector(s) ● Engine coolant temperature (ECT) sensor

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification

Symptom chart

Symptom	Possible cause	Action
Coolant loss	● Hoses ● Hose connections ● Radiator ● Water pump ● Heater core ● Gaskets ● Engine casting cracks ● Engine block core plugs	Carry out a visual inspection. If there are no obvious leaks, carry out a pressure test using your workshop tester. Rectify as necessary. Refer ti the relevant section of the workshop manual.
Overheating	● Low/Contaminated coolant ● Thermostat ● Viscous fan ● ECT sensor ● Restricted air flow over the radiator	Check the coolant level and condition. Check the thermostat and rectify as necessary. Carry out a cooling system pressure test. Check the viscous fan operation, make sure the viscous fan rotates freely. Check for obstructions to the air flow over the radiator. Rectify as necessary. Refer to the relevant section of the workshop manual.
Engine not reaching normal temperature	● Thermostat ● Viscous fan	Check the thermostat operation. Check the viscous fan operation, make sure the viscous fan is not seized.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
P011623	Engine Coolant Temperature Sensor 1 Circuit Range/Performance	● Low coolant level ● Engine thermostat failure ● ECT sensor sensing circuit intermittent high resistance ● ECT sensor failure	Check the coolant level and the thermostat operation (stuck open). Refer to the relevant section of the workshop manual. Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P011624	Engine Coolant Temperature Sensor 1 Circuit Range/Performance	● Low coolant level ● Engine coolant thermostat failure ● ECT sensor sensing circuit intermittent high resistance ● ECT sensor failure	Check the coolant level and the thermostat operation (stuck open). Refer to the relevant section of the workshop manual. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011629	Engine Coolant Temperature Sensor 1 Circuit Range/Performance	● Low coolant level ● Engine coolant thermostat failure ● ECT sensor sensing circuit intermittent high resistance ● ECT sensor failure	Check the coolant level and the thermostat operation (stuck open). Refer to the relevant section of the workshop manual. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011700	Engine Coolant Temperature Sensor 1 Circuit Low	● ECT sensor disconnected ● Engine coolant temperature (ECT) sensor sensing circuit high resistance, short circuit to power ● ECT sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011800	Engine Coolant Temperature Sensor 1 Circuit High	● Engine overheat condition/cooling fan failure ● ECT sensor wiring short circuit to ground ● ECT sensor failure	Check the coolant level and the thermostat operation (stuck closed). Check for cooling fan DTCs. Refer to the guided diagnostic routine for this code on the approved diagnostic system.

Engine Cooling - V8 4.4L Petrol - Cooling System Draining, Filling and Bleeding

General Procedures

⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

1. Position the vehicle on a lift.

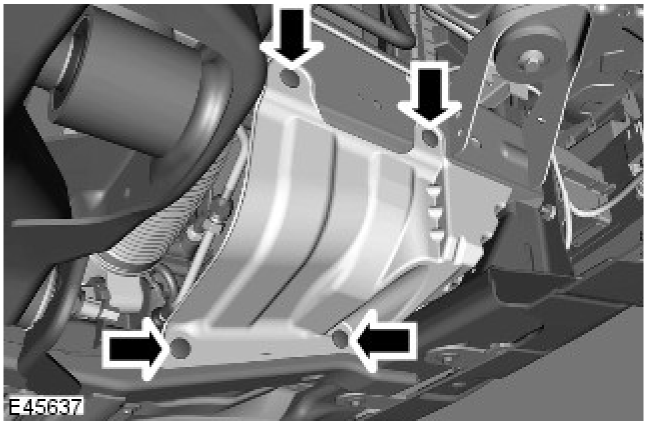
2. Set the heater controls to maximum.

3. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

4. Remove the engine cover.
For additional information, refer to: Engine Cover - V8 4.4L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).

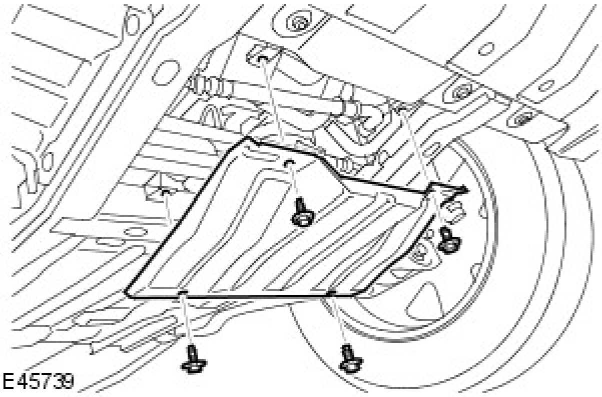
5. ⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

Remove the coolant expansion tank cap.



6. Remove the front LH splash shield.

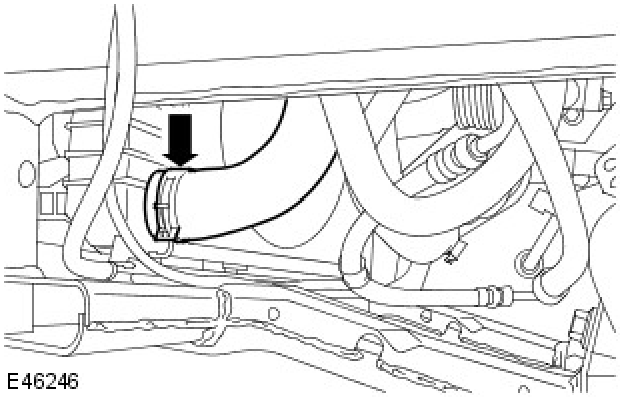
- Remove the 4 clips.



7. Remove the radiator access panel.

- Remove the 4 bolts.

8. Position a container to collect the fluid.



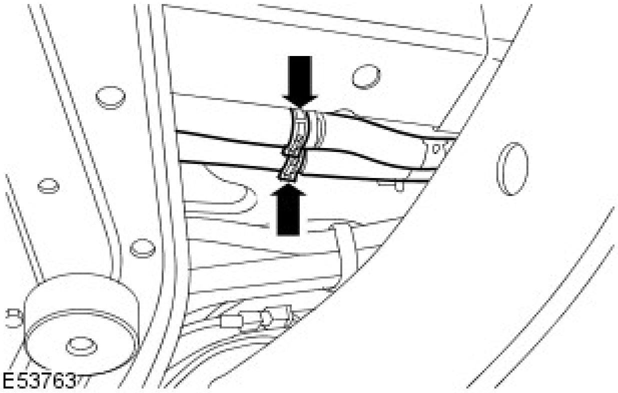
9. ⚠ CAUTION: Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

Release the clip and disconnect the radiator lower hose, allow the coolant to drain.

10. Remove the spare wheel and tire.

- Remove the tool kit.
- Access the winch.

11. Position a container to collect the fluid.



12. Disconnect the rear heater coolant hoses.

- Release the 2 clips.
- Allow the coolant to drain.

13. Connect the rear heater coolant hoses.

- Secure the clips.

14. Install the spare wheel and tire.

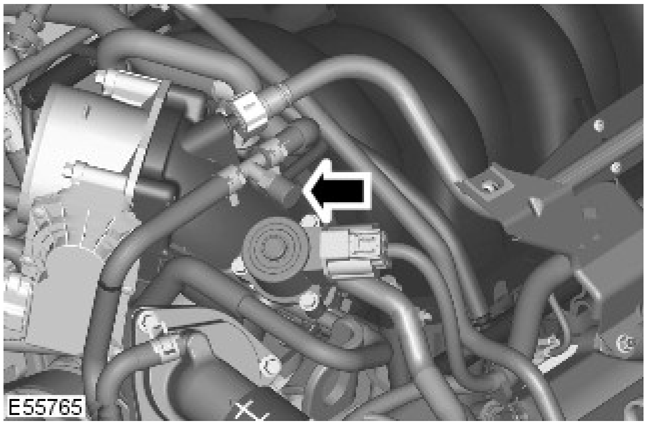
- Stow the tool kit.

15. Connect and secure the radiator lower hose.

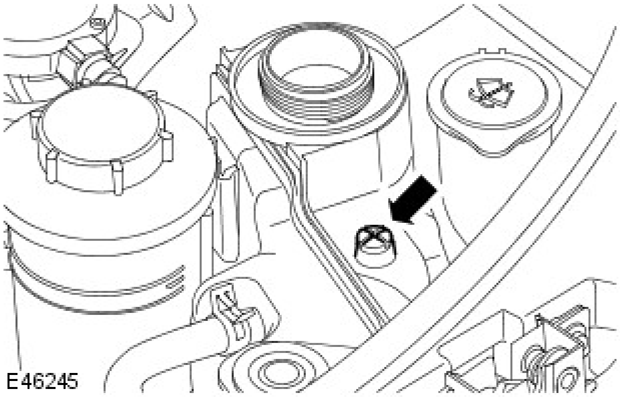
- Secure with the clip.

16. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

17. Connect exhaust extraction hoses to the tail pipes.



18. Loosen the coolant hose bleed screw.



19. Loosen the coolant expansion tank bleed screw.

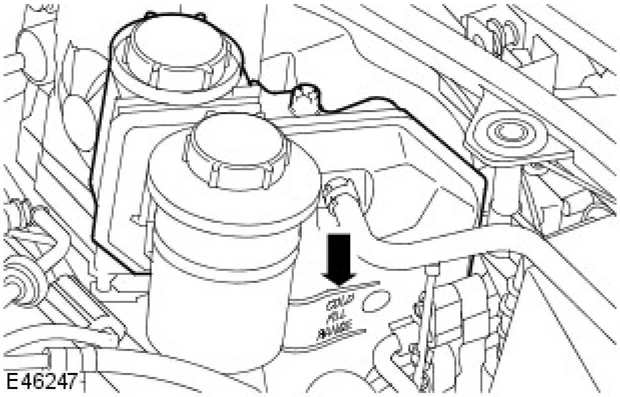
20. Fill the cooling system to the upper level mark of the expansion tank.

21. Start and run the engine.

- Hold the engine speed at 2,500 RPM for 30 seconds.
- Return the engine to idle for 30 seconds.
- Repeat the above procedure a further four times.

22. When a steady stream of coolant is running from the bleed point, close the coolant hose bleed screw.

23. Fill the cooling system, keeping coolant to the upper level mark of the expansion tank until a steady stream of coolant is seen returning to the expansion tank. Tighten the expansion tank bleed screw.



24. NOTE: When the coolant bleed is complete and prior to installing the expansion tank cap, top-up the expansion tank to 30mm above the maximum level.

Install the coolant expansion tank cap.

25. Run the engine until the thermostat opens.

26. Switch the engine off and allow to cool.

27. Install the engine cover.
For additional information, refer to: Engine Cover - V8 4.4L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).

28. Clean any spilt coolant from the vehicle.

29. Install the radiator access panel.

- Tighten the 4 bolts to 10 Nm (7 lb.ft).

30. Install the front LH splash shield.

31. Check and top-up the coolant if required.

Engine Cooling - V8 4.4L Petrol - Cooling System Pressure Test

General Procedures

• NOTE: The following procedure will enable the cooling system to be pressure tested for condition and leaks. Stage 1 will check the expansion tank cap register seal and the cap for leaks. Stage 2 will check the entire cooling system.

• NOTE: It will be necessary to use the cooling system test kit, Part Number LR-218, which is available under the equipment programme.

1. Examine the coolant hoses for signs of cracking, distortion and security of the hose connections.

2. ⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, allow the vehicle cooling system to cool prior to carrying out this procedure.

Disconnect the coolant expansion tank bleed hose.

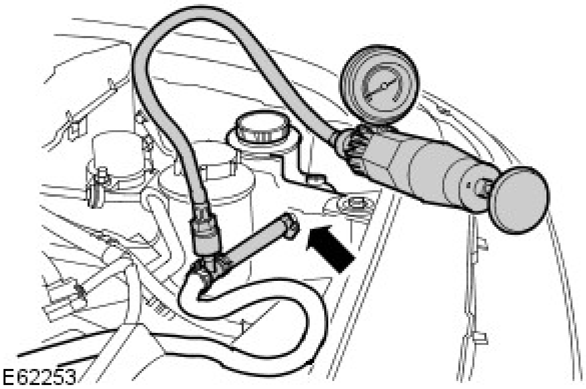
- Release the clip.

3. Install the 'T' piece adaptor (part of the cooling system test kit) between the coolant expansion tank and the coolant bleed hose.

- Secure with the 2 clips.

4. Install the coolant pressure pump assembly.

- Connect to the 'T' piece.



5. Pressurize the cooling system.

- Slowly pressurize the cooling system to 1.0 bar (100 kPa) (14.5 psi).
- Check the pressure remains above 0.9 bar (90 kPa) (13 psi) after waiting for 30 seconds.
- During the pressure drop check, listen for a hissing noise from the expansion tank cap.

6. NOTE: If the coolant expansion tank cap is found to be leaking, replace the cap.

Depressurize the cooling system.

- Disconnect the 'T' piece.
- Connect the coolant expansion tank bleed hose.
- Secure the clip.

7. ⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, allow the vehicle cooling system to cool prior to carrying out this procedure.

Remove the coolant expansion tank cap.

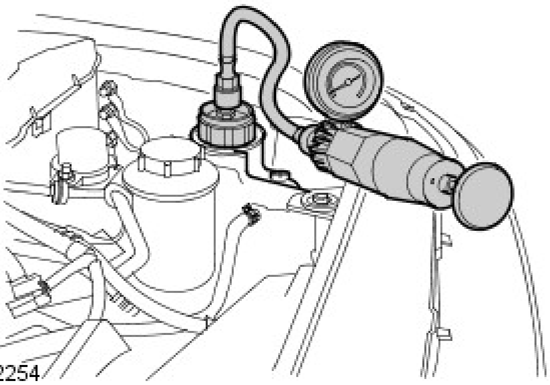
8. NOTE: This adaptor is part of the cooling system test kit.

Install adaptor K83 to the coolant expansion tank.

- Clean the component mating faces.
- Lubricate the seal.

9. Install the coolant pressure pump assembly.

- Slowly pressurize the cooling system to 1.5 bar (150kPa) (22 psi), check the pressure over a 5 minute period. A small pressure decay of approximately 0.15 bar (15 »kPa) (1 psi) over the first minute is normal, as the air in the expansion tank cools.
- If the pressure continues to drop after the initial tolerance, there is a coolant leak.



E62254

10. Depressurize and remove the pressure pump and gauge.

- Install the coolant expansion tank cap.

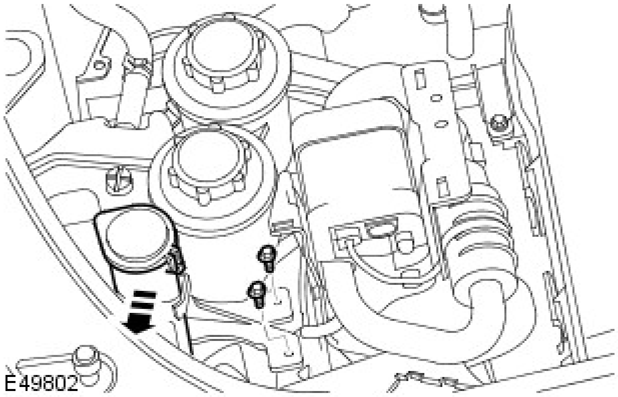
Removal and Installation

Removal

1. Remove the LH headlamp assembly.
For additional information, refer to: Headlamp Assembly (417-01 Exterior Lighting, Removal and Installation).

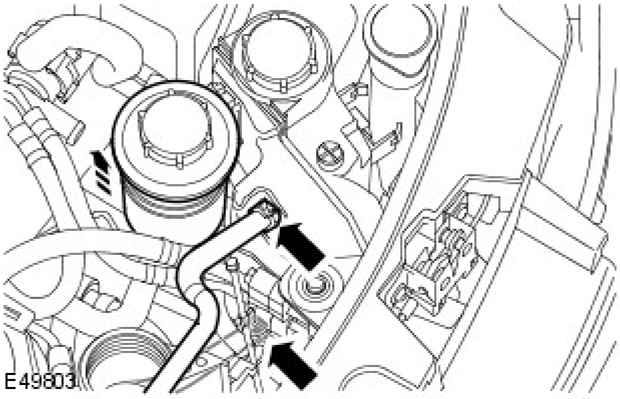
2. Release the windshield washer reservoir filler neck.



3. Release the coolant expansion tank.

- Remove the 2 bolts.

4. Release the power steering fluid reservoir.



5. ⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

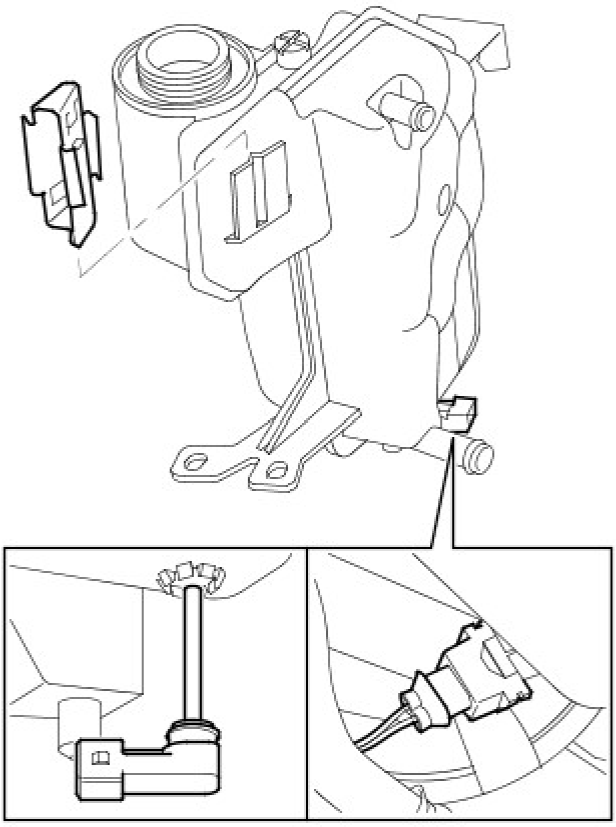
⚠ CAUTION: Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

Disconnect the 2 hoses from the coolant expansion tank.

- Position an absorbent cloth to collect fluid spillage.
- Position a container to collect the fluid.
- Clamp the hoses
- Release the 2 clips.

6. Remove the coolant expansion tank.

- Disconnect the coolant low level sensor electrical connector.



E47510

7. NOTE: Do not disassemble further if the component is removed for access only.

Remove the coolant low level sensor.

- Remove the coolant expansion tank support bracket.

Installation

1. Install the bracket.

2. Install the coolant low level sensor.

3. Install the coolant expansion tank.

- Connect the coolant low level sensor electrical connector.

4. Connect the coolant hoses to the expansion tank.

- Secure with the clips.

5. Top-up the coolant.

- Loosen the coolant expansion tank bleed screw.
- Fill the coolant expansion tank until coolant emerges from the cooling system air bleed screw.
- Remove the hose clamps.
- Tighten the bleed screw to 8 Nm (6 lb.ft).

6. Secure the coolant expansion tank.

- Tighten the bolts to 10 Nm (7 lb.ft).

7. Check and top-up the coolant.

- Install the coolant expansion tank pressure cap.

8. Secure the power steering fluid reservoir.

- Attach to the mounting bracket.

9. Secure the windshield washer reservoir filler neck.

- Locate in clip.

10. Install the LH headlamp assembly.

GENERAL

The cooling system employed is of the pressure relief by-pass type, which allows coolant to circulate around the engine and the heater circuit while the thermostat main valve is closed. The primary function of the cooling system is to maintain the engine within an optimum temperature range under changing ambient and engine operating conditions. Secondary functions are to provide heating for the passenger compartment and cooling for the transmission fluid and engine oil.

The cooling system comprises:

- A radiator
- An intercooler
- A passenger compartment heater matrix
- Two fuel coolers
- Two Exhaust Gas Recirculation (EGR) coolers
- FFBH (Market dependant)
- A coolant pump
- A Pressure Relief Thermostat (PRT)
- An expansion tank
- An electro-viscous fan
- Connecting hoses and pipes.

ENGINE COOLING SYSTEM

The coolant is circulated by a centrifugal type pump mounted on the front of the engine and driven by the ancillary drive 'polyvee' belt. The coolant pump circulates coolant around the cylinder block and cylinder heads via a chamber located in the 'vee' of the engine. Some of the coolant flow is diverted through the integrated fuel and engine oil coolers. Having passed through the engine and oil coolers, the coolant returns to the thermostat housing via the by-pass pipe. Coolant also circulates through the EGR coolers to the heater matrix and returns to the engine side of the PRT.

On vehicles fitted with FFBH, the coolant circulates through the EGR coolers to the FFBH unit (whether active or not) and then on to the heater matrix. The coolant then returns to the engine side of the PRT.

The PRT housing contains a normal thermostat, which is positioned such that the wax's temperature is controlled by both the coolant from the radiator and the bypass. This results in the thermostat being able to vary its opening temperature dependant on ambient conditions. The PRT also contains a sprung loaded valve, which limits the amount flow using the bypass. This means that the engine can run without coolant flowing through the bypass temporarily, to improve heater performance.

The radiator is a cross flow type with an aluminium matrix and has a drain tap on the lower RH rear face. The lower radiator mountings are located part way up the end tanks. The mountings are fitted with rubber bushes, which sit on the upper chassis rails. The radiator upper is mounted by pins, which are pushed through rubber bushes mounted in the Front End Carrier (FEC) above the radiator.

The intercooler is attached to the bottom of the radiator by two pins, which locate into fittings in the radiator end tanks.

The radiator top hose is connected to the PRT by the bypass hose and the bottom hose is directly connected to the outlet side of the thermostat housing.

The expansion tank is fitted forward of the LH suspension turret in the engine compartment. The expansion tank allows for the expansion of the coolant as the engine gets hot and also supplies the engine with coolant as the coolant in the engine contracts. The tank also allows any air trapped in the coolant to be removed.

The liquid cooled transmission fluid cooler (automatic models only) is mounted in the cold side radiator end tank. It is positioned in the middle of the LH end tank.

The 2nd fuel cooler is fed from a sub-cooled section in the cold side end tank of the radiator and returns into the PRT housing on the radiator side.

On vehicles fitted with a FFBH, the unit is located forward of the LH suspension turret. Coolant flows through the FFBH whether it is active or not. The exhaust from the burner is vented into the front LH wheel arch.
For additional information, refer to: Auxiliary Heater (412-02B Auxiliary Heating, Description and Operation).

For additional airflow through the radiator matrix, particularly when the vehicle is stationary, there is an engine driven electro-viscous fan unit fitted to the rear of the radiator. The fan is used for engine cooling and for Air Conditioning (A/C) system cooling. This unit functions as a normal viscous fan, but with electronic control over the level engagement of the clutch. The Engine Control Module (ECM), which determines the required fan speed, controls the level of clutch engagement. The ECM determines engagement based on the coolant, charge air, ambient and transmission oil temperatures and the A/C pressure. The fan is mounted using a left hand thread.

The viscous fan unit is electronically controlled by the ECM to optimise fan speed for all operating conditions.

- NOTE: If the electrical connections to the viscous fan are disconnected the fan will 'idle' and overheating may result. The ECM stores the appropriate fault codes in this case.

When the engine is running the coolant pump is driven by the ancillary drive belt. This forces coolant to circulate around the engine and heater, while the thermostat and bypass valves are shut. As the temperature and pressure increases the bypass valve is forced open allowing coolant to circulate through the bypass valve. When the temperature reaches 82°C (180°F) the main thermostat begins to open, allowing coolant to circulate through the main radiator. As the thermostat progressively opens (fully open at 95°C (203°F)), the bypass valve progressively closes forcing any coolant through the heater or radiator. Once coolant is allowed to circulate through the radiator, the transmission fluid (automatic models only) and fuel coolers begin to receive coolant flow.

The increased coolant volume, created by heat expansion, is directed to the expansion tank through a bleed hose from the top of the radiator. The expansion tank has an outlet hose, which is connected into the coolant circuit. This outlet hose returns the coolant to the system when the engine cools.

Coolant flows through the radiator from the top right hand tank to the bottom left hand tank and is cooled by air passing through the matrix. The temperature of the cooling system is monitored by the ECM via the Engine Coolant temperature (ECT) sensor located in the cylinder head. The ECM uses signals from this sensor to control the cooling fan operation and adjust fuelling according to engine temperature.
For additional information, refer to: Electronic Engine Controls (303-14C Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

To control the cooling fan, the ECM sends a Pulse Width Modulated (PWM) signal to the cooling fan module (integral to the ECM).

The frequency of the PWM signal is used by the cooling fan module to determine the output voltage supplied to the fan motor.

The ECM varies the duty cycle of the PWM signal between 0 and 100% to vary the fan speed. If the PWM signal is outside the 0 to 100% range, the cooling fan module interprets the signal as an open or short circuit and runs the fans at maximum speed to ensure the engine and gearbox do not overheat.

The ECM operates the fan in response to inputs from the ECT sensor, the transmission oil temperature sensor, the charge air temperature sensor, the A/C switch and the A/C pressure sensor.
For additional information, refer to: Air Conditioning (412-03A Air Conditioning - V8 S/C 4.2L Petrol, Description and Operation).

The speed of the cooling fan is also influenced by vehicle road speed. The ECM adjusts the speed of the cooling fans, to compensate for the ram effect of vehicle speed, using the Controller Area Network (CAN) road speed signal received from the Anti-lock Braking System (ABS) module.

Pressure Relief Thermostat (PRT)

The thermostat is exposed to 85% hot coolant from the engine on one side and 15% cold coolant returning from the radiator bottom hose on the other. This allows the thermostat to react to the ambient conditions and provide coolant control for both winter and summer use. Hot coolant from the engine passes via holes in the by-pass flow valve into a tube which surrounds 85% of the thermostat sensitive area. Cold coolant from the radiator conducts through the remaining 15% of the sensitive area. In cold ambient conditions, the engine temperature is raised by approximately 10°C (50°F) to compensate for the heat loss of 15% exposure to the cold coolant returning from the bottom hose. This improves heater performance and engine warm-up.

The by-pass flow valve is held closed by a light spring and operates to further assists engine and heater warm-up. When the main valve is closed and the engine speed is at idle, the coolant pump does not produce sufficient flow and pressure to overcome the spring and open the valve. In this condition the valve prevents coolant circulating through the by-pass circuit and directs coolant through the heater matrix only. This provides a higher flow of coolant through the heater matrix improving passenger comfort in cold conditions.

When the engine speed increases above idle, the coolant pump produces a greater flow and pressure than the heater circuit can accommodate. The build up of pressure acts on the flow valve, overcoming the spring pressure, opening the valve and relieving the pressure in the heater circuit. The valve then modulates to provide maximum coolant flow through the heater matrix and allowing excess coolant to flow into the by-pass circuit to provide the engine's cooling requirements at higher engine speeds. The thermostat then regulates the flow through the radiator to maintain the engine at the optimum temperature. Maximum opening of the thermostat, and therefore maximum flow through the radiator, occurs if the coolant temperature reaches 95°C (203°F).

Diagnosis and Testing

Inspection and verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
Coolant leaks Coolant Hoses Coolant expansion tank Radiator Heater core Accessory drive belt Viscous fan	Fuses Harnesses Loose or corroded connector(s) Engine coolant temperature (ECT) sensor

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification

Symptom chart

Symptom	Possible cause	Action
Coolant loss	Hoses Hose connections Radiator Water pump Heater core Gaskets Engine casting cracks Engine block core plugs	Carry out a visual inspection. If there are no obvious leaks, carry out a pressure test using your workshop tester. Rectify as necessary. Refer to the relevant section of the workshop manual.
Overheating	Low/Contaminated coolant Thermostat Viscous fan ECT sensor Restricted air flow over the radiator	Check the coolant level and condition. Check the thermostat and rectify as necessary. Carry out a cooling system pressure test. Refer to the relevant section of the workshop manual. Check the viscous fan operation, make sure the viscous fan rotates freely. Check for obstructions to the air flow over the radiator.
Engine not reaching normal temperature	Thermostat Viscous fan Thermostat Electric fan Fan speed module	Check the thermostat operation. Check the viscous fan operation, make sure the viscous fan is not seized.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

Engine Cooling - TDV6 2.7L Diesel - Cooling System Draining, Filling and Bleeding

General Procedures

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Set the heater controls to maximum.

3. Disconnect the battery ground cable.

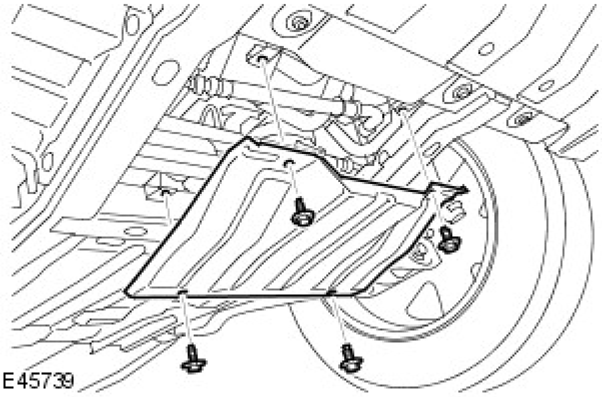
4. Remove the engine cover.
For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

5. WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

Remove the coolant expansion tank cap.

6. Remove the radiator access panel.

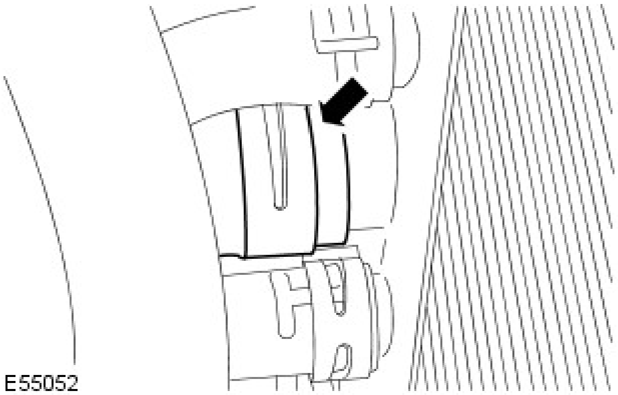
- Remove the 4 bolts.



7. Position a container to collect the fluid.

8. CAUTION: Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

Release the clip and disconnect the radiator lower coolant hose, allow the coolant to drain.



9. Remove the container.

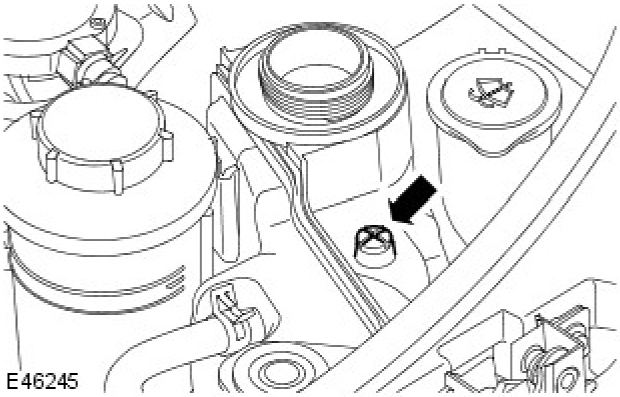
10. Connect and secure the radiator lower coolant hose.

- Secure with the clip.

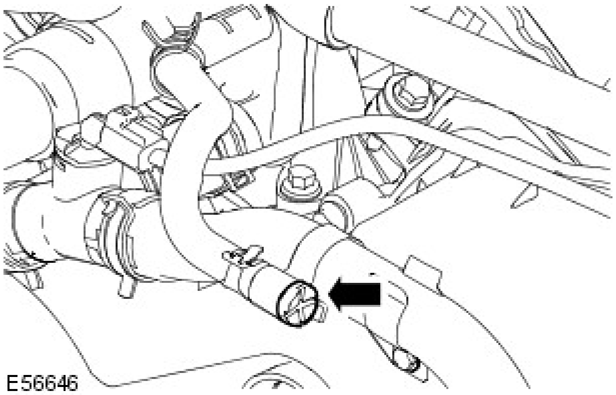
11. Connect the battery ground cable.

12. Connect exhaust extraction hoses to the tail pipes.

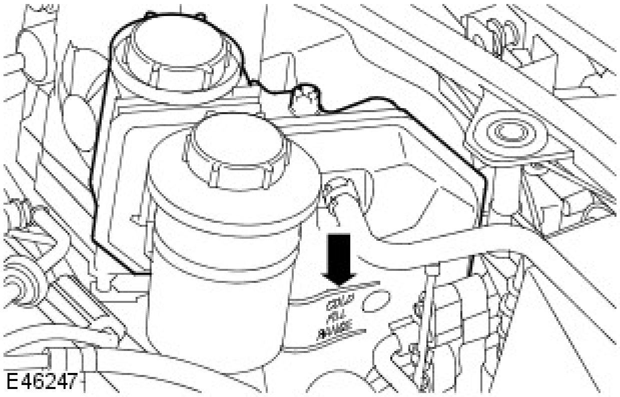
13. Loosen the coolant expansion tank bleed screw.



14. Loosen the cylinder head bleed hose bleed screw.



15. Fill the cooling system, keeping coolant to the upper level mark of the expansion tank.



16. Tighten the bleed screws.

17. Install the coolant expansion tank cap.

18. Start and run the engine.

- Hold the engine speed at 3,000 RPM for one minute.
- Return the engine to idle for five minutes.
- Hold the engine speed at 3,000 RPM for one minute.
- Run the engine until the thermostat opens.

19. WARNING: Release the cooling system pressure by slowly turning the coolant expansion tank cap a quarter of a turn. Cover the expansion tank cap with a thick cloth to prevent the possibility of scalding. Failure to follow this instruction may result in personal injury.

• NOTE: When the coolant bleed is complete and prior to installing the expansion tank cap, top-up the expansion tank to 30mm above the maximum level.

Switch the engine off.

- Remove the coolant expansion cap, allow the level to settle and top-up so that the level is 30mm above the upper level.
- Allow the engine to cool.

20. Install the engine cover.
For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

21. Clean any spilt coolant from the vehicle.

22. Install the radiator access panel.

- Tighten the 4 bolts to 10 Nm (7 lb.ft).

23. Check and top-up the coolant if required.

Engine Cooling - TDV6 2.7L Diesel - Cooling System Pressure Test

General Procedures

• NOTE: The following procedure will enable the cooling system to be pressure tested for condition and leaks. Stage 1 will check the expansion tank cap register seal and the cap for leaks. Stage 2 will check the entire cooling system.

• NOTE: It will be necessary to use the cooling system test kit, Part Number LR-218, which is available under the equipment programme.

1. Examine the coolant hoses for signs of cracking, distortion and security of the hose connections.

2. ⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, allow the vehicle cooling system to cool prior to carrying out this procedure.

Disconnect the coolant expansion tank bleed hose.

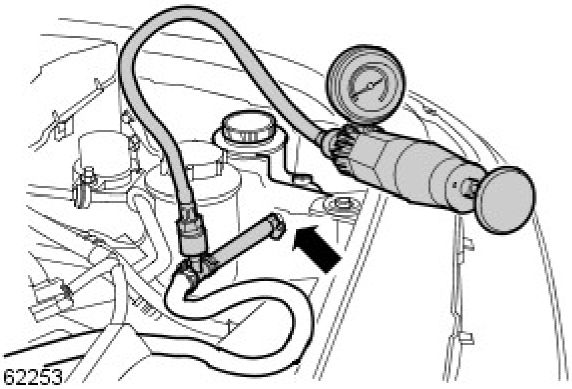
- Release the clip.

3. Install the 'T' piece adaptor (part of the cooling system test kit) between the coolant expansion tank and the coolant bleed hose.

- Secure with the 2 clips.

4. Install the coolant pressure pump assembly.

- Connect to the 'T' piece.



E62253

5. Pressurize the cooling system.

- Slowly pressurize the cooling system to 1.0 bar (100 kPa) (14.5 psi).
- Check the pressure remains above 0.9 bar (90 kPa) (13 psi) after waiting for 30 seconds.
- During the pressure drop check, listen for a hissing noise from the expansion tank cap.

6. NOTE: If the coolant expansion tank cap is found to be leaking, replace the cap.

Depressurize the cooling system.

- Disconnect the 'T' piece.
- Connect the coolant expansion tank bleed hose.
- Secure the clip.

7. ⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, allow the vehicle cooling system to cool prior to carrying out this procedure.

Remove the coolant expansion tank cap.

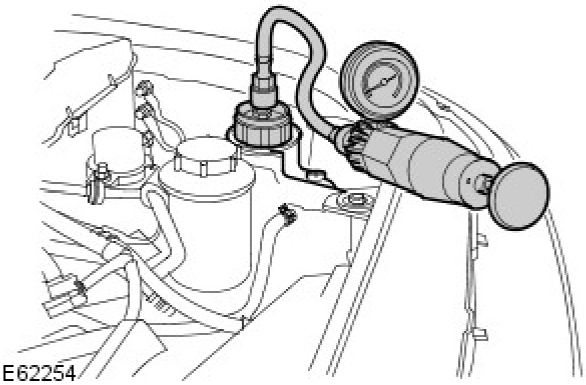
8. NOTE: This adaptor is part of the cooling system test kit.

Install adaptor K83 to the coolant expansion tank.

- Clean the component mating faces.
- Lubricate the seal.

9. Install the coolant pressure pump assembly.

- Slowly pressurize the cooling system to 1.5 bar (150kPa) (22 psi), check the pressure over a 5 minute period. A small pressure decay of approximately 0.15 bar (15 »kPa) (1 psi) over the first minute is normal, as the air in the expansion tank cools.
- If the pressure continues to drop after the initial tolerance, there is a coolant leak.



10. Depressurize and remove the pressure pump and gauge.

- Install the coolant expansion tank cap.

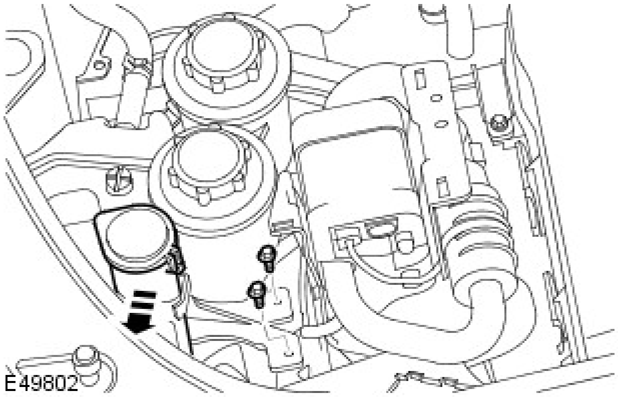
2. Release the windshield washer reservoir filler neck.

3. Release the coolant expansion tank.

- Remove the 2 bolts.



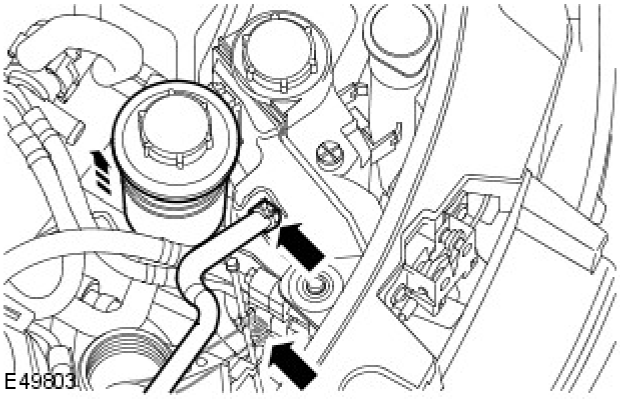
4. Release the power steering fluid reservoir.

5. ⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

⚠ CAUTION: Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

Disconnect the 2 hoses from the coolant expansion tank.

- Position an absorbent cloth to collect fluid spillage.
- Position a container to collect the fluid.
- Clamp the hoses
- Release the 2 clips.



6. Remove the coolant expansion tank.

- Disconnect the coolant low level sensor electrical connector.

Remove the coolant low level sensor.

- Remove the coolant expansion tank support bracket.

Installation

1. Install the bracket.

2. Install the coolant low level sensor.

3. Install the coolant expansion tank.

- Connect the coolant low level sensor electrical connector.

4. Connect the coolant hoses to the expansion tank.

- Secure with the clips.

5. Top-up the coolant.

- Loosen the coolant expansion tank bleed screw.
- Fill the coolant expansion tank until coolant emerges from the cooling system air bleed screw.
- Remove the hose clamps.
- Tighten the bleed screw to 8 Nm (6 lb.ft).

6. Secure the coolant expansion tank.

- Tighten the bolts to 10 Nm (7 lb.ft).

7. Check and top-up the coolant.

- Install the coolant expansion tank pressure cap.

8. Secure the power steering fluid reservoir.

- Attach to the mounting bracket.

9. Secure the windshield washer reservoir filler neck.

Engine Cooling - TDV6 2.7L Diesel - Cooling System Draining and Vacuum Filling

General Procedures

1. ⚠ WARNING: To avoid having scalding hot coolant or steam blowing out of the cooling system, use extreme care when removing the coolant pressure cap from a hot cooling system. Wait until the engine has cooled, then wrap a thick cloth around the coolant pressure cap and turn it slowly until the pressure begins to release. Step back while the pressure is released from the system. When certain all the pressure has been released (still with a cloth) turn and remove the coolant pressure cap from the coolant expansion tank. Failure to follow these instructions may result in personal injury.

- CAUTIONS:

⚠ The engine cooling system must be maintained with the correct concentration and type of anti-freeze solution to prevent corrosion and frost damage. Failure to follow this instruction may result in damage to the vehicle.

⚠ Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

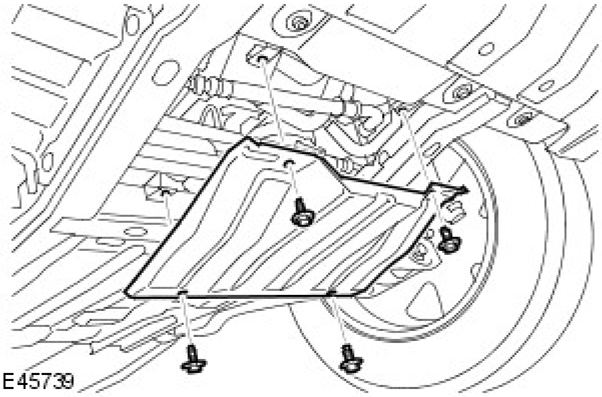
Set the heater controls to maximum HOT.

2. ⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

Remove the coolant expansion tank cap.

3. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

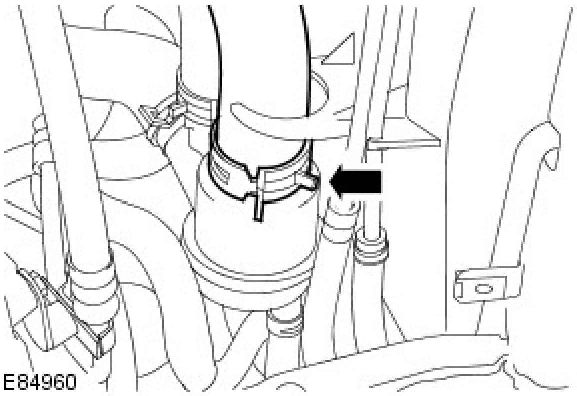
Raise and support the vehicle.



4. Remove the radiator access panel.

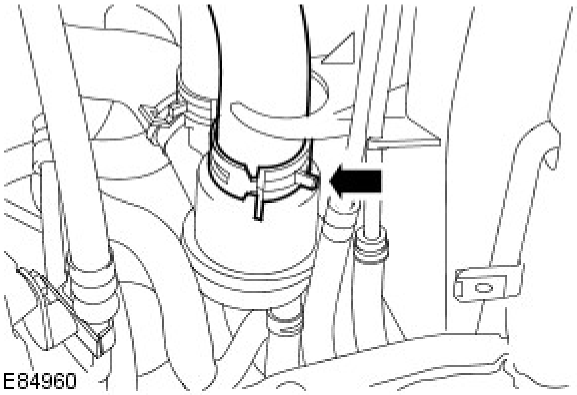
- Remove the 4 bolts.

5. Position a container to collect the fluid.



6. Disconnect the coolant hose from the thermostat.

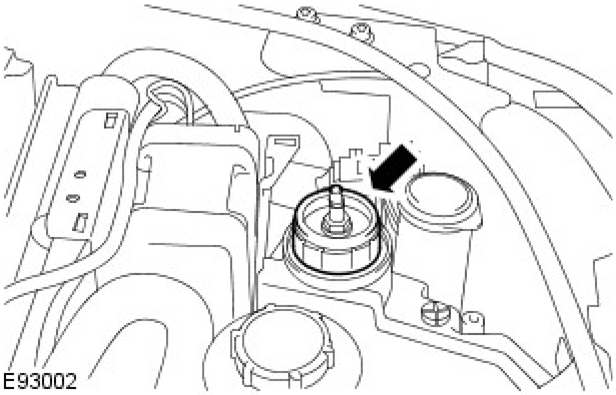
- Release the clip.
- Allow the coolant to drain.



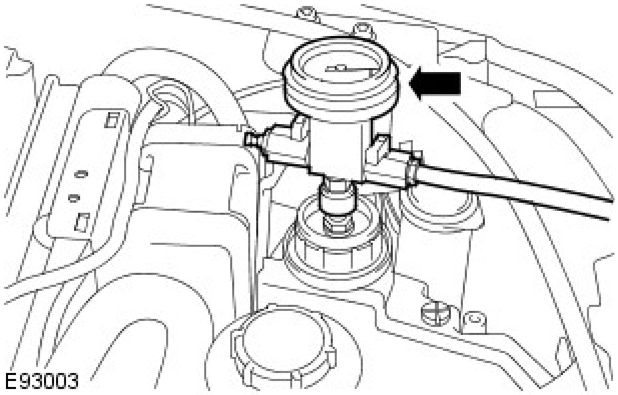
7. Connect the coolant hose to the thermostat.

- Secure the clip.
- Remove the container.

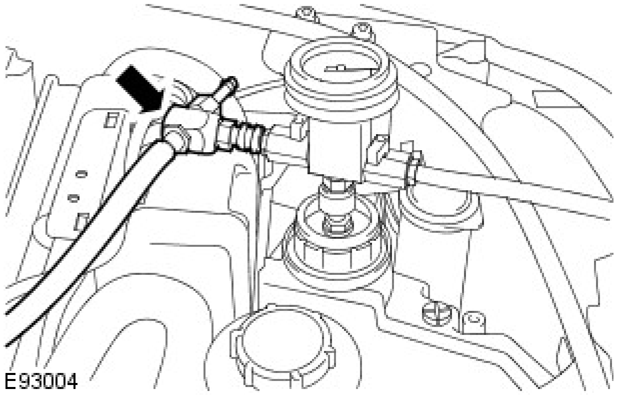
8. Prepare a sufficient amount of coolant to the specified concentration.



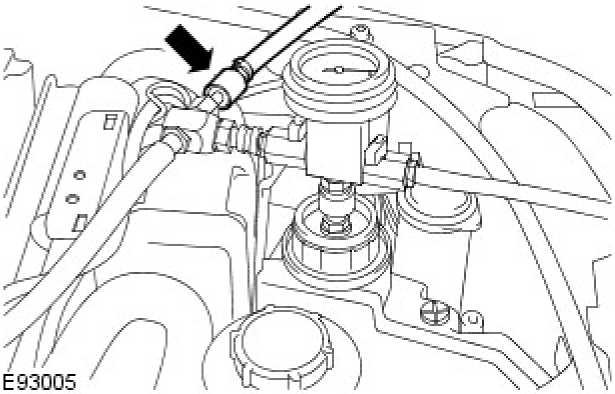
9. Install the cooling system vacuum refill adaptor to the expansion tank.



10. Install the vacuum filler gauge to the cooling system vacuum refill adaptor.



11. Install the venturi tube assembly to the vacuum filler gauge.



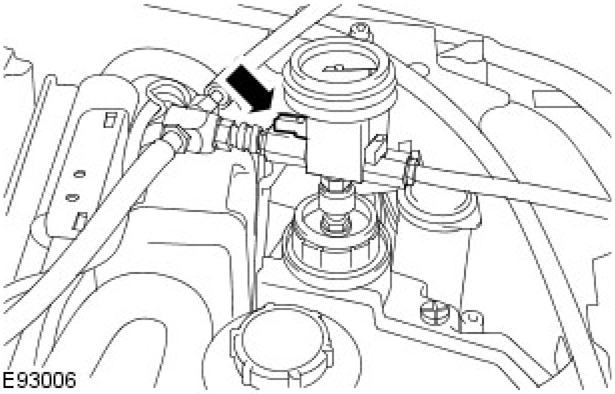
12. NOTE: Make sure both valves on gauge assembly are in the closed position.

Connect a regulated compressed air supply to the venturi tube assembly.

13. NOTE: Make sure air cannot enter the hose.

Position the coolant pick-up pipe into a container of clean coolant.

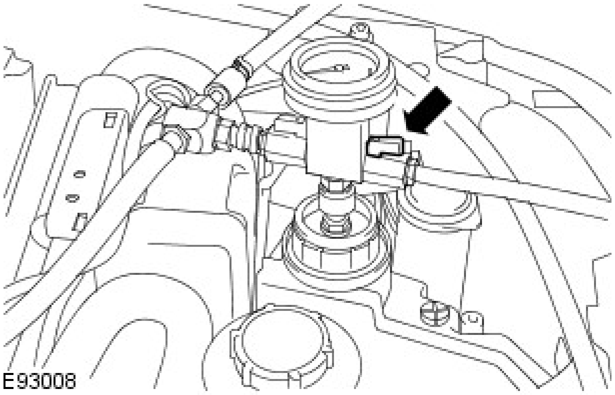
14. Position the evacuated air hose into a container.



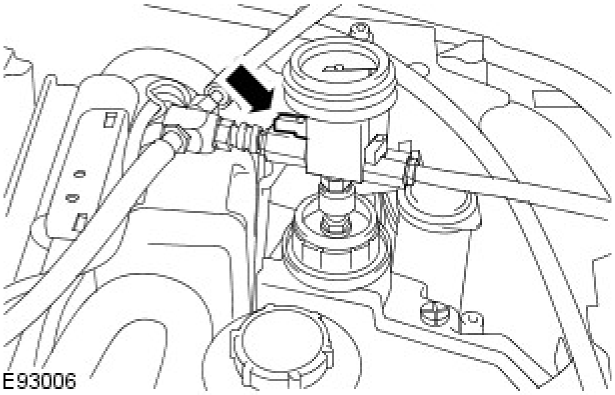
15. NOTE: Make sure the coolant supply valve is in the closed position on the vacuum filler gauge assembly.

- NOTE: Small diameter or long airlines may restrict airflow to the coolant vacuum fill tool.
- NOTE: The coolant vacuum fill tool needs an air pressure of 6 to 8 bar (87 to 116 psi) to operate correctly.

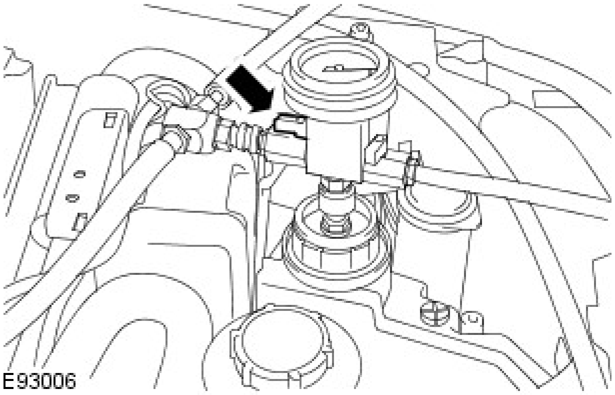
Open the air supply valve.



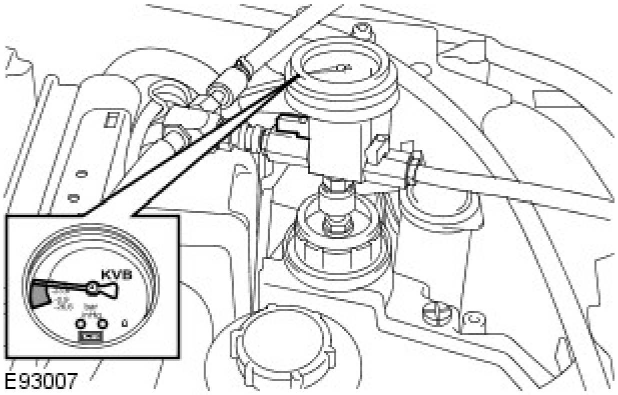
16. Open the coolant supply valve for 2 seconds to prime the coolant supply hose.



17. Apply air pressure progressively until the arrow on the vacuum filler gauge reaches the green segment.

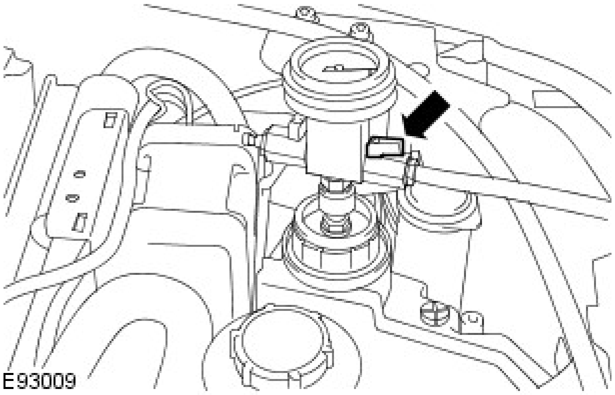


18. Close the air supply valve.



19. Allow one minute to check the vacuum is held.

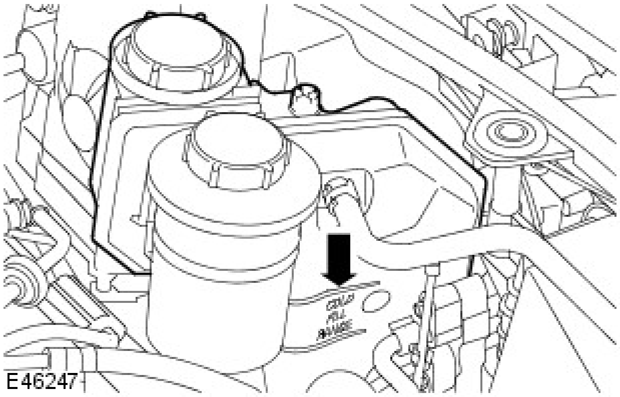
- Disconnect the compressed air supply.



20. NOTE: Close the coolant supply valve when the coolant expansion tank MAX mark is reached or coolant movement has ceased.

Open the coolant supply valve and allow the coolant to be drawn into the system.

21. Remove the vacuum filler gauge and cooling system vacuum refill adaptor assembly.



22. Check and top-up the coolant if required.

23. Install the coolant expansion tank cap.

24. CAUTION: Observe the engine temperature gauge. If the engine starts to over-heat switch off immediately and allow to cool. Failure to follow this instruction may cause damage to the vehicle.

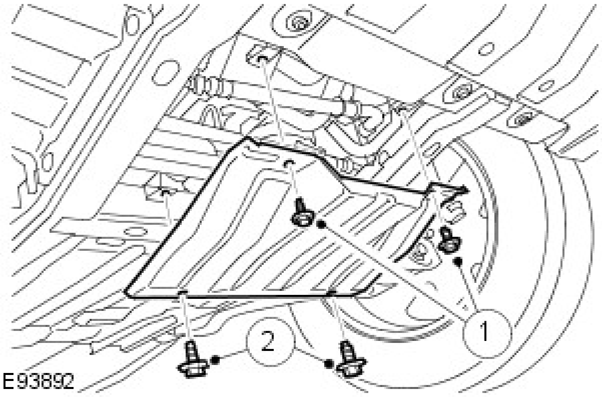
Start and run the engine.

- Hold the engine speed at 3,000 RPM for one minute.
- Return the engine to idle for five minutes.
- Hold the engine speed at 3,000 RPM for one minute.
- Run the engine until the thermostat opens.

25. Switch the engine off and allow to cool.

26. Clean any spilt coolant from the vehicle.

27. Install the radiator access panel.



1. Tighten the bolts to 10 Nm (7 lb.ft).
2. Tighten the bolts to 62 Nm (46 lb.ft).

28. Check for leaks and then fill the coolant expansion tank to the MAX mark.

OVERVIEW

The pressurized cooling system employed allows coolant to circulate around the engine and the heater circuit while the thermostat main valve is closed. The primary function of the cooling system is to maintain the engine within an optimum temperature range under changing ambient and engine operating conditions. Secondary functions are to provide:

- optimized cabin heating during the engine warm-up phase
- full automatic transmission fluid temperature control (including heating)
- low temperature fuel cooling via a dedicated low temperature sub-cooler
- Enhanced Exhaust Gas Recirculation (EGR) cooling via supply of low temperature coolant from the radiator outlet

During the initial engine warm-up, when the main thermostat is closed, warm coolant is directed to the ancillary heat exchangers:

- Cabin heater
- Engine oil heat exchanger
- Automatic transmission fluid heat exchanger (limited flow at low engine speeds)

The main engine thermostat is of a pressure relief design. The prime function of this thermostat is to use the heater and ancillary circuit as the only radiator by-pass while the thermostat is closed.

The pressure relief thermostat gradually opens the main radiator by-pass circuit at engine speeds above 1500rpm. This system ensures that the maximum available coolant flow is directed to the heater and ancillary heat exchangers during warm-up without affecting the durability of the engine. By using this type of thermostat there is enough heater flow for all conditions without the need for a dedicated electric water pump.

ENGINE COOLING SYSTEM

The coolant is circulated at up to 400 liters per minute by a coolant pump mounted on the front of the engine and driven by an ancillary drive 'polyvee' belt. The coolant pump circulates coolant through the cylinder block and cylinder heads via a chamber located in the 'vee' of the engine. Having passed through the engine the coolant returns to the thermostat housing. The coolant then progresses down the 'top hose' to the heater pipe. The heater pipes lead to the bulkhead and return to the engine side of the thermostat.

The engine contains a conventional wax thermostat, which is positioned such that the wax's temperature is controlled by the bypass coolant. The thermostat housing also contains a sprung loaded valve, which limits the amount of coolant using the bypass. At low engine speeds most coolant is diverted through the heater. At higher engine speeds the bypass opens to protect the heater matrix from to higher pressures and flow rates. This means the engine can run with minimal coolant flowing through the bypass at low engine speeds, to improve heater performance.

The radiator is a vertical flow-type with an aluminium matrix and has a drain tap on the bottom left-hand rear face. The lower radiator mountings are located part way up the module frame. The mountings are fitted with rubber bushes, which sit on plastic mounts clipped into the chassis rails. The top of the radiator is located in rubber bushes secured by brackets fitted to the bonnet locking platform.

The coolant degas tank is fitted behind the Left Hand (LH) side headlight of the LH in the engine compartment. The tank allows for system filling and any air trapped in the coolant to be removed.

The liquid cooled transmission oil cooler is mounted to the fan cowl. It is fed coolant from the sub-cooled section of the radiator, which is controlled by the oil cooler mixer valve.

The oil cooler mixer valve is a 2 stage valve, which controls the heating and cooling of the transmission oil. The operation of the first stage is to warm up oil from cold to improve emissions and driveability. The second stage is fully operational once the coolant temperature reaches 91°C (196°F) and allows cooling of the oil (starts to open at 84°C (183°F)).

For additional airflow through the radiator matrix, particularly when the vehicle is stationary or slow moving, there is an engine driven electro-viscous unit. This unit functions as a normal viscous fan, but with electronic control over the level of engagement of the viscous clutch. The Engine Control Module (ECM), which determines the required fan speed, controls the level of clutch engagement. The ECM determines engagement based on the coolant, ambient and transmission oil temperatures and Air Conditioning (AC) system pressure. The fan is mounted using a Left Hand (LH) thread.

The viscous fan unit is electronically controlled by the ECM to optimise fan speed for all operating conditions.

• NOTE: If the electrical connections to the viscous fan are disconnected the fan will 'idle' and overheating may result. The ECM stores the appropriate fault codes in this case. A 'check engine light' will also be displayed in the instrument cluster.

Due to package constraints an auxiliary radiator is required to maintain acceptable coolant temperatures under arduous driving conditions such as high-load and high ambient temperatures. This radiator is located in the in the RH wheel arch area, with cooling airflow supplied by a dedicated aperture in the front bumper. The auxiliary radiator is connected in parallel with the main radiator, with the coolant flow being controlled by the main engine thermostat.

An air to air intercooler is located behind the AC condenser, but in front of the main radiator. This reduces the charge air temperature (post turbocharger compressor) by up to 130°C (266°F) before entering the engine. The intercooler has 2 separate air paths for the LH and RH cylinder banks.

After the initial warm-up phase is complete (coolant temperature between 40°C (104°F) and 70°C (158°F), depending on ambient temperature), the EGR mixer valve begins to blend cold water from the radiator outlet. This has the effect of reducing the temperature of the coolant supplied by to the EGR coolers, thus improving their effectiveness and reducing the emissions of Nitrogen Oxides (NOx). The flow rate of this coolant is controlled by a thermostatic valve located in each EGR cooler exit and ensures that maximum EGR cooling is delivered without compromising engine warm-up or cabin heater performance.

As the temperature and pressure increases the bypass valve is forced open allowing coolant to circulate through the bypass valve. When the temperature reaches 88°C (190°F) the main engine thermostat and transmission oil cooler mixer thermostat begin to open allowing coolant to circulate through the main radiator. As the thermostat progressively opens (fully open at 95°C (203°F)), the bypass valve progressively closes forcing any coolant through the heater or radiator.

Coolant flows through the radiator from the top RH tank to the bottom LH tank and is cooled by air passing through the matrix. A small flow of coolant from the radiator and the top of the engine is directed to the degas tank where any trapped air is separated.

In arduous driving conditions such as towing and/or in high ambient temperatures the radiator sub-cooled section and dedicated fuel sub-cooler radiator supply low temperature coolant to the oil/fuel coolers. This enables sufficient heat exchange into the coolant from these systems to maintain the fluid temperatures within their required limits.

The temperature of the cooling system is monitored by the ECM via the Engine Coolant temperature (ECT) sensor located in the coolant housing. The ECM uses signals from this sensor to control the cooling fan operation.

Regulation of the coolant temperature is achieved via engagement of the electro-viscous fan assembly. This is controlled by a Pulse Width Modulated (PWM) signal with a duty cycle of between 0 and 100%, provided by the ECM and derived from inputs based on:

- Coolant temperature
- Ambient air temperature
- Engine inlet air temperature
- Air Conditioning (AC) system pressure
- AC switch operation
- Transmission oil temperature

Fan speed control is variable; however, because the fan is driven directly from the engine, the maximum fan speed available is tied to engine speed. At high engine speeds the fan is progressively disengaged to protect the clutch unit. This system provides very high levels of fan power, up to 5 kilo Watts (kW), with enhanced noise and fuel economy benefits compared to mechanically controlled viscous fans.

The speed of the cooling fan is also influenced by vehicle road speed. The ECM adjusts the speed of the cooling fans, to compensate for the ram effect of vehicle speed, using the Controller Area Network (CAN) road speed signal received from the Anti-lock Braking System (ABS) module.

Diagnosis and Testing

Inspection and verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
● Coolant leaks ● Coolant Hoses ● Coolant expansion tank ● Radiator ● Heater core ● Accessory drive belt ● Viscous fan	● Fuses - Fuse 7E, engine compartment ● Harnesses ● Loose or corroded connector(s) ● Engine coolant temperature (ECT) sensor ● Engine oil temperature (EOT) sensor ● Viscous fan solenoid ● Environmental box (E-Box) fan

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom chart

Symptom	Possible cause	Action
Coolant loss	● Hoses ● Hose connections ● Radiator ● Water pump ● Heater core ● Gaskets ● Engine casting cracks ● Engine block core plugs	Carry out a visual inspection. If there are no obvious leaks, carry out a pressure test using your workshop tester. Rectify as necessary.
Overheating	● Low/Contaminated coolant ● Thermostat ● Viscous fan ● Engine coolant temperature (ECT) sensor ● Restricted air flow over the radiator	Check the coolant level and condition. Carry out a pressure test using your workshop tester. Rectify as necessary. Check the thermostat and rectify as necessary. Check the viscous fan operation, make sure the viscous fan rotates freely. Check for obstructions to the air flow over the radiator. Rectify as necessary.
Engine not reaching normal temperature	● Thermostat ● Viscous fan ● Thermostat ● Electric fan ● Fan speed module	Check the thermostat operation. Check the viscous fan operation, make sure the viscous fan is not seized. Rectify as necessary.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
P011626	Engine coolant temperature (ECT) sensor circuit range/performance - signal rate of change below threshold	● ECT sensor circuit: intermittent high resistance ● ECT sensor fault	Check the ECT sensor and circuits. Refer to the electrical guides. With the engine cold, read the coolant temperature sensor using a datalogger function and start the engine. Record the value and allow the engine to idle for 20 minutes. After 20 minutes, recheck the value. If the value has not increased by more than 10 °C, install a new sensor. REFER to: Engine Coolant Temperature (ECT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P011716	Engine coolant temperature (ECT) sensor circuit low input - voltage below threshold	● ECT sensor circuit: short circuit to ground ● ECT sensor fault	Check the ECT sensor and circuits. Refer to the electrical guides. Measure the resistance of the sensor. Nominal resistance at 20 °C (68 °F) should be between 35.47 and 39.21 Kohms. If the resistance is outside this range, install a new sensor. REFER to: Engine Coolant Temperature (ECT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P011817	Engine coolant temperature (ECT) sensor circuit high input - voltage above threshold	● ECT sensor circuit: short circuit to power ● ECT sensor fault	Check the ECT sensor and circuits. Refer to the electrical guides. Measure the resistance of the sensor. Nominal resistance at 20 °C (68 °F) should be between 35.47 and 39.21 Kohms. If the resistance is outside this range, install a new sensor. REFER to: Engine Coolant Temperature (ECT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Engine Cooling - TDV8 3.6L Diesel - Cooling System Partial Draining, Filling and Bleeding

General Procedures

⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

- CAUTIONS:

⚠ The engine cooling system must be maintained with the correct concentration and type of anti-freeze solution to prevent corrosion and frost damage. Failure to follow this instruction may result in damage to the engine

⚠ Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

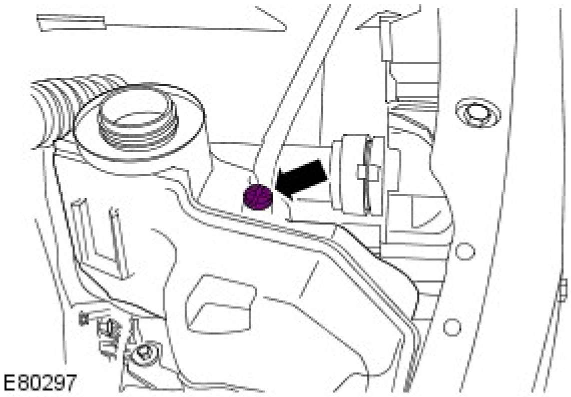
2. Set the heater controls to HOT.

3. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

4. ⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

Remove the coolant expansion tank cap.

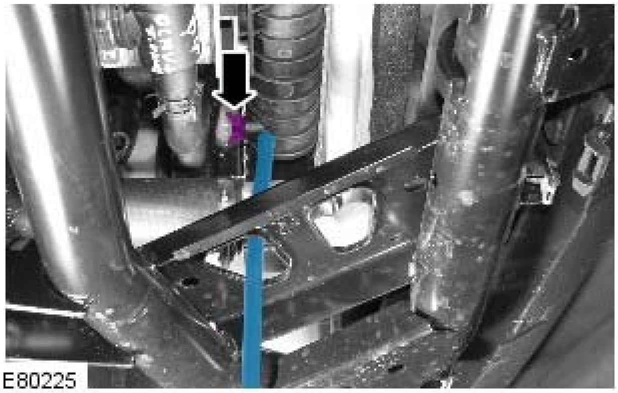
5. Loosen the coolant expansion tank bleed screw.



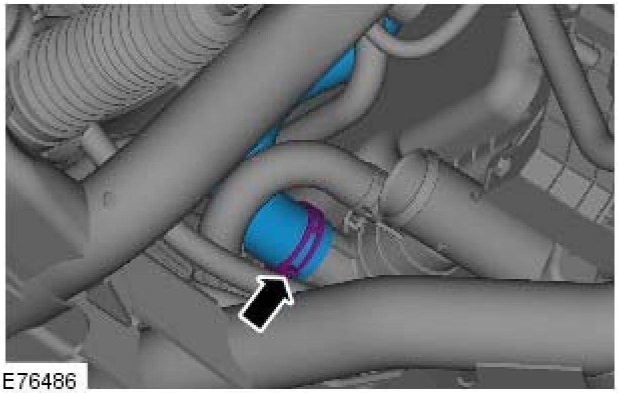
6. Remove the radiator splash shield.
For additional information, refer to: Radiator Splash Shield (501-02, Removal and Installation).

7. Drain the coolant from the radiator.

- Position a container to collect the fluid.
- Attach a hose to the radiator drain tap. Open the tap.



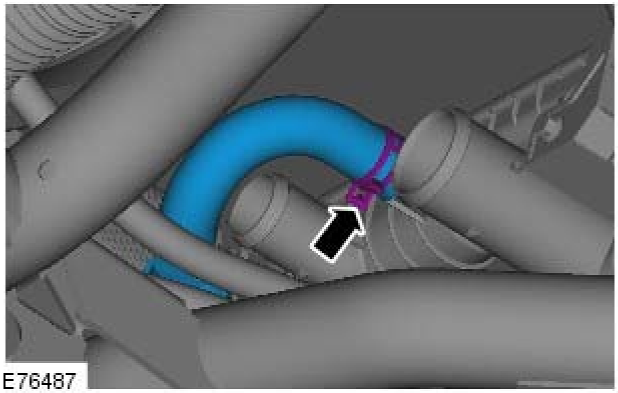
8. Close the radiator drain tap and remove the hose.



9. ⚠ WARNING: Eye protection must be worn.

Disconnect the radiator lower hose from the radiator.

- Release the clip.
- Allow the coolant to drain.



10. ⚠ WARNING: Eye protection must be worn.

Disconnect the oil cooler multi valve hose from the radiator.

- Allow the coolant to drain.

11. ⚠ WARNING: Eye protection must be worn.

Disconnect the coolant feed hose from the transmission fluid cooler.

- Allow the coolant to drain.

12. Connect the coolant hoses.

- Remove the container.

13. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

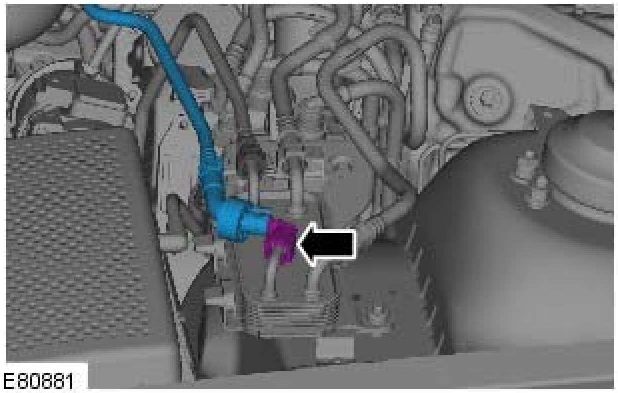
14. Connect exhaust extraction hoses to the tail pipes.

15. ⚠ CAUTION: Anti-freeze concentration must be maintained at 50%.

Fill the cooling system expansion tank until the coolant level becomes static with in the "COLD FILL RANGE".

16. ⚠ CAUTION: Make sure the coolant level remains above the "COLD FILL RANGE" lower level mark.

Start the engine and allow to idle.



E80881

17. ⚠ WARNING: Eye protection must be worn.

- CAUTIONS:

⚠ Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

⚠ Since injury such as scalding could be caused by escaping steam or coolant, make sure the vehicle cooling system is cool prior to carrying out this procedure

Disconnect the fuel cooler coolant return line.

- Allow any trapped air to escape.

18. Connect the fuel cooler coolant return line.

19. When coolant runs from the expansion tank bleed point bubble-free, tighten the bleed screw.

20. Add coolant to the expansion tank until the coolant level is 25 mm (0.98 inch) above the "COLD FILL RANGE" upper mark.

21. Hold the engine speed at 2,000 RPM for 25 seconds.

22. Allow the engine to idle for 30 seconds.

23. CAUTIONS:

⚠ Observe the engine temperature gauge. If the engine starts to over-heat switch off immediately and allow to cool. Failure to follow this instruction may cause damage to the vehicle

⚠ Make sure the coolant level remains above the "COLD FILL RANGE" lower level mark.

Repeat the above 2 steps 3 times or until hot air is emitted from the heater.

24. Allow the engine to idle for 30 seconds.

25. Add coolant to the expansion tank until the coolant level is 25 mm (0.98 inch) above the "COLD FILL RANGE" upper mark.

- Install the coolant expansion tank cap.

26. ⚠ CAUTION: Observe the engine temperature gauge. If the engine starts to over-heat switch off immediately and allow to cool. Failure to follow this instruction may cause damage to the vehicle

Start and run the engine until the thermostat opens.

- Switch the engine off and allow to cool.

27. ⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

⚠CAUTION: If topping up the cooling system when HOT, the HOT fill level with the coolant expansion tank cap removed is significantly higher, 50 mm (2 inches) than the COLD fill level. Failure to compensate for this may lead to significant under filling of the cooling system and may lead to incorrect diagnosis and coolant loss.

Check and top-up the coolant if required.

28. Disconnect the exhaust extraction hoses from the tail pipes.

29. Clean any spilt coolant from the vehicle.

30. Install the engine undershield.
For additional information, refer to: Radiator Splash Shield (501-02, Removal and Installation).

Engine Cooling - TDV8 3.6L Diesel - Auxiliary Radiator

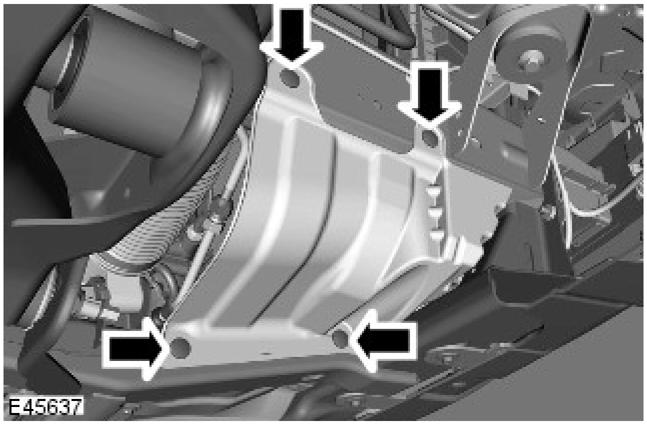
Removal and Installation

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

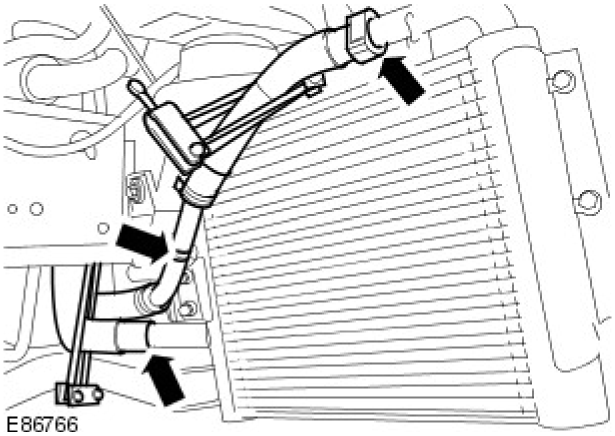
Raise and support the vehicle.

2. Remove the front RH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).



3. Remove the front RH splash shield.

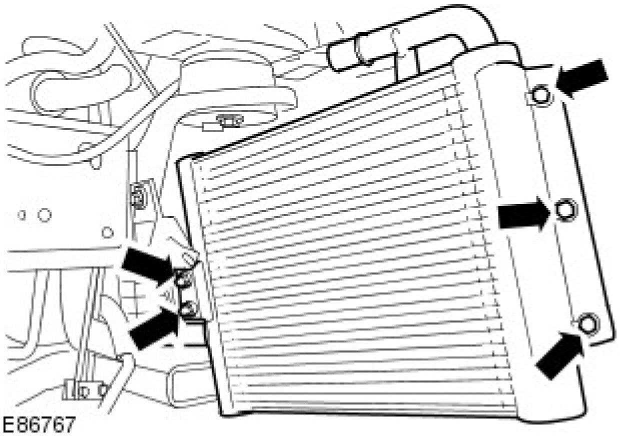
- Remove the 4 clips.



4. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Disconnect the 2 coolant hoses.

- Clamp the hose to minimize coolant loss.
- Release the coolant pipe from the clip.
- Position a container to collect the fluid spillage.



5. Remove the auxiliary radiator.

- Remove the 5 bolts.

Installation

1. Install the auxiliary radiator.
    - Tighten the bolts to 20 Nm (15 lb.ft).
2. NOTE: Remove and discard the blanking caps.

   Connect the coolant hoses.
    - Secure the coolant pipe in the clip.
    - Remove the coolant hose clamps.
    - Remove the container.
3. Install the front RH splash shield.
    - Install the clips.
4. Install the front RH fender splash shield.
   For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).
5. Check and top-up the coolant.

Removal and Installation

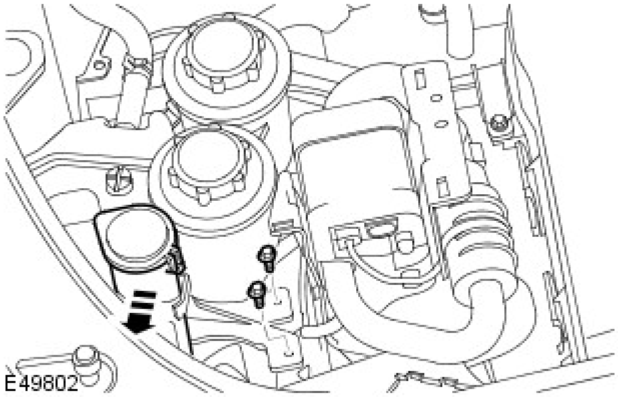
Removal

1. Remove the LH headlamp assembly.
For additional information, refer to: Headlamp Assembly (417-01 Exterior Lighting, Removal and Installation).

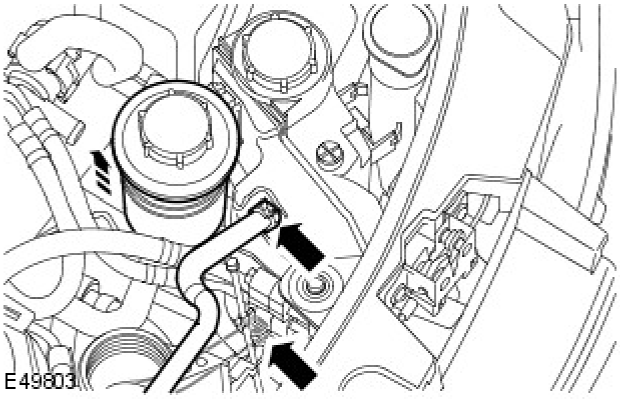
2. Release the windshield washer reservoir filler neck.

3. Release the coolant expansion tank.

- Remove the 2 bolts.



4. Release the power steering fluid reservoir.



5. WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

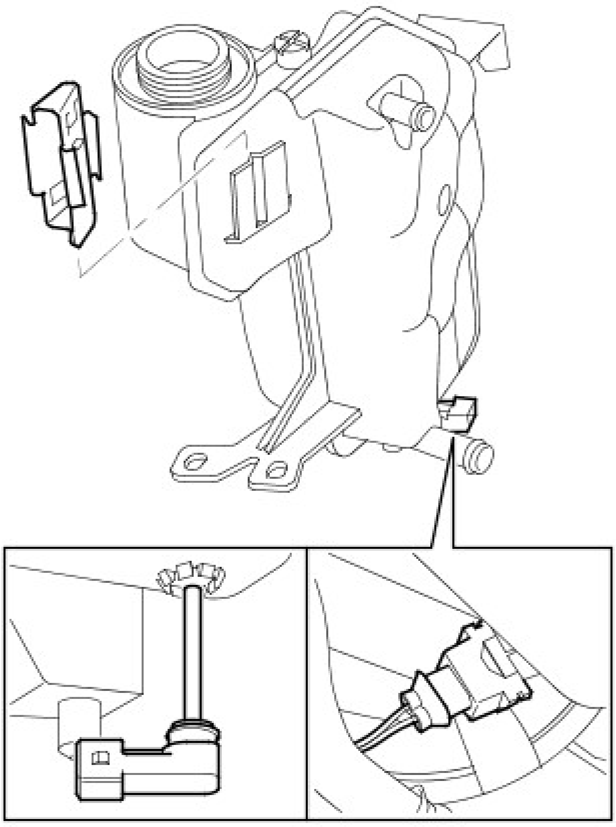
CAUTION: Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

Disconnect the 2 hoses from the coolant expansion tank.

- Position an absorbent cloth to collect fluid spillage.
- Position a container to collect the fluid.
- Clamp the hoses
- Release the 2 clips.

6. Remove the coolant expansion tank.

- Disconnect the coolant low level sensor electrical connector.



7. NOTE: Do not disassemble further if the component is removed for access only.

Remove the coolant low level sensor.

- Remove the coolant expansion tank support bracket.

Installation

1. Install the bracket.

2. Install the coolant low level sensor.

3. Install the coolant expansion tank.

- Connect the coolant low level sensor electrical connector.

4. Connect the coolant hoses to the expansion tank.

- Secure with the clips.

5. Top-up the coolant.

- Loosen the coolant expansion tank bleed screw.
- Fill the coolant expansion tank until coolant emerges from the cooling system air bleed screw.
- Remove the hose clamps.
- Tighten the bleed screw to 8 Nm (6 lb.ft).

6. Secure the coolant expansion tank.

- Tighten the bolts to 10 Nm (7 lb.ft).

7. Check and top-up the coolant.

- Install the coolant expansion tank pressure cap.

8. Secure the power steering fluid reservoir.

- Attach to the mounting bracket.

9. Secure the windshield washer reservoir filler neck.

- Locate in clip.

10. Install the LH headlamp assembly.

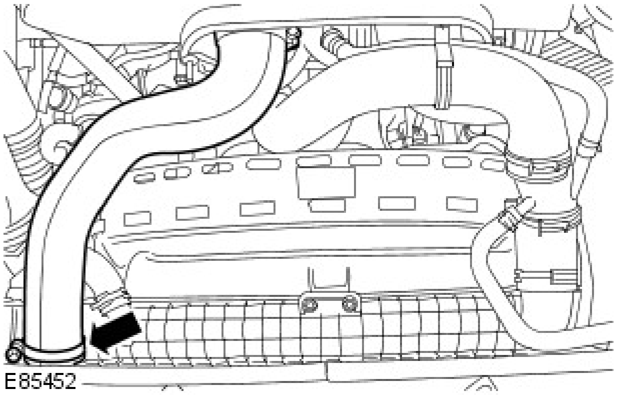
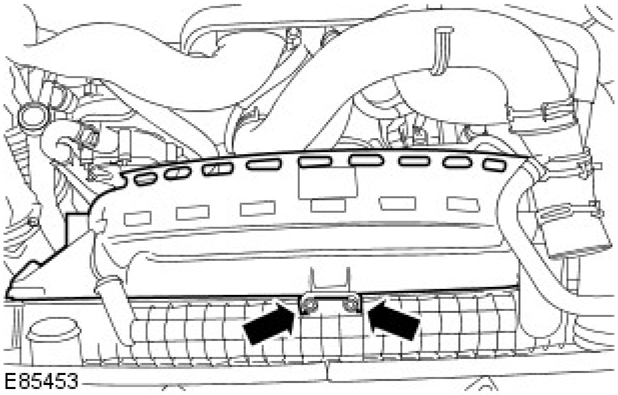
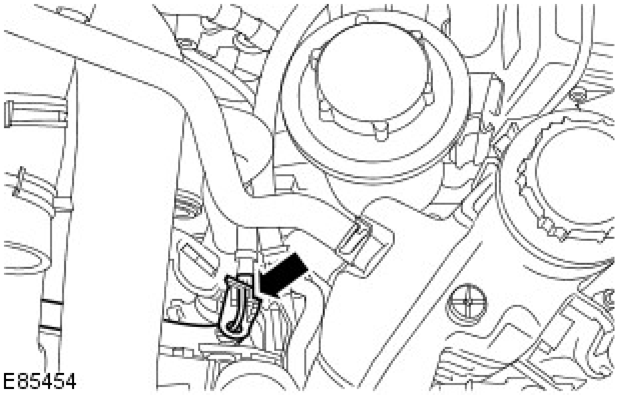
5. Disconnect the auxiliary radiator coolant hose.
    - Release the clip.



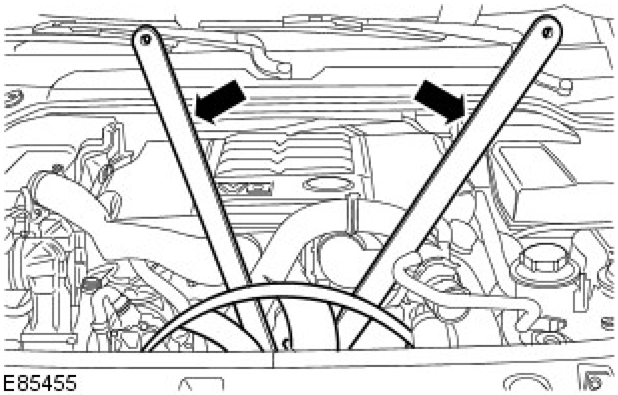
6. Disconnect the RH charge air cooler outlet pipe.
    - Loosen the clip.



7. Remove the cooling fan upper shroud.
    - Release from the 3 clips.

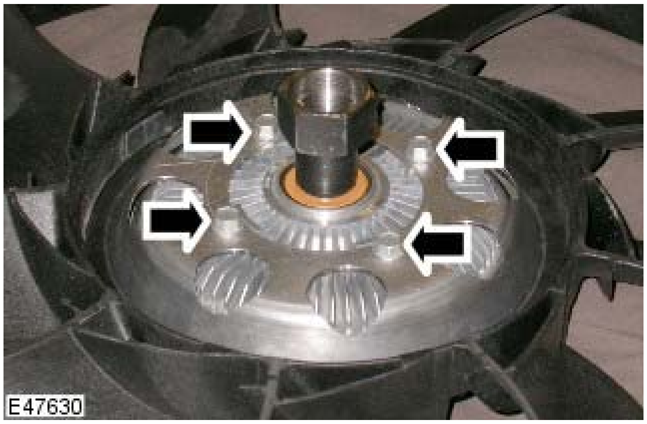


8. Disconnect the cooling fan control electrical connector.
    - Release the cooling fan control electrical connector from the cooling fan lower shroud.



9. NOTE: The thread is left handed.

Using the special tools, remove the cooling fan.



10. NOTE: Do not disassemble further if the component is removed for access only.

Remove the viscous coupling.

- Remove the 4 bolts.

Installation

1. To install, reverse the removal procedure.

- Tighten the viscous coupling bolts to 10 Nm (7 lb.ft).
- Tighten the cooling fan nut to 65 Nm (48 lb.ft).

2. Fill and bleed the cooling system.

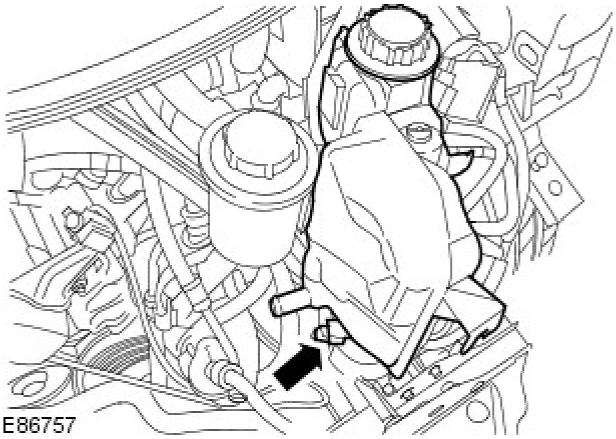
7. ⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank while the system is hot.

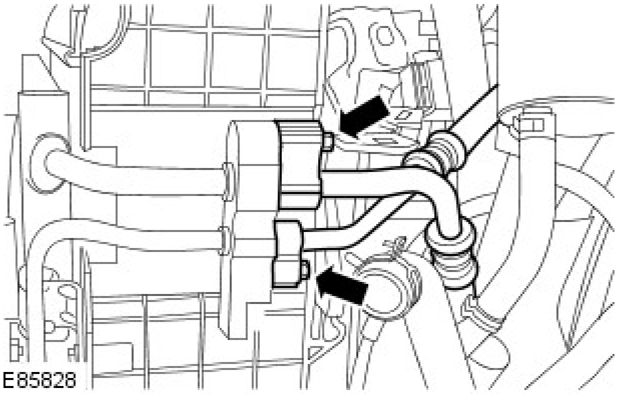
   ⚠ CAUTION: Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

   Disconnect the 2 hoses from the coolant expansion tank.
   - Release the 2 clips.



8. Remove the coolant expansion tank.

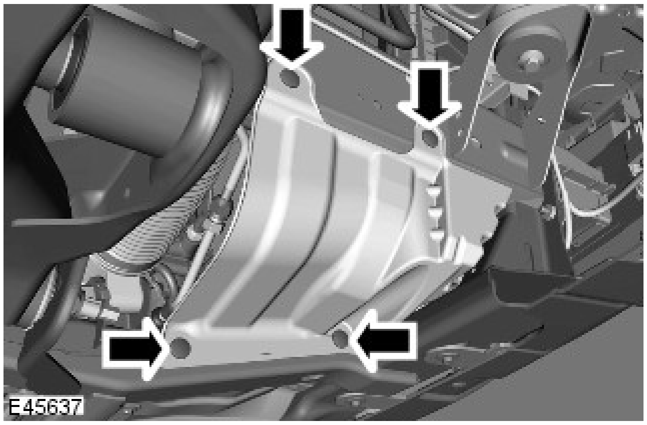
- Disconnect the coolant low level sensor electrical connector.



9. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

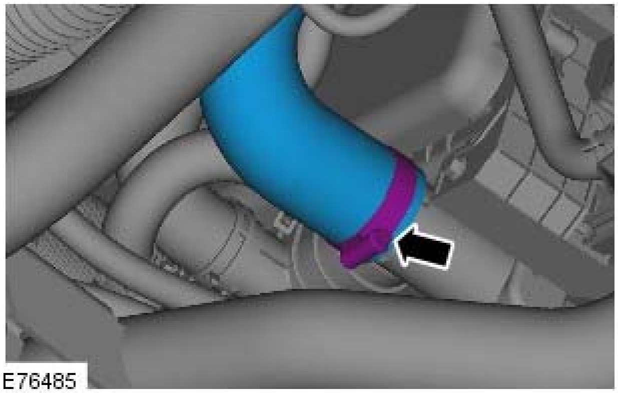
Release the 2 A/C refrigerant lines.

- Remove the 2 bolts.
- Remove and discard the 2 O-ring seals.



10. Remove the front RH splash shield.

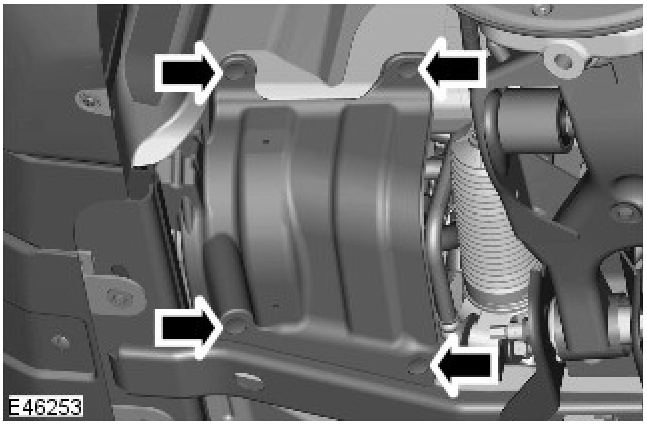
- Remove the 4 clips.



11. ⚠ CAUTION: Make sure that the inside of the pipe ends are clean and free of oil residue.

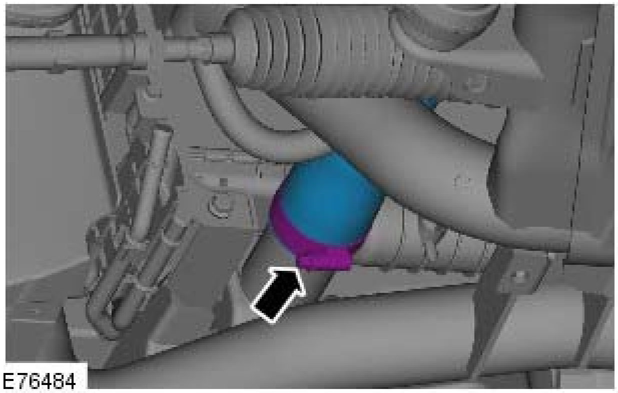
Disconnect the RH charge air cooler inlet hose.

- Release the clip.



12. Remove the front LH splash shield.

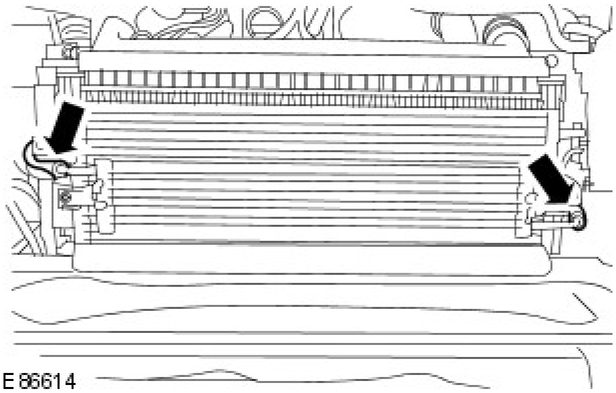
- Remove the 4 clips.



13. ⚠ CAUTION: Make sure that the inside of the pipe ends are clean and free of oil residue.

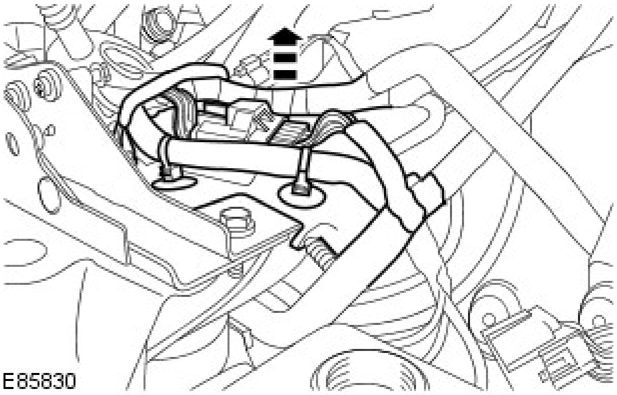
Disconnect the LH charge air cooler inlet hose.

- Release the clip.



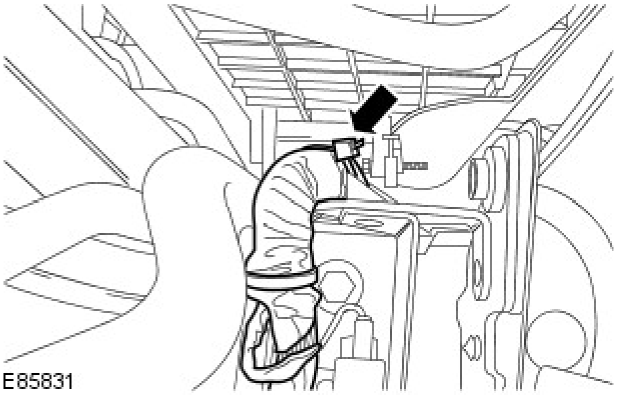
14. Disconnect the 2 coolant pipes from the auxiliary fuel cooler.

- Release the 2 quick release connectors.



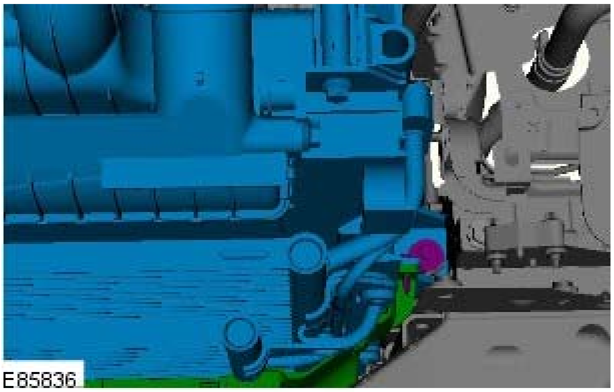
15. LH front, release the wiring harness bracket.

- Release the 2 clips.



16. RH front, release the wiring harness.

- Release the clip.



17. ⚠ CAUTION: Care must be taken to avoid damaging the engine bay wiring harnesses.

• NOTE: LH illustration is shown, RH is similar.

With assistance, remove the cooling module.

- Remove the 2 bolts.
- Remove the 2 screws.

Installation

1. ⚠ CAUTION: Care must be taken to avoid damaging the engine bay wiring harnesses.

With assistance, install the cooling module.

- Tighten the bolts to 24 Nm (18 lb.ft).

2. RH front, secure the wiring harness.

- Secure the clip.

3. LH front, secure the wiring harness.

- Secure the clips.

4. Secure the coolant pipes to the auxiliary fuel cooler.

- Secure the clips.

5. Install the front LH splash shield.

- Install the clips.

6. Connect the charge air cooler LH inlet hose.

- Secure with the clip.

7. Install the front RH splash shield.

- Install the clips.

8. Connect the charge air cooler RH inlet hose.

- Secure with the clip.

9. NOTE: Remove and discard the blanking caps.

Secure the A/C refrigerant lines.

- Install the new O-ring seals.
- Tighten the bolts to 10 Nm (7 lb.ft).

10. Install the coolant expansion tank.

- Connect the coolant low level sensor electrical connector.

11. Connect the coolant hoses to the expansion tank.

- Secure the clips.

12. Install the cooling fan lower shroud.
For additional information, refer to: Cooling Fan Shroud (303-03E Engine Cooling - TDV8 3.6L Diesel, Removal and Installation).

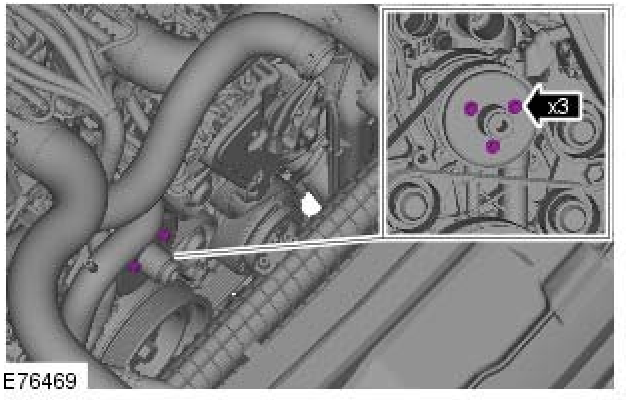
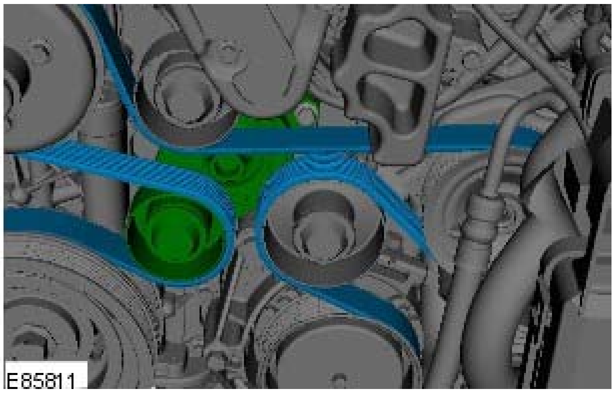
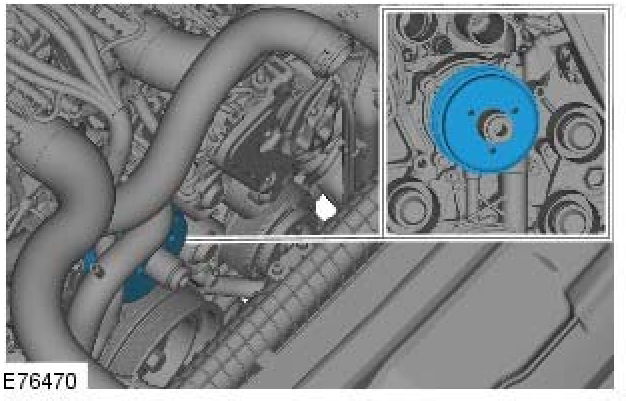
3. Remove the accessory drive belt.
   For additional information, refer to: Accessory Drive Belt (303-05D Accessory Drive - TDV8 3.6L Diesel, Removal and Installation).

4. Loosen the 3 coolant pump pulley bolts.



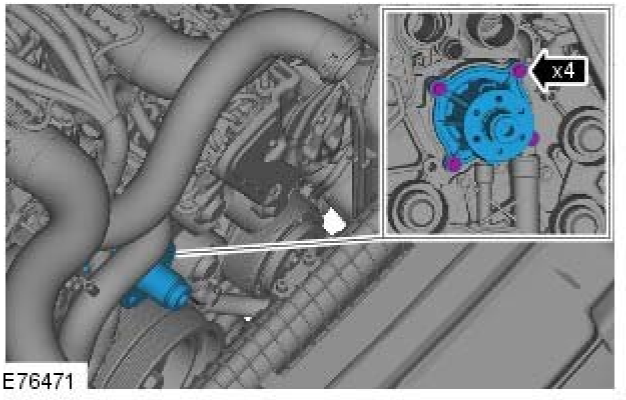
5. Remove the cooling fan belt.
   - Release the tension from the belt.





6. Remove the coolant pump pulley.

- Remove the 3 bolts.



7. ⚠ CAUTION: Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

• NOTE: Some fluid spillage is inevitable during this operation.

Remove the coolant pump.

- Position a container to collect the fluid spillage.
- Remove the 4 bolts.
- Remove and discard the O-ring seal.

Installation

1. NOTE: Lubricate the new O-ring seal with clean engine coolant.

Install the coolant pump.

- Install a new O-ring seal.
- Tighten the bolts to 23 Nm (17 lb.ft).
- Remove the container.

2. Install the coolant pump pulley.

- Loosely install the bolts.

3. Install the cooling fan belt.

- Clean and inspect the drive pulleys for damage.

4. Tighten the coolant pump pulley bolts.

- Tighten the bolts to 25 Nm (18 lb.ft).

5. Install the accessory belt.
For additional information, refer to: Accessory Drive Belt (303-05D Accessory Drive - TDV8 3.6L Diesel, Removal and Installation).

2. Raise and support the vehicle.

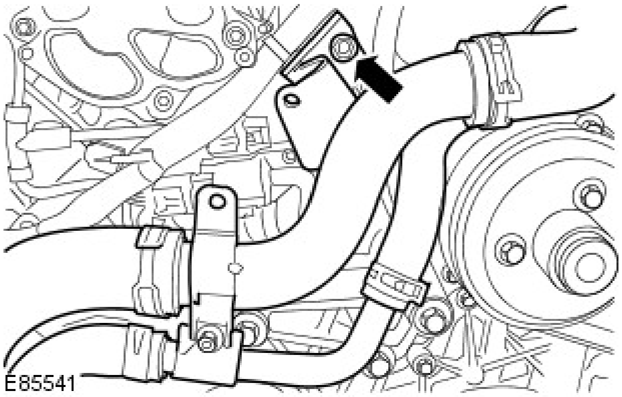
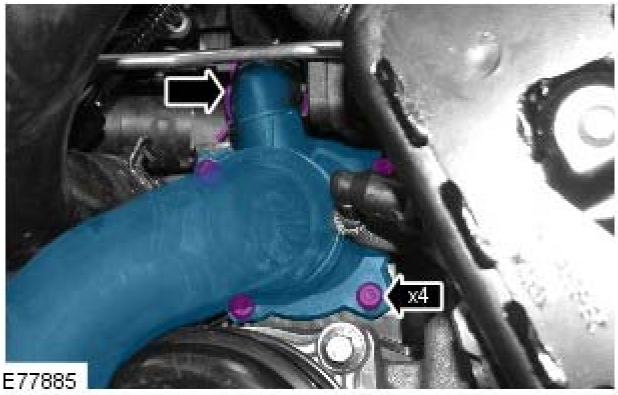
3. Remove the cooling fan assembly.
For additional information, refer to: Cooling Fan (303-03E Engine Cooling - TDV8 3.6L Diesel, Removal and Installation).



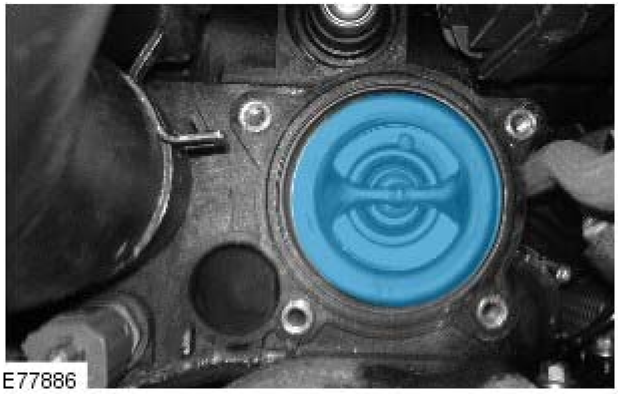
4. Release the coolant hose bracket.

- Remove the nut.
- Release the 2 wiring harness clips.



5. Release the thermostat housing.

- Remove the clip.
- Remove the 4 bolts.
- Remove and discard the O-ring seals.



6. Remove the thermostat.

- Remove and discard the O-ring seal.

Installation

1. NOTE: Lubricate the O-ring seal with clean coolant.

Install the thermostat.

- Install a new O-ring seal.
- Clean the component mating faces.

2. NOTE: Lubricate the O-ring seals with clean coolant.

Secure the thermostat housing.

- Install new O-ring seals.
- Tighten the bolts to 10 Nm (7 lb.ft).
- Install the clip.

3. Secure the coolant hose bracket.

- Tighten the nut to 9 Nm (7 lb.ft).
- Secure the wiring harness.

Engine Cooling - TDV8 3.6L Diesel - Cooling System Pressure Test

General Procedures

• NOTE: The following procedure will enable the cooling system to be pressure tested for condition and leaks. Stage 1 will check the expansion tank cap register seal and the cap for leaks. Stage 2 will check the entire cooling system.

• NOTE: It will be necessary to use the cooling system test kit, Part Number LR-218, which is available under the equipment programme.

1. Examine the coolant hoses for signs of cracking, distortion and security of the hose connections.

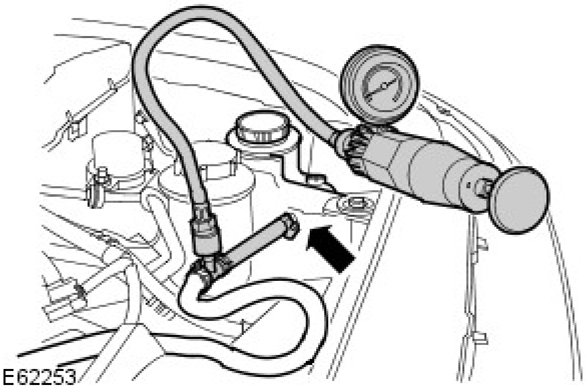
2. ⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, allow the vehicle cooling system to cool prior to carrying out this procedure.

Disconnect the coolant expansion tank bleed hose.

- Release the clip.

3. Install the 'T' piece adaptor (part of the cooling system test kit) between the coolant expansion tank and the coolant bleed hose.

- Secure with the 2 clips.



4. Install the coolant pressure pump assembly.

- Connect to the 'T' piece.

5. Pressurize the cooling system.

- Slowly pressurize the cooling system to 1.0 bar (100 kPa) (14.5 psi).
- Check the pressure remains above 0.9 bar (90 kPa) (13 psi) after waiting for 30 seconds.
- During the pressure drop check, listen for a hissing noise from the expansion tank cap.

6. NOTE: If the coolant expansion tank cap is found to be leaking, replace the cap.

Depressurize the cooling system.

- Disconnect the 'T' piece.
- Connect the coolant expansion tank bleed hose.
- Secure the clip.

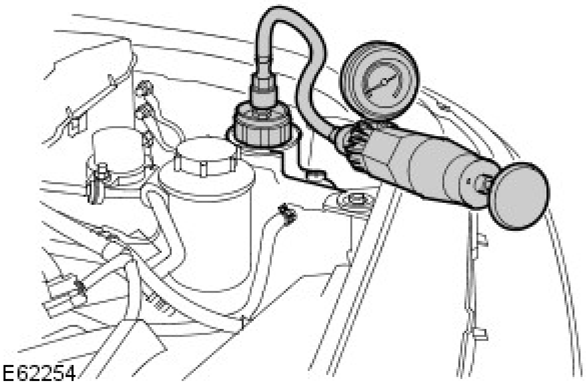
7. ⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, allow the vehicle cooling system to cool prior to carrying out this procedure.

Remove the coolant expansion tank cap.

8. NOTE: This adaptor is part of the cooling system test kit.

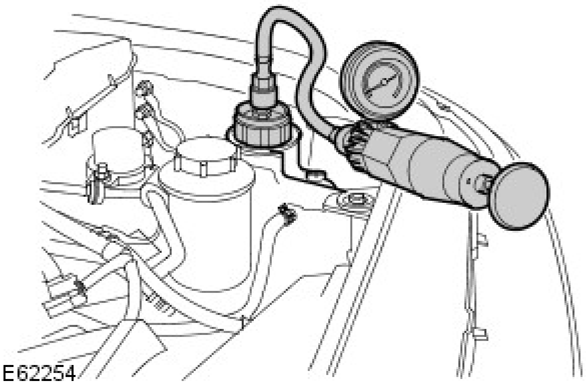
Install adaptor K83 to the coolant expansion tank.

- Clean the component mating faces.
- Lubricate the seal.



9. Install the coolant pressure pump assembly.

- Slowly pressurize the cooling system to 1.5 bar (150kPa) (22 psi), check the pressure over a 5 minute period. A small pressure decay of approximately 0.15 bar (15 »kPa) (1 psi) over the first minute is normal, as the air in the expansion tank cools.
- If the pressure continues to drop after the initial tolerance, there is a coolant leak.



10. Depressurize and remove the pressure pump and gauge.

- Install the coolant expansion tank cap.

4. Remove the engine coolant level switch.

- Disconnect the engine coolant level switch electrical connector.

Installation

1. NOTE: An audible click can be heard when the engine coolant level switch is correctly installed.

Install the engine coolant level switch.

- Connect the engine coolant level switch electrical connector.

2. ⚠CAUTION: Make sure that the component is correctly located on the locating pegs.

Secure the coolant expansion tank.

- Tighten the bolts to 10 Nm (7 lb.ft).

3. Secure the windshield washer reservoir filler neck.

4. Secure the power steering fluid reservoir to the bracket.

GENERAL

The major components of the fuel charging and control system comprise an outlet duct, a fuel pump and control module, fuel rails and eight injectors. The fuel pump supplies fuel from the tank, via a pipe routed along the side of the transmission, to the fuel rail. The fuel rail distributes the fuel equally to each of the eight injectors. The fuel injectors, which are controlled by the Engine Management System (EMS), are installed in the fuel rails on each side of the intercoolers. A cross over pipe connects the two fuel rails together at the front of the engine.

OUTLET DUCT

The outlet duct directs air from the supercharger into the two intercoolers. A filler point for the intercooler coolant system is integrated into the front and right side of the outlet duct. **This connection is not used on Land Rover vehicles.** A vacuum take-off for the speed control system is located on the right side of the outlet duct. Isolating bolts, to reduce noise, secure the outlet duct to the supercharger and a rubber gasket seals the supercharger to the outlet duct interface.

FUEL PUMP

The fuel pump module is mounted in the fuel tank and delivers fuel at variable flow and pressure to the fuel rails, which supply fuel to all fuel injectors. The fuel pump operation is regulated by a fuel pump control module, which is controlled by the EMS. For additional information, refer to:

> Electronic Engine Controls (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, Description and Operation),
> Fuel Tank and Lines (310-01A Fuel Tank and Lines - V8 S/C 4.2L Petrol, Description and Operation).

THROTTLE BODY

The electronic throttle body controls the engine torque and is located on the induction elbow at the rear of the engine. Its main components are an electronic throttle control valve, Accelerator Pedal Position (APP) sensor and the Engine Control Module (ECM).

The APP sensor determines the driver demand to control throttle opening. This value is received by the ECM and the throttle is then opened to the correct angle by means of an integral electric motor. Sensors in the throttle body are used to determine the position of the throttle plate and the rate of change in its angle.
For additional information, refer to: Electronic Engine Controls (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, Description and Operation).

Induction Elbow

The induction elbow provides the interface between the electronic throttle body and the supercharger. Connections on the induction elbow provide vacuum take off's for various vehicle systems.

FUEL RAIL

Item	Part Number	Description
1	-	RH fuel pressure damper
2	-	Injectors (8 of)
3	-	RH fuel rail
4	-	Fuel temperature sensor
5	-	Fuel pressure sensor
6	-	Fuel supply
7	-	LH fuel rail
8	-	LH fuel pressure damper
9	-	Fuel supply cross over pipe

Each fuel rail maintains a fuel pressure of typically 4.5bar (65 psi), however, this pressure will vary depending on engine requirements; lower at idle, higher at full load. Four fuel injectors are installed in each intercooler adapter and are connected to the fuel rail. 'O' ring seals are used to seal the injectors in the fuel rails and the intercooler adapters.

A fuel pressure damper is attached to each of the fuel rails.

FUEL PRESSURE DAMPER

A fuel pressure damper is attached centrally to each of the fuel rails. The damper acts to damp pulses from the fuel pump.

FUEL TEMPERATURE SENSOR

The fuel temperature sensor is located in the rear of the RH fuel rail. The sensor is an NTC sensor, which is connected to the ECM by two wires.
For additional information, refer to: Electronic Engine Controls (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, Description and Operation).

FUEL PRESSURE SENSOR

The fuel pressure sensor continuously monitors the fuel pressure in the fuel rail, this value is used by the ECM to calculate the injector pulse-width required to deliver the correctmass of fuel per injection.

The ECM also uses this information to demand a specific fuel flow-rate from the fuel pump via the fuel pump module.
For additional information, refer to: Electronic Engine Controls (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, Description and Operation).

INJECTORS

Eight, top fed, 12 hole, fuel injectors are installed in the fuel rails. Two 'O' rings seal each injector to the intercooler adapters and fuel rails and should be renewed whenever an injector is refitted to an engine. A small amount of engine oil can be applied to the 'O' rings to aid installation. No other form of lubrication should be used. The fuel jets from the injectors are directed onto the back of the intake valves.

The injectors are electromagnetic solenoid valves controlled by the ECM. Each injector contains a solenoid-operated needle valve, which is closed while the solenoid winding is de-energised. The solenoid winding is connected to a power feed from the main relay and to an earth through the ECM. The ECM switches the earth to control the opening and closing of the needle valve. While the needle valve is open, fuel is sprayed into the cylinder intake tract onto the back of the intake valves. The ECM metres the amount of fuel injected by adjusting the time that the needle valve is open.

Diagnosis and Testing

Overview

For information on the operation of the system, refer to the workshop manual section: 303-04 - Fuel Charging and Controls.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
● Fuel leaks ● Damaged fuel lines ● Damaged push connect fittings ● Fuel level ● Fuel contamination/grade/quality ● Throttle body ● Damaged fuel tank filler pipe cap ● Damaged fuel tank filler pipe	● Fuses ● Inertia switch ● Loose or corroded electrical connectors ● Harnesses ● Sensor(s) ● Engine control module (ECM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
   - Make sure that all DTCs are cleared following rectification.

Symptom Chart

Symptom	Possible causes	Action
Engine cranks, but does not fire	● Low/Contaminated fuel ● Ignition system ● Fuel system ● Crankshaft position (CKP) sensor ● Harness ● ECM fault	Check the fuel level and condition. For ignition system tests, refer to the relevant section of the workshop manual. Check for injector DTCs. For CKP and harness tests. Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a module is suspect.
Engine cranks and fires, but will not start	● Evaporative emissions purge valve ● Fuel system ● Spark plugs ● Ignition coil failure(s)	For purge valve tests, refer to the relevant section of the workshop manual. Check for injector DTCs. For ignition system tests, refer to the relevant section of the workshop manual.
Difficult to start cold	● Check coolant anti-freeze content ● Battery ● Crankshaft position (CKP) sensor ● Fuel system ● Evaporative emissions purge valve	For battery information, refer to the relevant section of the workshop manual. For CKP sensor tests, refer to the relevant section of the workshop manual. Check for injector DTCs. For purge valve tests, refer to the relevant section of the workshop manual.
Difficult to start hot	● Injector leak ● Fuel system ● Fuel temperature sensor ● Intake air temperature (IAT) sensor ● Mass air flow (MAF) sensor ● Evaporative emissions	Check for injector DTCs. 3	-	Fuel supply cross over pipe
4	-	Intake manifold
5	-	RH fuel rail
6	-	Fuel jump hose

GENERAL

The major components of the fuel charging and control system comprise an intake manifold, a fuel pump, a fuel rail and eight injectors. The fuel pump supplies fuel from the tank at a constant pressure, via a pipe routed along the side of the transmission, to the fuel rail. The fuel rail distributes the fuel equally to each of the eight injectors. The fuel injectors, which are controlled by the Engine Control Module (ECM), are installed in the fuel rails on each side of the intake manifold. A cross over pipe connects the two fuel rails together at the front of the manifold. A Schraeder valve provides a pressure test connection for maintenance.

INTAKE MANIFOLD

The intake manifold is located on top of the engine between the two cylinder banks and is manufactured from a composite material. The manifold comprises a central chamber with eight tracts leading to the inlet ports on the engine. The air intake manifold is secured to the cylinder heads via 10 bolts.

Rubber gaskets, located in channels in the intake manifold, seal the joints between the ducts and the cylinder heads.
For additional information, refer to: Intake Air Distribution and Filtering (303-12B Intake Air Distribution and Filtering - V8 4.4L Petrol, Description and Operation).

FUEL PUMP

The submersible electric fuel pump is attached to a carrier and is located at the bottom of the swirl pot inside the fuel tank. The fuel pressure regulator, which controls the fuel pressure in the feed pipe to fuel rail, is located in the fuel manifold in the fuel tank.
For additional information, refer to: Fuel Tank and Lines (310-01A Fuel Tank and Lines - V8 S/C 4.2L Petrol, Description and Operation).

THROTTLE BODY

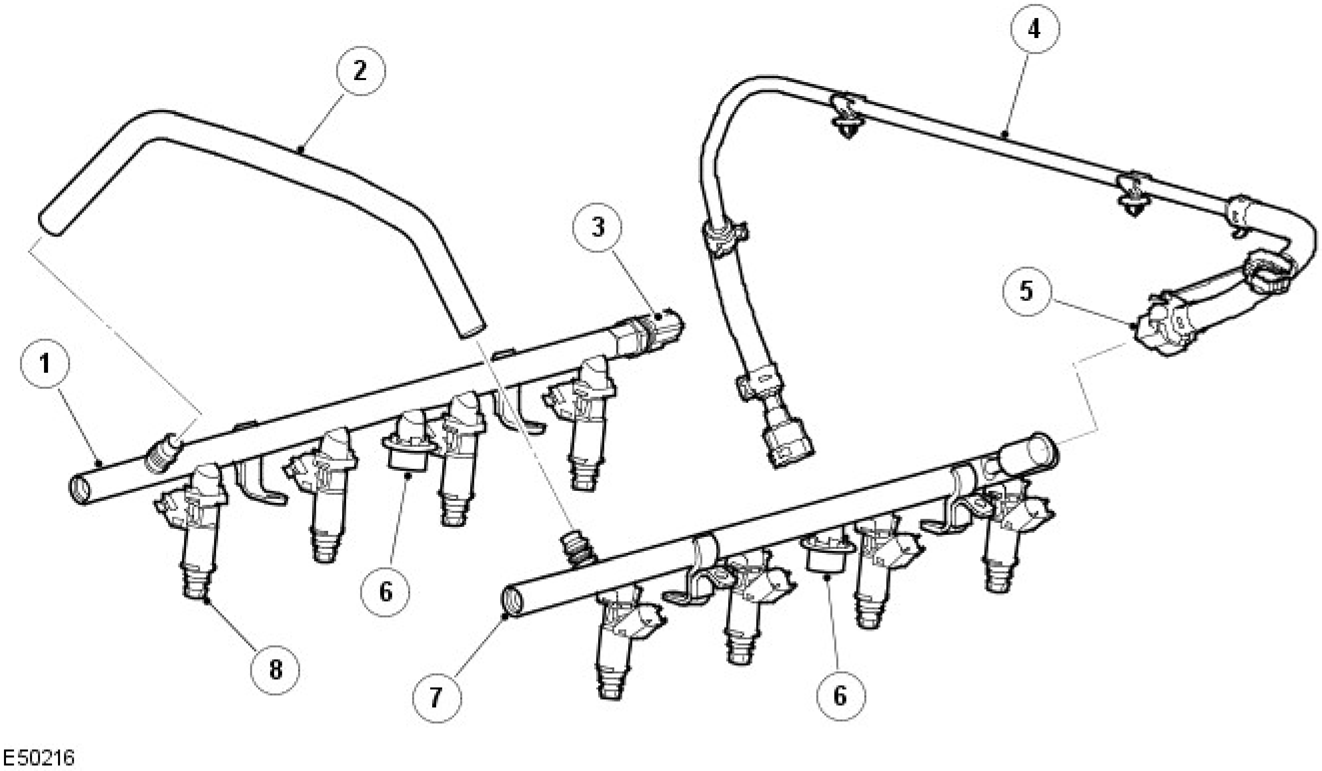
The electronic throttle body controls the engine torque and is located on the air intake manifold. Its main components are, an electronic throttle control valve, Accelerator Pedal Position (APP) sensor and the ECM.

The APP sensor determines the driver demand to control throttle opening. This value is received by the EMS and the throttle is then opened to the correct angle by means of an integral electric motor. Sensors in the throttle body are used to determine the position of the throttle plate and the rate of change in its angle.
For additional information, refer to: Electronic Engine Controls (303-14B Electronic Engine Controls - V8 4.4L Petrol, Description and Operation).

Induction Elbow

The induction elbow provides the interface between the electronic throttle body and the intake manifold. Connections on the induction elbow provide vacuum take off's for various vehicle systems. A boss on the rear of the elbow accommodates the Exhaust Gas Recirculation (EGR) valve.

FUEL RAIL



Item	Part Number	Description
1	-	RH fuel rail
2	-	Fuel supply cross over pipe
3	-	Fuel temperature sensor
4	-	Fuel jump hose
5	-	Cooper fitting
6	-	Fuel pressure damper
7	-	LH fuel rail
8	-	Injectors (8 of)

Each fuel rail maintains a constant fuel pressure of 4.5bar (65 psi). Four fuel injectors are installed in each injector housing and are connected to the fuel rail. 'O' ring seals are used to seal the injectors in the fuel rails and inlet manifold. A 'Cooper' style fitting is used to connect the fuel jump hose to the LH fuel rail.

A fuel pressure damper is attached to each of the fuel rails.

FUEL PRESSURE DAMPER

A fuel pressure damper is attached centrally to each of the fuel rails. The dampers act to damp pulses from the pump and ensure that the fuel pressure in the rail and to the injectors is constant.

FUEL TEMPERATURE SENSOR

The fuel temperature sensor is located in the rear of the RH fuel rail. The sensor is an NTC sensor, which is connected to the ECM by two wires.
For additional information, refer to: Electronic Engine Controls (303-14B Electronic Engine Controls - V8 4.4L Petrol, Description and Operation).

INJECTORS

Eight, top fed, eight hole, fuel injectors are installed in the fuel rails. Two 'O' rings seal each injector to the manifold interface and should be renewed whenever an injector is refitted to an engine. A small amount of engine oil can be applied to the 'O' rings to aid installation. No other form of lubrication should be used. The fuel jets from the injectors are directed onto the back of the intake valves.

The injectors are electromagnetic solenoid valves controlled by the ECM. Each injector contains a solenoid-operated needle valve,

which is closed while the solenoid winding is de-energised. The solenoid winding is connected to a power feed from the main relay and to an earth through the ECM. The ECM switches the earth to control the opening and closing of the needle valve. While the needle valve is open, fuel is sprayed into the cylinder intake tract onto the back of the intake valves. The ECM meters the amount of fuel injected by adjusting the time that the needle valve is open.

Diagnosis and Testing

Overview

For information on the operation of the system, refer to the workshop manual section 303-04 - Fuel Charging and Controls.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
● Fuel leaks ● Damaged fuel lines ● Damaged push connect fittings ● Fuel level ● Fuel contamination/grade/quality ● Throttle body ● Damaged fuel tank filler pipe cap ● Damaged fuel tank filler pipe	● Fuses ● Inertia switch ● Loose or corroded electrical connectors ● Harnesses ● Sensor(s) ● Engine control module (ECM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom Chart

Symptom	Possible causes	Action
Engine cranks, but does not fire	● Low/Contaminated fuel ● Ignition system ● Fuel system ● Crankshaft position (CKP) sensor ● Harness ● ECM fault	Check the fuel level and condition. For ignition system tests, refer to the relevant section of the workshop manual. Check for injector DTCs. For CKP and harness tests. Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a module is suspect.
Engine cranks and fires, but will not start	● Evaporative emissions purge valve ● Fuel system ● Spark plugs ● Ignition coil failure(s)	For purge valve tests, refer to the relevant section of the workshop manual. Check for injector DTCs. For ignition system tests, refer to the relevant section of the workshop manual.
Difficult to start cold	● Check coolant anti-freeze content ● Battery ● Crankshaft position (CKP) sensor ● Exhaust gas recirculation (EGR) valve stuck open ● Fuel system ● Evaporative emissions purge valve	For battery information, refer to the relevant section of the workshop manual. For CKP sensor tests, refer to the relevant section of the workshop manual. Check for injector DTCs. For purge valve tests, refer to the relevant section of the workshop manual.
Difficult to start hot	● Injector leak ● Fuel system ● Fuel temperature sensor ● Intake air temperature (IAT) sensor ● Mass air flow (MAF)	Check for injector DTCs. For fuel temperature sensor, IAT sensor and MAF sensor tests, refer to the relevant section of the workshop manual. For purge valve and ignition system tests, refer to the relevant section of the workshop manual.

Symptom	Possible causes	Action

GENERAL

The TdV6 engine is equipped with a High-Pressure (HP) common rail fuel injection system. With this fuel injection process, a High-Pressure Pump (HPP) delivers a uniform level of pressure to the shared fuel lines (the common rails), which serve all six fuel injectors. Pressure is controllable, to the optimum level for smooth operation, up to 1650 bar.

The common rail system supports a pre-injection (pilot) phase, which reduces combustion noise and mechanical load.

Fuel injection pressure is generated independently of engine speed and fuel injection events.

The fuel injection timing and volume are calculated by the Engine Control Module (ECM), which then energizes the appropriate piezo actuated injector.

The common rail fuel injection system has the following features:

- High fuel injection pressures of up to 1650 bar for greater atomisation of fuel (increasing performance and lowering emissions)
- Variable injection to optimise combustion in all engine operating conditions
- Low tolerances and high precision throughout the life of the system

The fuel system is divided into 2 sub systems:

- Low-Pressure (LP) system
- HP system.

The LP system features the following components:

- In-tank fuel pump
- Fuel pressure regulator (integral to the fuel delivery module)
- Fuel filter
- Return pipes and fuel cooler
- Injector return pipes
- Fuel coolers (engine and vehicle)

The LP system pressure is regulated to 0.5 bar.

The HP system features the following components:

- HPP
- Common fuel rails and diverter rail
- HP fuel pipes
- Injectors.

LP SYSTEM

In-tank Fuel Pump

The electric fuel pump is located inside the fuel tank. Fuel is pumped from the tank via the in-tank fuel pump, to the HPP via the fuel filter.
For additional information, refer to: Fuel Tank and Lines (310-01C Fuel Tank and Lines - TDV6 2.7L Diesel, Description and Operation).

Fuel Filter

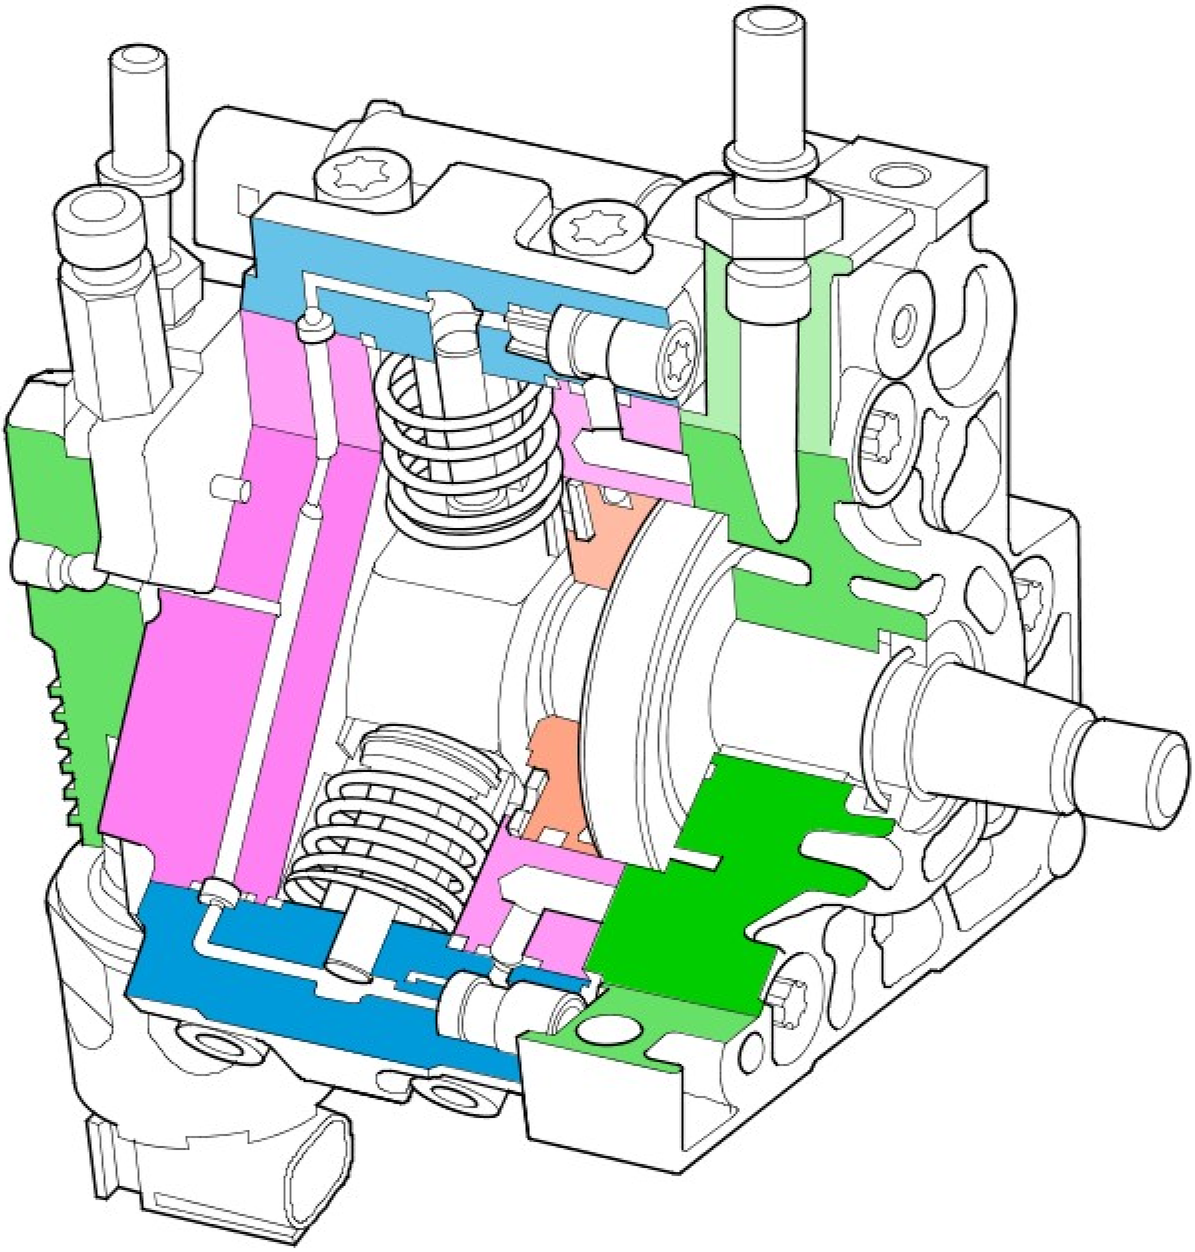
The fuel filter is located in the engine compartment on the left hand side, packaged to be protected against damage. Incorporated in the fuel filter housing is a bimetallic temperature valve, which will start to close at 30°C (86°F) and will fully close at 50°C (122°F). This allows pre-heated diesel fuel to circulate inside the fuel filter to prevent waxing in cold operating conditions.

Fuel Cooler

Two fuel coolers are fitted to the vehicle. One is located in the 'vee' of the engine block, and has a coolant system connection to aid heat transfer. The second cooler is located in the fuel return line and is a fuel to air cooler.
For additional information, refer to: Fuel Tank and Lines (310-01C Fuel Tank and Lines - TDV6 2.7L Diesel, Description and Operation).

HP SYSTEM

HPP



E50833

The HPP is a three-piston (120 degree apart) radial plunger pump with a HP displacement of 0.8 cc. As mentioned, it has the ability to produce a maximum pressure of 1650 bar. The housing is cast from iron, the flange is cast from aluminium.

The pump is driven from the camshaft via a toothed belt. It does not need to be timed to the engine during belt replacement in service.

The required supply pressure to the HPP is -0.3 bar to +0.5 bar gauge. The return pressure is -0.3 bar to +0.8 bar gauge.

The pump is sized to deliver sufficient fuel to the HP rails for all engine-operating conditions.

The HPP consists of the following components:

- Internal Transfer Pump (ITP)
- Volume Control Valve (VCV)
- HP pumping elements (3 of)
- Pressure Control Valve (PCV)

The ITP is a 5 vane pump. This conveys fuel to the VCV.

The VCV is a variable position solenoid valve electronically controlled by the ECM. The VCV is located between the ITP and the HP pumping elements. The VCV determines the amount of fuel that is delivered to the HP pumping elements. When there is no signal to the VCV the valve is closed, therefore no fuel delivery.

The 3 HP pumping elements are connected together in a fuel ring circuit within the pump. There is a single HP outlet connection for the HP pipe to the HP diverter rail.

The PCV is a variable position solenoid valve electronically controlled by the ECM. The PCV is located between the HP pumping elements and the HP outlet connection. The PCV regulates the amount of fuel pressure in the fuel rails and is controlled by the ECM. When there is no signal to the PCV the valve is open, therefore no rail pressure can be generated.

13	-	HPP elements (3 of)
14	-	Lubricating valve

The fuel induced by the ITP (5) is conveyed to the VCV (4) and the lubricating valve (14).

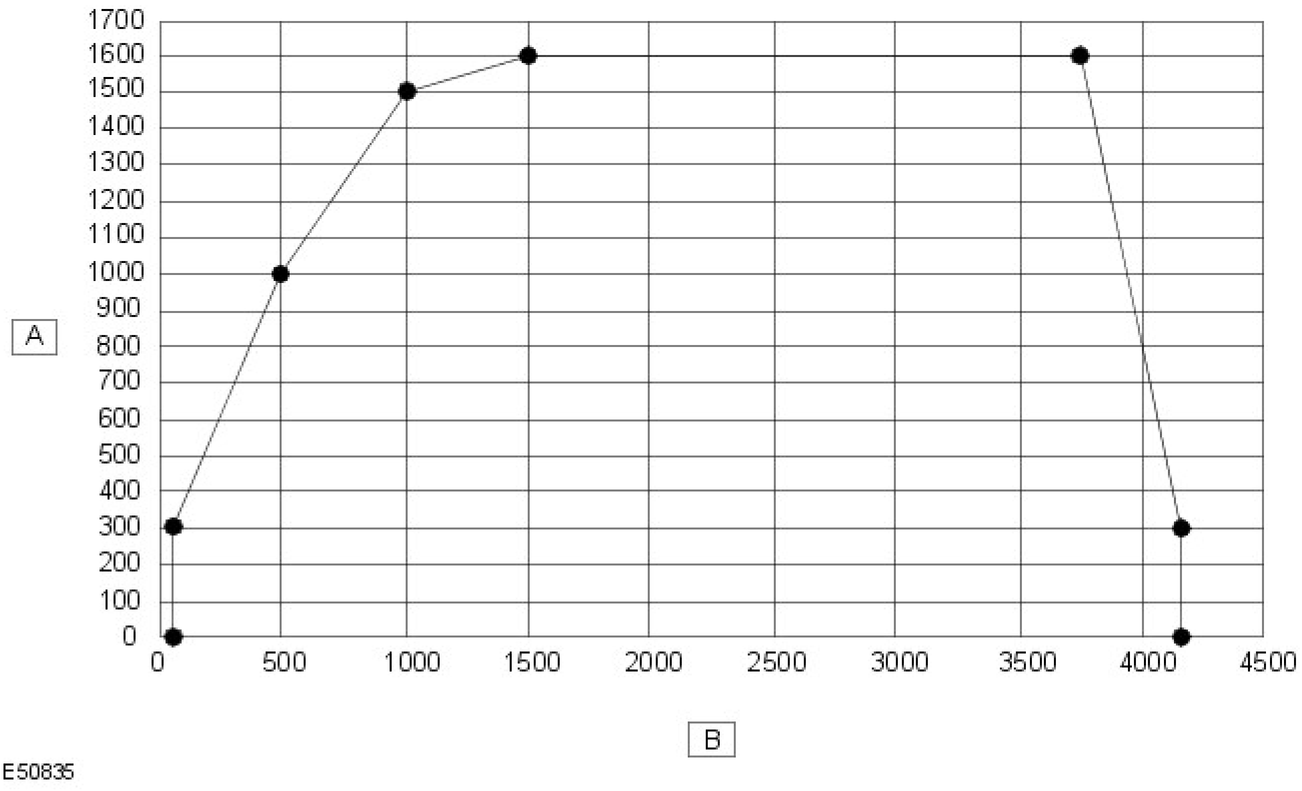
When the VCV is closed, the ITP pressure relief valve (2), lying parallel to the transfer pump, opens and conveys the fuel back to the LP side (1) of the transfer pump.

The fuel passes through the lubricating valve (14) into the interior of the HPP and from there to the fuel return (D). The fuel is used to lubricate the pump.

The VCV (4) determines the quantity of fuel (B) that is supplied to the pumping elements (13).

The fuel from the HP outlets (11) of the three pumping elements comes together in a ring line (12) and is conveyed through the HP outlet of the HPP to the rails.

The PCV (7) regulates the fuel pressure in the fuel rails. Reducing rail pressure via the PCV results in fuel from the rail returning to the LP fuel return (D).



Item	Part Number	Description
A	-	Pump pressure (bar)
B	-	Pump speed (rpm)

The HPP can supply up to 1600 bar fuel pressure continuously with short excursions to 1650 bar. Pump speed is 5/6 engine speed. However it is calibrated to deliver fuel pressure dependant upon engine speed and load and is always under full control.

When the HPP is rotated, pressure is created when the VCV is open and the PCV is closed. The VCV and PCV are variable position to allow variable fuel delivery and pressure control.

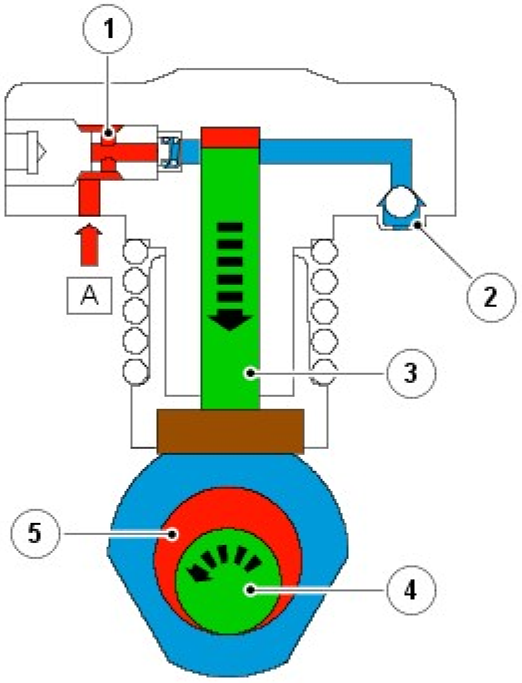
When the ECM actuates the piezo actuators, the rail pressure drop is off-set by additional fuel being delivered to the HP rails by the PCV.

Pressure Reduction After Engine Has Stopped

The fuel pressure in the system is reduced within a few seconds after the engine has stopped as the PCV no longer has the holding current it requires, and therefore opens. No residual pressure remains in the system and the fuel is returned to the fuel return line (D) through the open PCV. The system is pressureless.

Function of a High Pressure Element

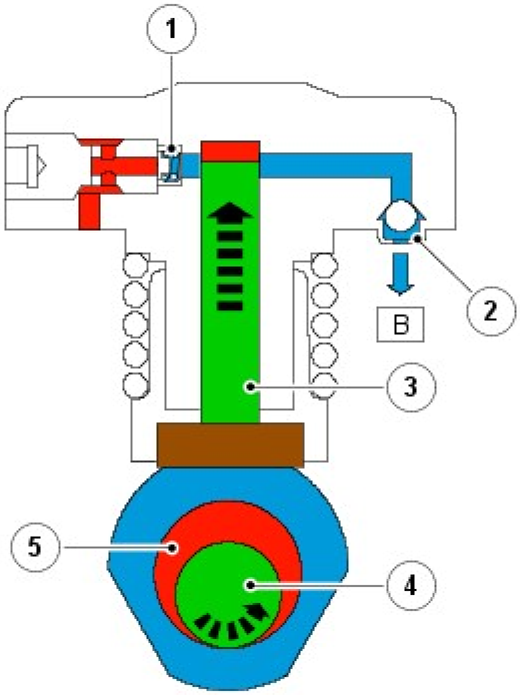
Fuel Induction



E50836

During the downward motion of the piston (3), a vacuum in the pump cylinder is generated, which opens the inlet valve (1) against the force exerted by the valve spring. The fuel (A), which is flowing past the VCV, is sucked in. At the same time the outlet valve (2) is closed due to the pressure difference between the pump cylinder and the HP fuel in the ring line.

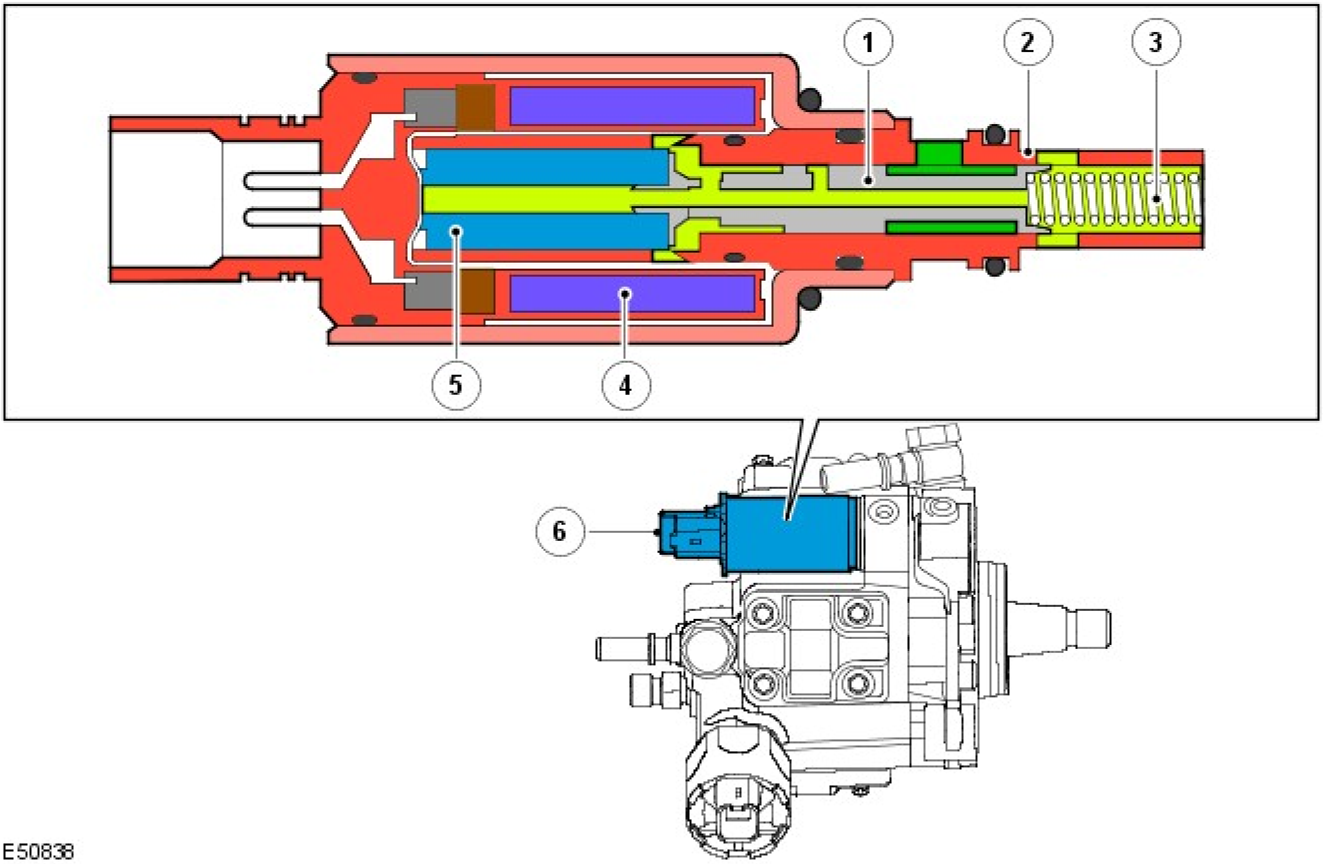
Fuel Delivery



E50837

The eccentric on the HPP driveshaft (5) presses the piston (3) upwards. The inlet valve (1) is then closed through the force exerted by the valve spring and the pressure being built up in the pump cylinder. The outlet valve (2) opens when the pressure in the pump cylinder is greater than the fuel pressure in the ring line (B).

Volume Control Valve (VCV)



Item	Part Number	Description
1	-	Piston
2	-	Sleeve
3	-	Compression spring
4	-	Coil
5	-	Armature
6	-	VCV

The VCV is fixed directly to the HPP.

The VCV regulates the fuel supply (and hence the quantity of fuel) from the transfer pump to the HPP elements, depending on the fuel pressure in the rail.

This makes it possible to match the delivery of the HPP to the requirements of the engine from the low-pressure side. The quantity of fuel flowing back to the main fuel supply line is kept to a minimum.

In addition, this adjustment reduces the power consumption of the HPP, improving the efficiency of the engine.

- NOTE: The fuel volume control valve default is closed without electrical supply. An open circuit connector will prevent the engine from running.

- NOTE: The VCV cannot be replaced as a separate component in service.

B	-	VCV actuated

2	-	Piston
3	-	Fuel supply to the HPP
4	-	Coil energised
5	-	Quantity of fuel
6	-	Control current
7	-	VCV at constant engine speed

VCV Not Actuated (A)

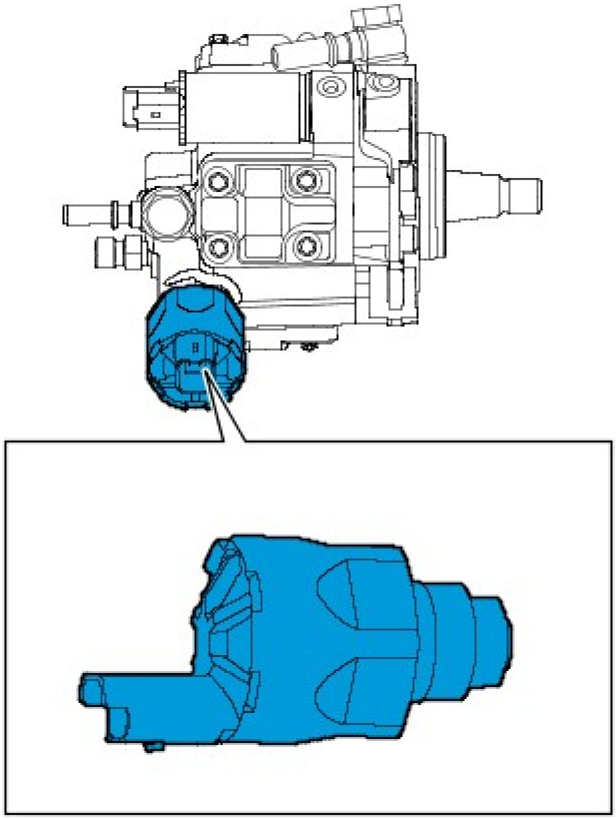
When there is no power supplied, the piston (2) closes the opening between the two connections (1) and (3) through the force of the compression spring. The fuel supply to the HPP is interrupted.

VCV Actuated (B)

The ECM energizes the coil (4) of the valve, according to the engines requirements. The armature force is proportional to the control current and counteracts the compression spring through the moving piston (2).

As a result, the opening between the two connections (1) and (3) and hence the quantity of fuel (5) supplied through the connector (3) to the HPP is also proportional to the control current (6). This means that the greater the opening cross-section, the greater the quantity of fuel supplied.

Pressure Control Valve (PCV)



E50840

The PCV is located on the HPP. It governs the fuel pressure at the HP outlet of the HPP and thus, the fuel pressure within the rail. In addition, the PCV dampens any fluctuations in pressure, which occur during the delivery of fuel through the HPP and through the injection process.

The PCV ensures that optimum pressure exists in the rail for every operating condition of the engine.

The PCV is an electro-magnetically operated valve with spring support.

The electrical current supplied by the ECM through the solenoid pulls back the control pin. This allows the diesel fuel to pass the ball valve and thus the fuel flow into the common rails.

The entire armature is coated with fuel for lubrication and cooling.

- NOTE: The PCV cannot be replaced as a separate component in service.

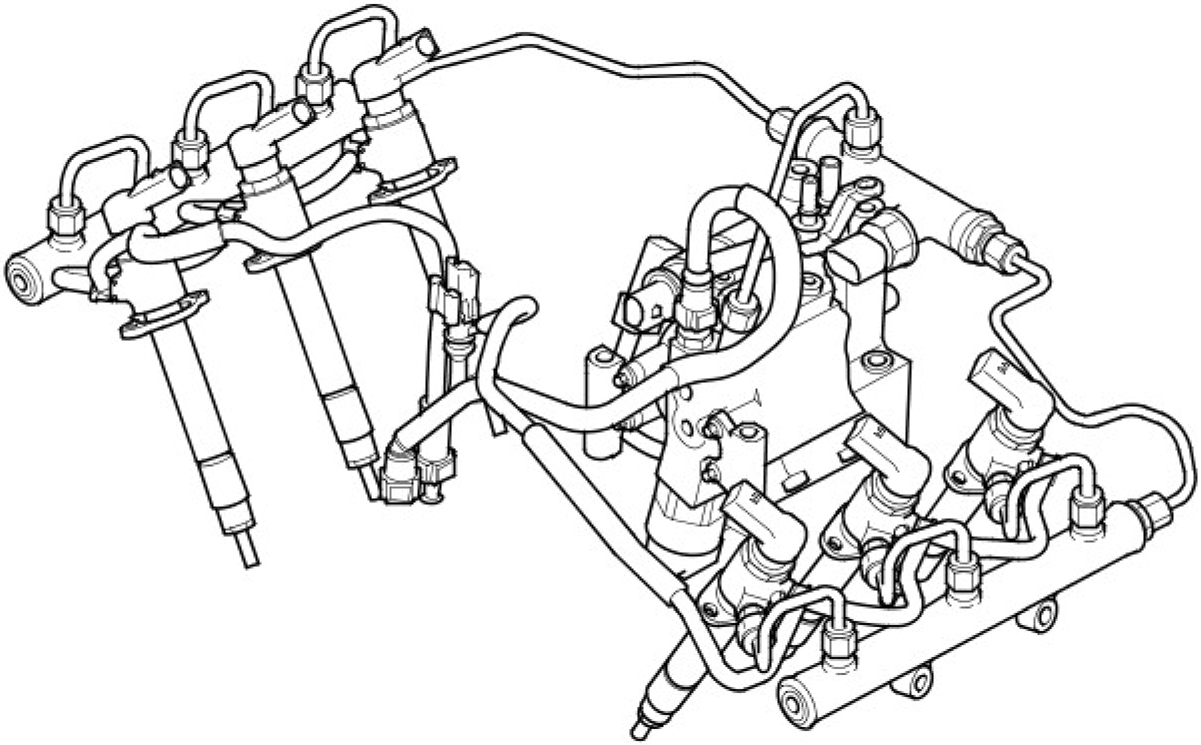
PCV Non-controlled (A)

The ball valve (3) will only be operated through the force exerted upon it by the spring (4). Thereby, the PCV is classed as open.

PCV Controlled (B)

The current flowing through the solenoid (6) draws the pin (7) down. This in turn transfers the magnetic force via the pin to the ball valve (3). The pull of the pin, and the pressure on the ball valve, is proportional to the valve flow (9).

HP Common Fuel Rails

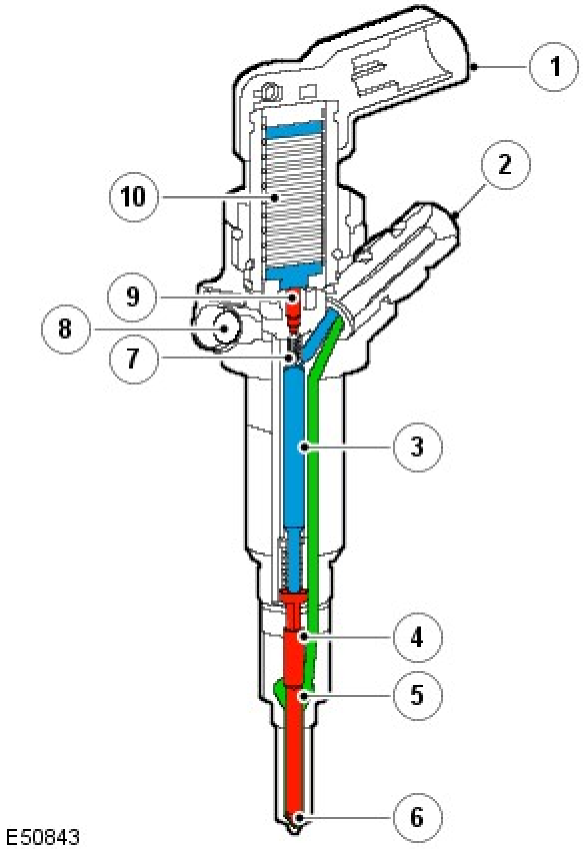


E50842

The fuel rails are manufactured from forged steel. They store the fuel at high pressure and prevent pressure fluctuations in the HP system.

All HP pipes have an internal diameter of 2.5mm except the pipes to the injectors, which are 3.0mm. Total rail volume is 33cc.

FUEL INJECTORS



Item	Part Number	Description
1	-	Harness connection
2	-	HP connection
3	-	Control piston
4	-	Nozzle needle
5	-	Nozzle HP chamber
6	-	Nozzle spray holes
7	-	Valve mushroom
8	-	Fuel return
9	-	Valve piston
10	-	Piezo actuator

The fuel injectors are operated directly by the ECM for fuel metering (start of injection and quantity of fuel injected).

The operating components of the piezo fuel injectors are:

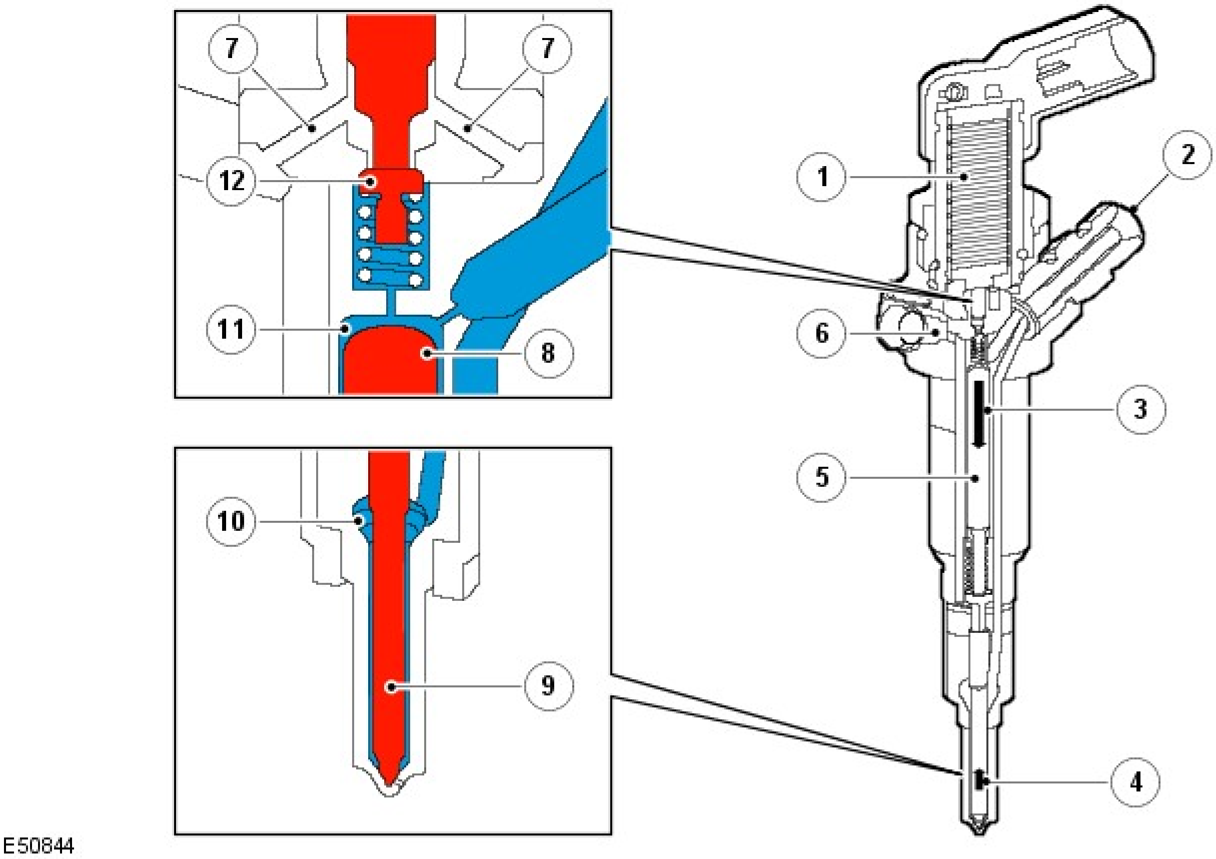
- The piezo actuator
- The injector body containing the hydraulic servo system
- The fuel injector nozzle

• NOTE: New injectors can be installed in any cylinder and DO NOT have to be configured.

• NOTE: Each injection event is controlled by a charge and discharge cycle allowing energy to dissipate in, and recover from, the injector. Never disconnect the wiring connector when the vehicle is running. The injector may remain open thus causing engine damage.

• NOTE: For safety reasons, the engine must be at standstill for 30 seconds before starting work on the HP fuel system.

Fuel Injector Not Actuated (Not Injecting Fuel)



Item	Part Number	Description
1	-	Piezo actuator
2	-	HP connection
3	-	Hydraulic force applied on control piston
4	-	Hydraulic force acting on tip of nozzle
5	-	Control piston
6	-	Fuel return
7	-	Fuel return
8	-	Control piston
9	-	Nozzle needle
10	-	High pressure chamber of nozzle
11	-	Control chamber
12	-	Valve mushroom

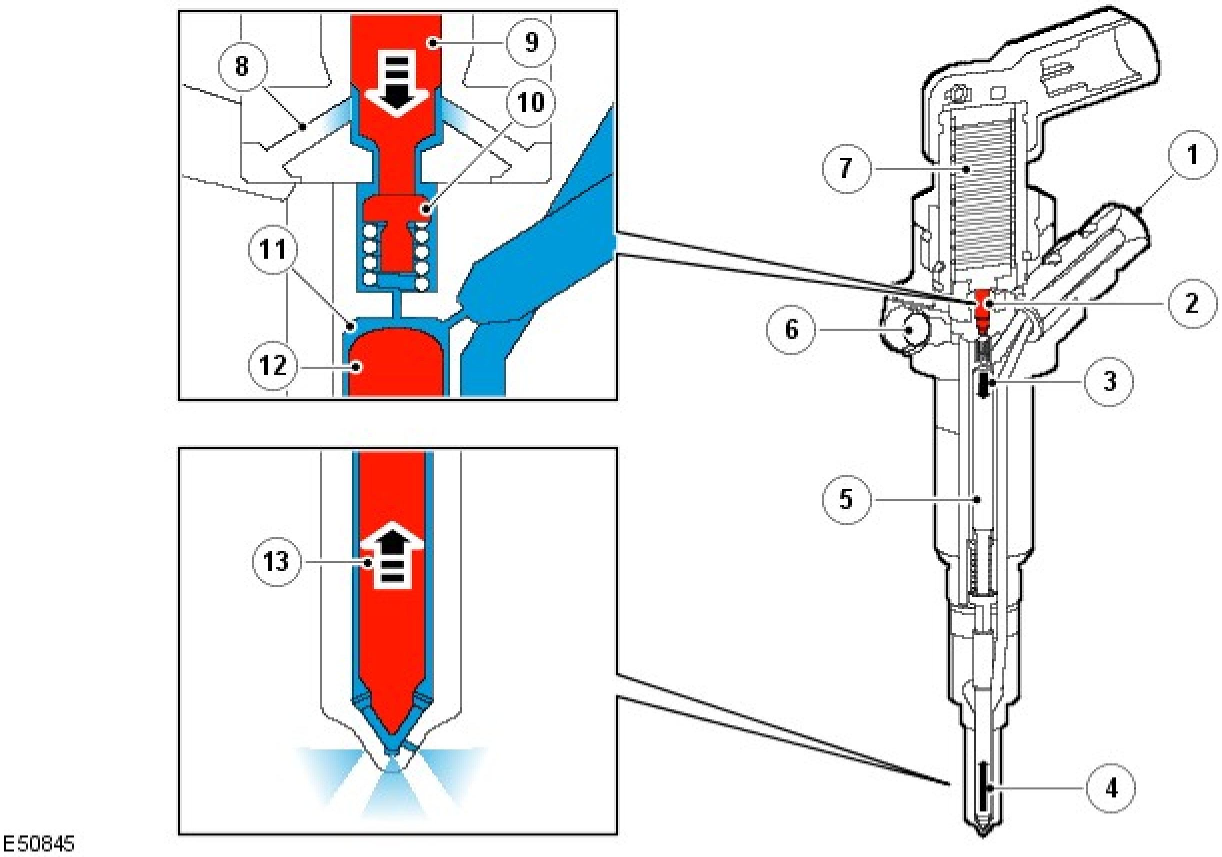
The HP fuel from the fuel-rail passes through the HP connection (2) into the control chamber (11) and into the HP chamber (10) of the fuel injector nozzle.

The piezo actuator (1) is currentless and the valve mushroom (12) closes the bore to the fuel return (7) by means of spring pressure.

There is however a continuous fuel return (6) to vent internal leakage within the injector.

The hydraulic force (3), which is now applied on the control piston by the fuel under high pressure in the control chamber (11) through the control piston (8), is greater than the hydraulic force (4) acting on the tip of the nozzle (since the area of the control piston in the control chamber is greater than the area of the tip of the nozzle).

Fuel Injector Actuated (Injecting Fuel)



Item	Part Number	Description
1	-	High pressure supply
2	-	Valve piston
3	-	Hydraulic force applied on control piston
4	-	Hydraulic force acting on tip of nozzle
5	-	Control piston
6	-	Fuel return
7	-	Piezo actuator
8	-	Fuel return
9	-	Valve piston
10	-	Valve mushroom
11	-	Control chamber
12	-	Control piston
13	-	Nozzle needle

The piezo actuator (7) energized by the ECM extends (charging phase) and presses on the valve piston (9). The valve mushroom (10) opens the bore, which connects the control chamber (11) to the fuel return (8 then 6).

As a result, the pressure in the control chamber drops, and the hydraulic force (4) acting on the tip of the nozzle needle is now greater than the force (3) acting on the control piston in the control chamber.

The nozzle needle (13) moves upwards and the fuel passes through the six spray holes into the combustion chamber.

Engine Starting

During starting, the fuel rail pressure must be at least 150 bar. Should the pressure be below this figure, the injectors will not operate, resulting in the vehicle not starting.

Engine Stopped

To stop the engine the ECM stops energising the piezo actuators, therefore, no fuel is injected and the engine speed drops to zero.

Fuel Charging and Controls - TDV6 2.7L Diesel - Fuel Charging and Controls

Diagnosis and Testing

Overview

Common rail diesel

The 2.7L fuel injection system is a common-rail design, running at the high-pressures of up to 1,600 bar (23,206 lb/in²) typical of such systems.

The fuel volume control valve (FVCV) regulates the amount of fuel supplied to the high-pressure side of the fuel injection pump, while the fuel pressure control valve (FPCV) regulates the pressure.

The high-pressure fuel is delivered to the fuel rail where it is stored, ready for use by the fuel injectors.

The fuel injectors are Piezo type, and are controlled by the engine control module (ECM) from inputs from the engine management sensors.

The fuel injectors operate in stages, giving a pilot injection before the main injection to reduce detonation noise and help improve the efficiency of the engine.

For additional information, refer to the workshop manual section 303-04 - Fuel Charging and Controls.

Inspection and Verification

- WARNINGS:

⚠ Do **NOT** carry out any work on the fuel system with the engine running. The fuel pressure within the system can be as high as 1600 bar (23,206 lb/in²). Failure to follow this instruction may result in personal injury.

⚠ Eye protection must be worn at all times when working on or near any fuel related components. Failure to follow this instruction may result in personal injury.

⚠ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow this instruction may result in personal injury.

⚠ After carrying out repairs, the fuel system must be checked visually for leaks. This should be done after the engine has been run, but with the engine switched **OFF**. Failure to follow this instruction may result in personal injury.

⚠ If taken internally, **DO NOT** induce vomiting. Seek immediate medical attention. Failure to follow this instruction may result in personal injury.

⚠ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. Failure to follow this instruction may result in personal injury.

⚠ Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention. Failure to follow this instruction may result in personal injury.

- CAUTIONS:

⚠ Before disconnecting any part of the system, it is imperative that all dust, dirt and debris is removed from around components to prevent ingress of foreign matter into the fuel system. Failure to follow this instruction may result in damage to the vehicle.

⚠ The fuel pipes between the injectors and the rail must be discarded after each use, and new pipes installed. Failure to follow this instruction may result in damage to the vehicle.

⚠ It is essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in damage to the vehicle.

⚠ Make sure that the workshop area in which the vehicle is being worked on is as clean and dust-free as possible. Areas in which work on clutches, brakes or where welding or machining are carried out are not suitable in view of the risk of contamination to the fuel system. Failure to follow this instruction may result in damage to the vehicle.

⚠ Make sure that any protective clothing worn is clean and made from lint-free non-flocking material. Failure to follow this instruction may result in damage to the vehicle.

⚠ Make sure that any protective gloves worn are new and are of the non-powdered latex type. Failure to follow this instruction may result in damage to the vehicle.

⚠ Make sure that clean, non-plated tools are used. Clean tools using a new brush that will not lose it's bristles and fresh cleaning fluid prior to starting work on the vehicle. Failure to follow this instruction may result in damage to the vehicle.

⚠ Use a steel-topped work bench and cover it with clean, lint-free, non-flocking material. Failure to follow this instruction may result in damage to the vehicle.

• NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to 3 decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.

P062D00	Fuel Injector Driver Circuit Performance Bank 1	● Injector(s) disconnected ● Injector circuit high resistance, short circuit to ground, short circuit to power ● Injector failure ● ECM failure	Refer to the electrical guides and check the injector circuits. Rectify as necessary. Clear the DTCs and test for normal operation. Refer to the relevant workshop manual section. Refer to the warranty policy and procedures manual if a module is suspect.
P062D01	Fuel Injector Driver Circuit Performance Bank 1	● Injector(s) short circuit ● Injector circuit high resistance, short circuit to ground, short circuit to power ● Injector failure ● ECM failure	If non start condition check for shorts on injector circuits. If rough running check for intermitent open circuits or high resistance on injector circuits. If no wiring faults are found, using approved diagnostic equipment perform injector spill tests. Follow actions recommended based on results from spill tests.

DTC	Condition	Possible causes	Action
P062E00	Fuel Injector Driver Circuit Performance Bank 2	● Injector(s) disconnected ● Injector circuit high resistance, short circuit to ground, short circuit to power ● Injector failure ● ECM failure	Refer to the electrical guides and check the injector circuits. Rectify as necessary. Clear the DTCs and test for normal operation. Refer to the relevant workshop manual section. Refer to the warranty policy and procedures manual if a module is suspect.
P062E01	Fuel Injector Driver Circuit Performance Bank 2	● Injector(s) short circuit ● Injector circuit high resistance, short circuit to ground, short circuit to power ● Injector failure ● ECM failure	If non start condition check for shorts on injector circuits. Follow actions recommended based on results from spill tests.
P120000	Injector Range/Performance	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Fuel injector leaking ● Fuel injector failure ● ECM failure	Refer to the electrical guides and check the injector circuits. Refer to the relevant workshop manual section. Refer to the warranty policy and procedures manual if a module is suspect.
P155100	Cylinder 1 Injector Circuit Range/Performance	● Injector disconnected ● Injector circuit high resistance, short circuit to ground, short circuit to power ● Injector failure	Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Refer to the relevant workshop manual section.
P155200	Cylinder 2 Injector Circuit Range/Performance	● Injector disconnected ● Injector circuit high resistance, short circuit to ground, short circuit to power ● Injector failure	Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Refer to the relevant workshop manual section.
P155300	Cylinder 3 Injector Circuit Range/Performance	● Injector disconnected ● Injector circuit high resistance, short circuit to ground, short circuit to power ● Injector failure	Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Refer to the relevant workshop manual section.
P155400	Cylinder 4 Injector Circuit Range/Performance	● Injector disconnected ● Injector circuit high resistance, short circuit to ground, short circuit to power ● Injector failure	Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Refer to the relevant workshop manual section.
P155400	Cylinder 5 Injector Circuit Range/Performance	● Injector disconnected ● Injector circuit high resistance, short circuit to ground, short circuit to power ● Injector failure	Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Refer to the relevant workshop manual section.
P155600	Cylinder 6 Injector Circuit Range/Performance	● Injector disconnected ● Injector circuit high resistance, short circuit to ground,	Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Refer to the relevant workshop manual section.

DTC	Condition	Possible causes	Action
		short circuit to power - Injector failure	
P156300	Injection Pump Control Module Requesting Engine Stop	- Internal control module monitoring performance	Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P226900	Water in Fuel Condition	- Water in fuel condition - Water in fuel sensor circuit short circuit to ground - Water in fuel sensor fault	Drain the water from the fuel filter. Clear the DTC and retest. If the DTC resets, check the sensor circuit. Refer to the electrical guides. If no fault is found in the circuits, install a new sensor.
P228800	Injector Control Pressure Too High	- Fuel pressure control valve (FPCV) minimum limit reached - Fuel injector control pressure too high - FPCV circuit fault - FPCV failure - Fuel pump module circuit short circuit to power - Fuel pump module failure - Fuel injection pump failure	Check the fuel pressure, refer to the relevant section of the workshop manual. Check the fuel pump module circuits and the FPCV circuits. Refer to the electrical guides. For FPCV and fuel injection pump, refer to the relevant workshop manual section.
P229000	Injector Control Pressure Too Low	- Fuel pressure control valve (FPCV) maximum limit reached - Fuel injector control pressure too low - Fuel line leak - Fuel filter/system restriction - FPCV circuit fault - FPCV failure - Fuel pump module circuit short circuit to ground - Fuel pump module failure - Fuel injection pump failure	Check the fuel pressure, refer to the relevant section of the workshop manual. Check the fuel pump module circuits and the FPCV circuits. Refer to the electrical guides. For FPCV and fuel injection pump, refer to the relevant workshop manual section.
P229200	Injector Control Pressure Erratic	- Fuel injector control pressure erratic - FPCV circuit fault - FPCV failure - Fuel pump module circuit high resistance, short circuit to ground, short circuit to power - Fuel pump module failure - Fuel injection pump failure	Check the fuel pressure, refer to the relevant section of the workshop manual. Check the fuel pump module circuits and the FPCV circuits. Refer to the electrical guides. For FPCV and fuel injection pump, refer to the relevant workshop manual section.

Removal and Installation

Special Tool(s)	
	Fuel Injector remover 303-1127

Removal

- WARNINGS:

⚠ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

⚠ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠ Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

- CAUTIONS:

⚠ Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

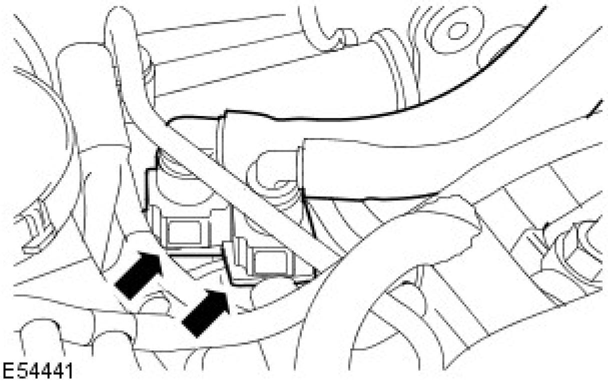
⚠ Do not disconnect the fuel injector electrical connectors with the engine running. Failure to follow this instruction may result in serious damage to the engine.

⚠ Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠ Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠ Do not disassemble the fuel injectors or clean the nozzles, even with an ultrasonic cleaner. Always install new fuel injectors when required.

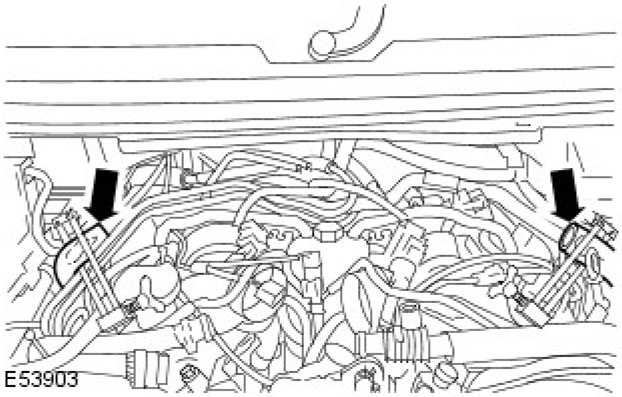
1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
   For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).



E54441

3. Disconnect the low-pressure fuel lines.

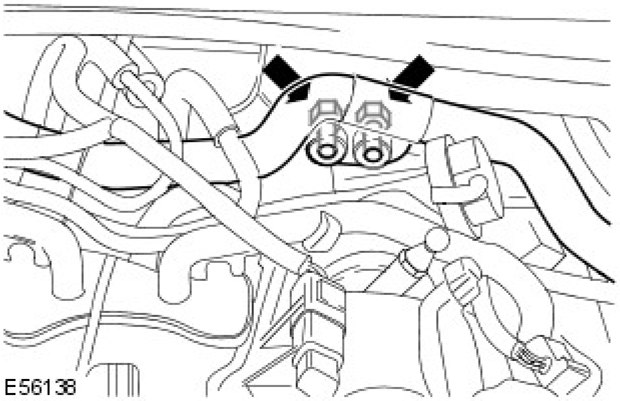
- Install blanking caps to the exposed ports.



E53903

4. Disconnect both exhaust gas recirculation (EGR) coolant cross-over pipe hoses.

- Clamp the EGR coolant hoses to minimize coolant loss.

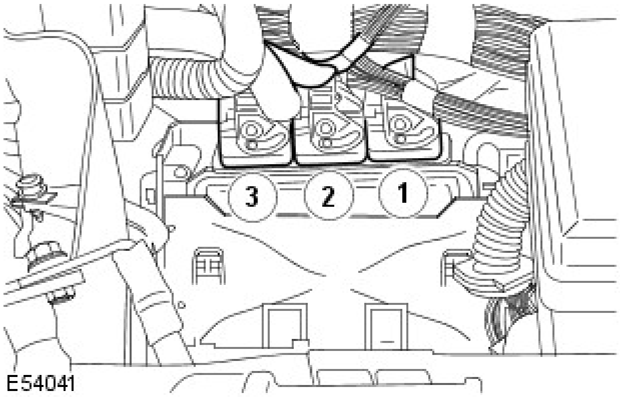


E56138

5. Remove the EGR coolant cross-over pipe.

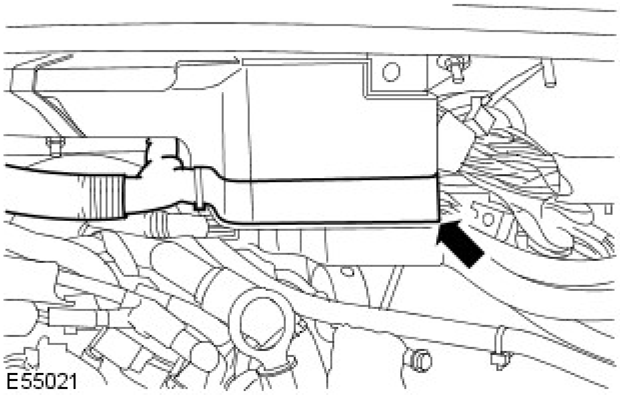
- Remove the two retaining bolts.

6. Remove the battery.
For additional information, refer to: Battery (414-01 Battery, Mounting and Cables, Removal and Installation).

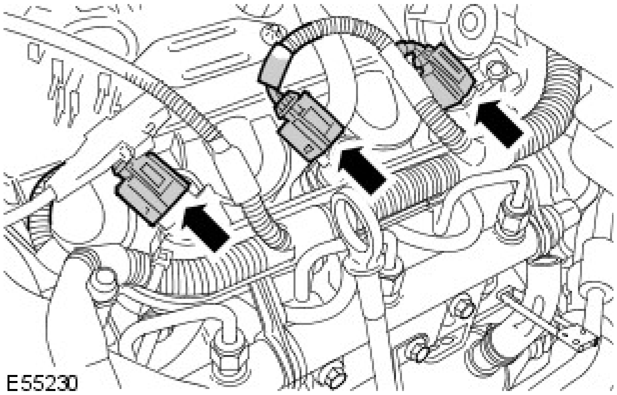


7. NOTE: Right hand drive shown, for Left hand drive reverse the sequence.

Disconnect the three engine harness electrical connectors in the order shown.

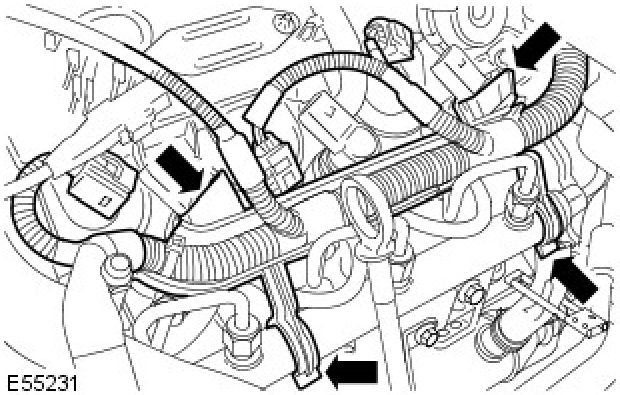


8. Release the engine wiring harness from the bulkhead.



9. Remove the injector sound proofing.

10. Disconnect the fuel injector electrical connectors.



11. Release the engine wiring harness.

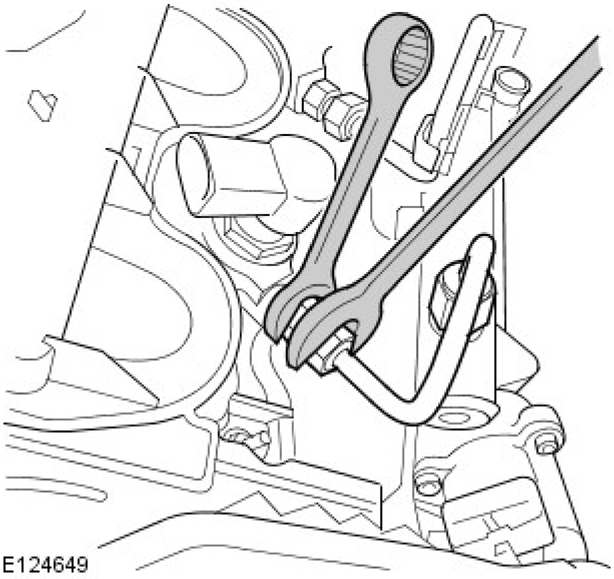
- Release the 4 clips.

12. CAUTIONS:

⚠ Make sure that the high-pressure fuel supply line remains in contact with the fuel pump and fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠ Do not use any aggressive cleaning fluid or a wire brush to clean the fuel injector nozzle.

Using the pneumatic vacuum gun, vacuum foreign material from the high-pressure fuel supply line, the fuel injector and the fuel injection supply manifold.
For additional information, refer to: Fuel Injection Component Cleaning (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, General Procedures).

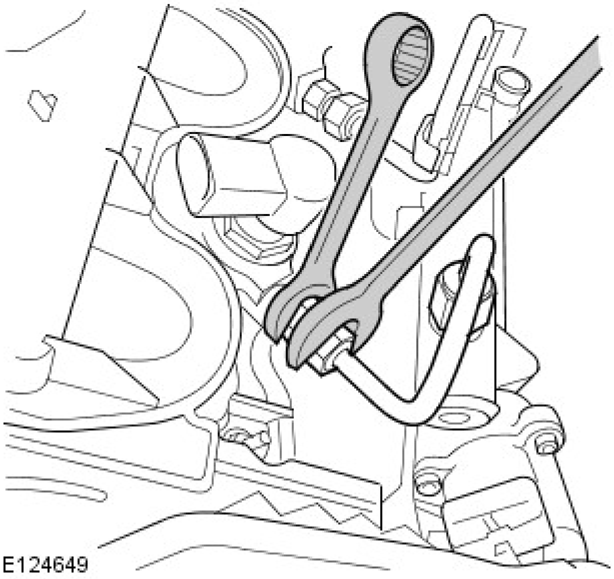


13. CAUTIONS:

⚠ Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠ Make sure that the fuel injector adaptor union does not move when loosening the high-pressure fuel supply lines. Failure to follow this instruction may result in damage to the fuel injector or the fuel injector adaptor union.

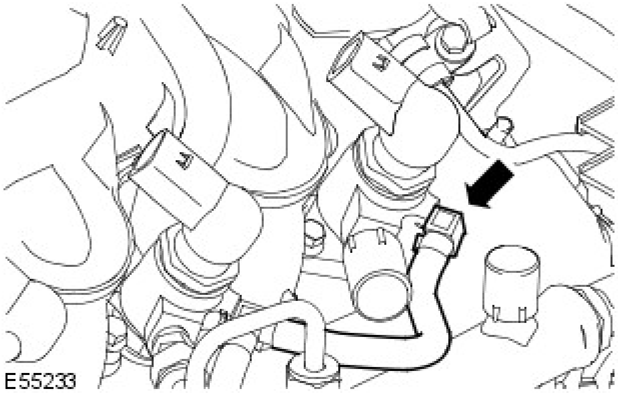
Loosen the high-pressure fuel supply line from the fuel injector and fuel rail.



14. ⚠CAUTION: Make sure that all openings are sealed. Use new blanking caps.

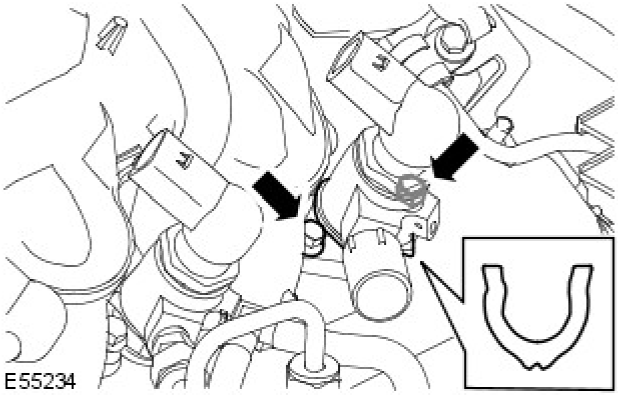
- NOTE: Right-hand shown, left-hand similar.

Remove and discard the high-pressure fuel supply line.



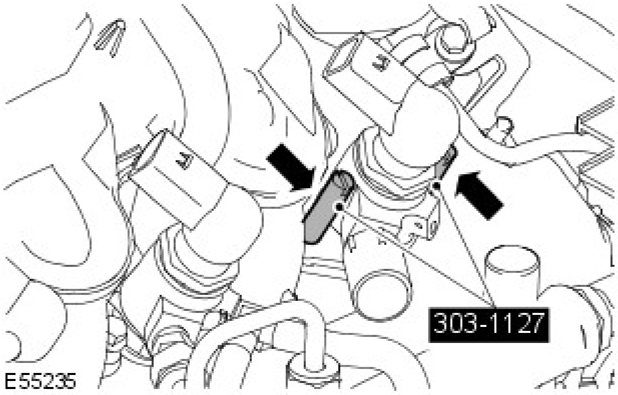
15. Disconnect the fuel return line from the fuel injector.

- Remove and discard the fuel return line retaining clip.

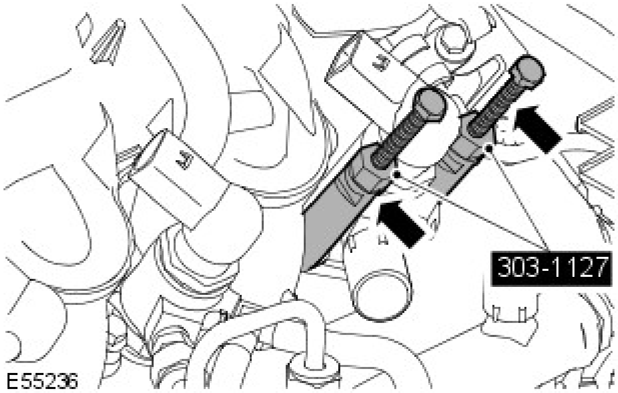


16. Remove the two fuel injector retaining bolts.

- Remove the fuel injector retaining clamp spacer.

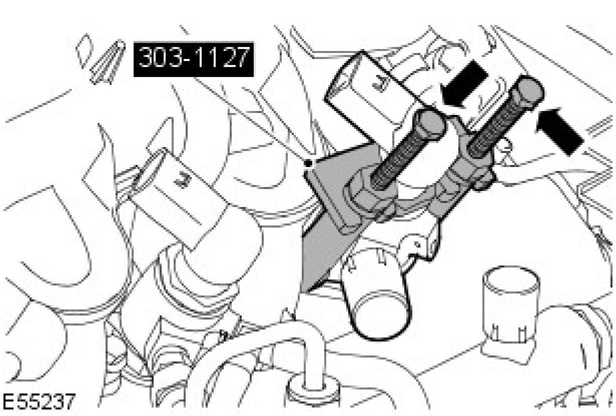


17. Install the special tool studs.



18. ⚠CAUTION: Make sure the fuel injector remover legs are correctly engaged to the fuel injector. Failure to follow this instruction may result in damage to the component.

Install the special tool remover legs to the studs.

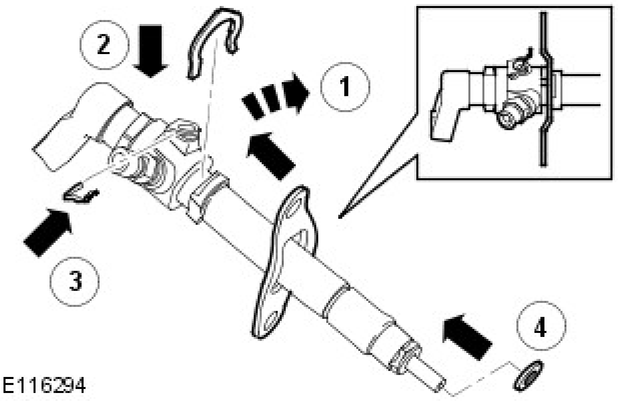


19. ⚠ CAUTION: Make sure the fuel injector remover legs are correctly engaged to the fuel injector. Failure to follow this instruction may result in damage to the component.

Remove the fuel injector.

- Rotate the special tool bolts evenly, in a clockwise direction.
- Remove the special tool.
- Remove and discard the fuel injector retaining clamp.
- Remove and discard the sealing washer.

Installation



1. CAUTIONS:

⚠ Do not disassemble the fuel injectors or clean the nozzles, even with an ultrasonic cleaner. Always install new fuel injectors when required.

⚠ Do not use tools to install the new fuel return line clip. Failure to follow this instruction will result in damage to the retaining clip.

Install a new fuel injector retaining clamp.

1. Install a new fuel injector retaining clamp.
2. Install the fuel injector retaining clamp spacer.
3. Install a new fuel return line retaining clip.
4. Install a new sealing washer.

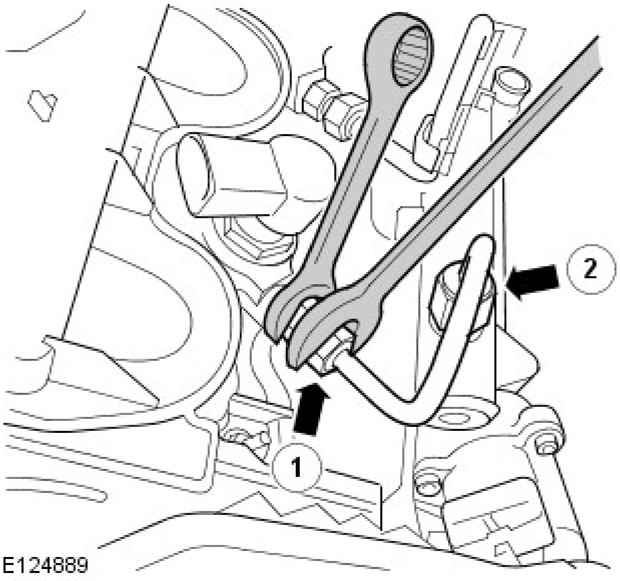
2. Install the fuel injector.

- Install the two bolts and tighten to 10 Nm (7 lb.ft).

3. ⚠ CAUTION: Make sure the fuel return line retaining clip is correctly installed to the fuel injector before installing the return line.

Connect the fuel return line to the fuel injector.

- Visually inspect the fuel return line O-ring seals for damage.
- Apply a light coating of petroleum jelly to the fuel return line O-ring seals.



4. CAUTIONS:

⚠ Do not allow the unions to hit the olive ends of the high-pressure fuel supply line as this may damage the ends of the line and allow foreign matter to enter the fuel injection system.

⚠ Maintain pressure on the high-pressure fuel supply lines to keep the olives in contact with the fuel rail and the fuel injector cones while installing unions.

• NOTE: Remove and discard the blanking caps.

Install the new high-pressure fuel supply lines.

- Install the new high-pressure fuel supply line, tighten the fuel supply line unions finger tight.
- Tighten the high-pressure fuel supply line in the shown sequence.
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 15 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 15 Nm.
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 35 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 35 Nm.

5. Attach the engine wiring harness.

6. Connect the fuel injector electrical connectors.

7. Install the injector sound proofing.

8. Attach the engine wiring harness to the bulkhead.

9. Connect the three engine harness electrical connectors.

10. Install the battery.
For additional information, refer to: Battery (414-01 Battery, Mounting and Cables, Removal and Installation).

11. Install the EGR coolant cross-over pipe.

- Install the two retaining bolts.
- Tighten the bolts to 13 Nm (10 lb.ft).

12. Connect both EGR coolant cross-over pipe hoses.

- Remove the EGR coolant hose clamps.

13. Connect the low-pressure fuel lines.

- Remove the blanking caps from the ports.

14. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

15. Check and top-up the coolant.

16. Bleed the fuel system.

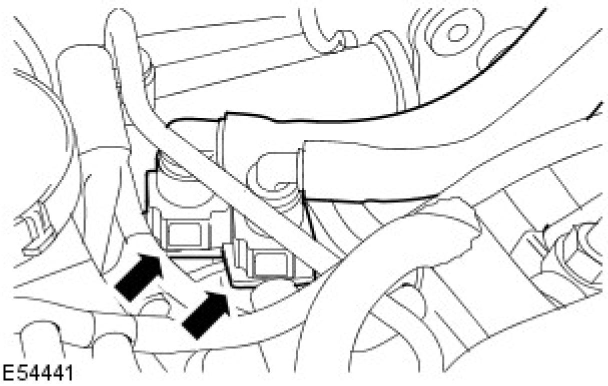
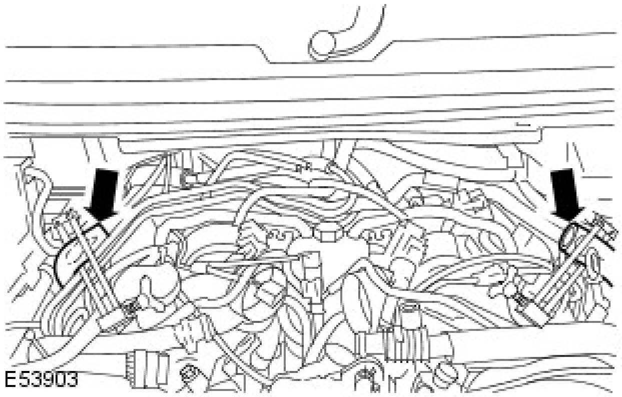
   For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).



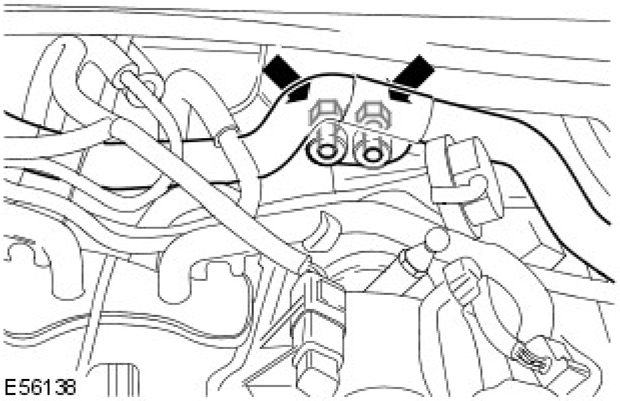
3. Disconnect the low-pressure fuel lines.

- Install blanking caps to the exposed ports.



4. Disconnect both exhaust gas recirculation (EGR) coolant cross-over pipe hoses.

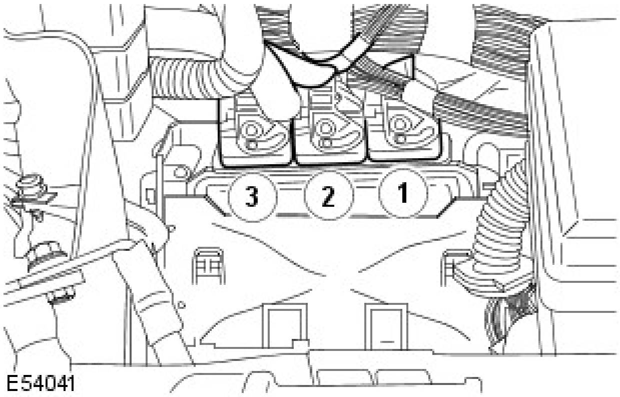
- Clamp the EGR coolant hoses to minimize coolant loss.



5. Remove the EGR coolant cross-over pipe.

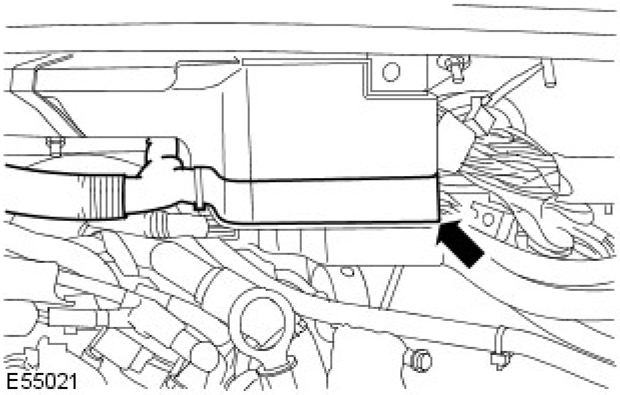
- Remove the two retaining bolts.

6. Remove the battery.
For additional information, refer to: Battery (414-01 Battery, Mounting and Cables, Removal and Installation).

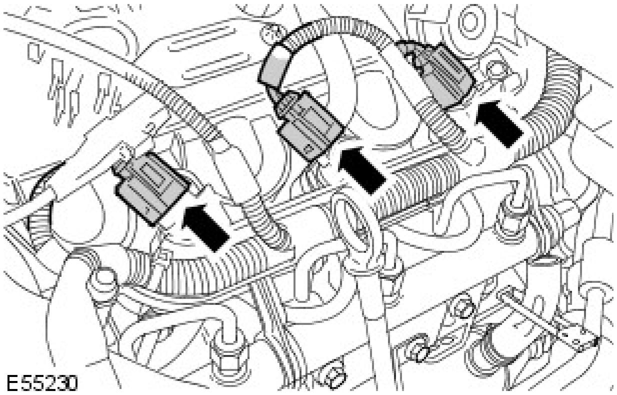


7. NOTE: Right hand drive shown, for Left hand drive reverse the sequence.

Disconnect the three engine harness electrical connectors in the order shown.

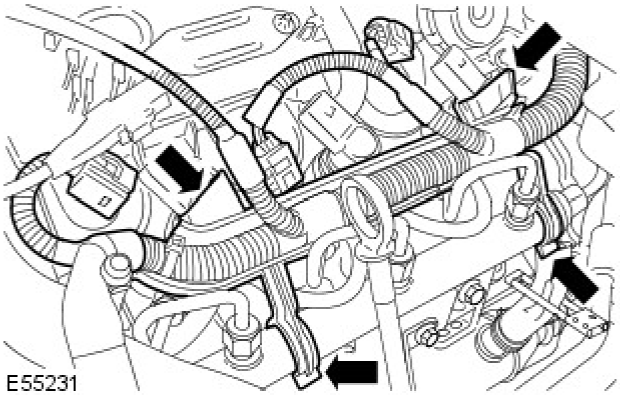


8. Release the engine wiring harness from the bulkhead.



9. Remove the NVH pads from each cylinder bank.

10. Disconnect the fuel injector electrical connectors.



11. Release the engine wiring harness.

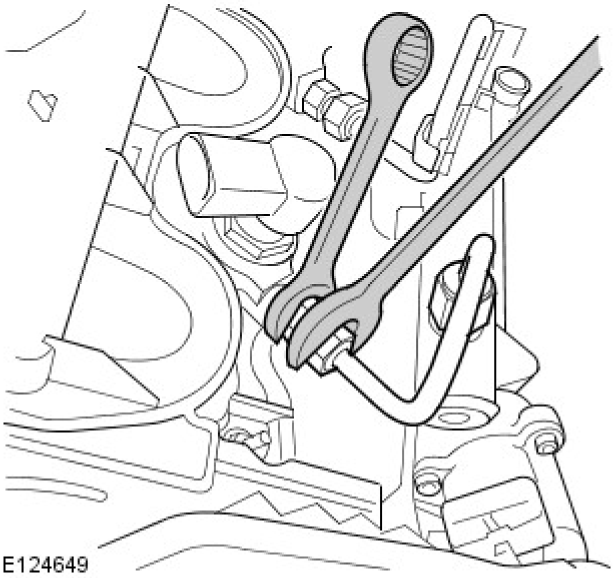
- Release the 4 clips.

12. CAUTIONS:

⚠ Make sure that the high-pressure fuel supply line remains in contact with the fuel pump and fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠ Do not use any aggressive cleaning fluid or a wire brush to clean the fuel injector nozzle.

Using the pneumatic vacuum gun, vacuum foreign material from the high-pressure fuel supply line, the fuel injector and the fuel injection supply manifold.

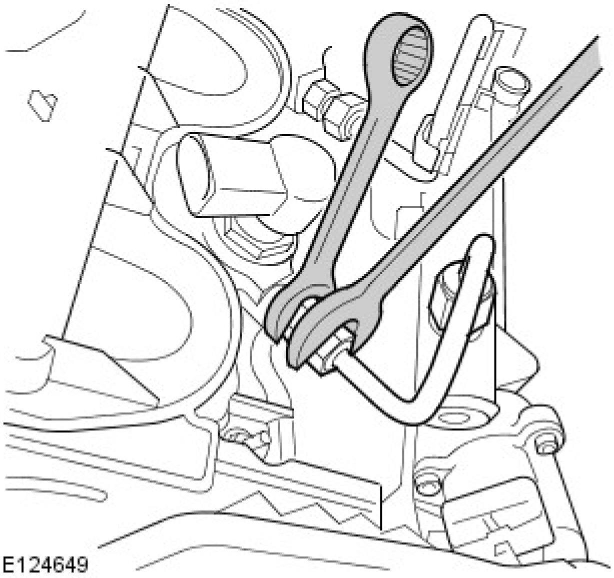


13. CAUTIONS:

⚠ Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠ Make sure that the fuel injector adaptor union does not move when loosening the high-pressure fuel supply lines. Failure to follow this instruction may result in damage to the fuel injector or the fuel injector adaptor union.

Loosen the high-pressure fuel supply line from the fuel injector and fuel rail.



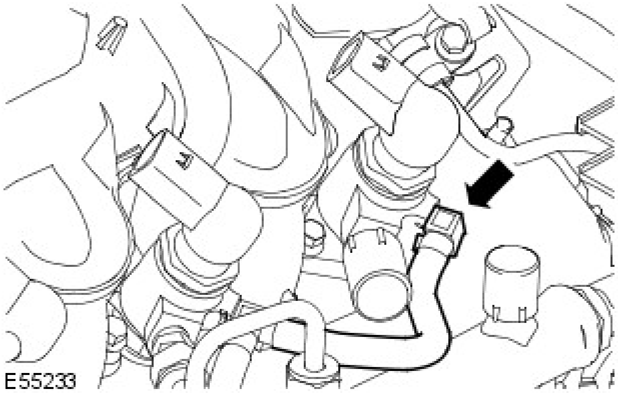
14. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

- NOTE: Right-hand shown, left-hand similar.

Remove and discard the high-pressure fuel supply line.

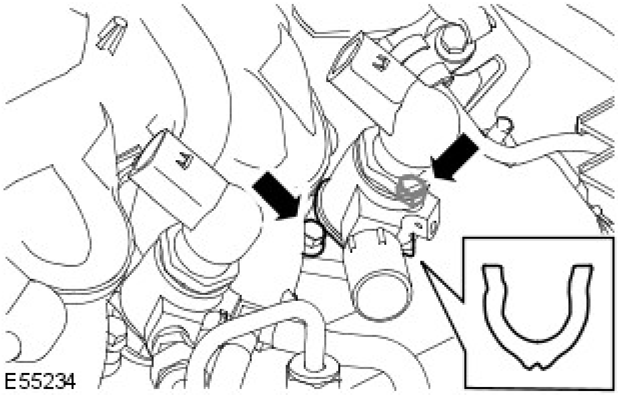
15. Disconnect the fuel return line from the fuel injector.

- Remove and discard the fuel return line retaining clip.

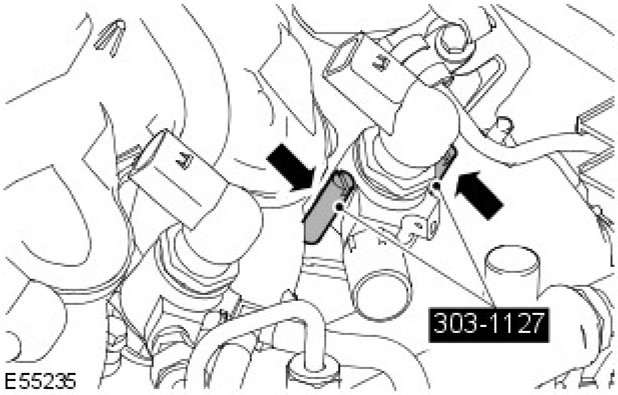


16. Remove the two fuel injector retaining bolts.

- Remove the fuel injector retaining clamp spacer.

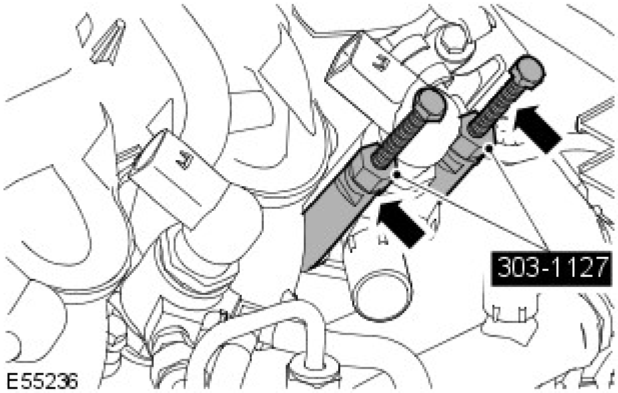


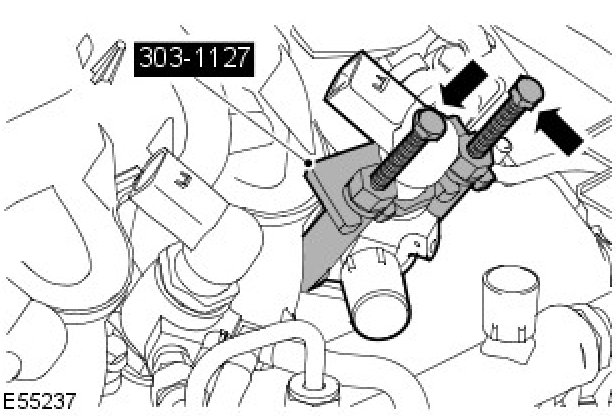
17. Install the special tool studs.



18. ⚠ CAUTION: Make sure the fuel injector remover legs are correctly engaged to the fuel injector. Failure to follow this instruction may result in damage to the component.

Install the special tool remover legs to the studs.



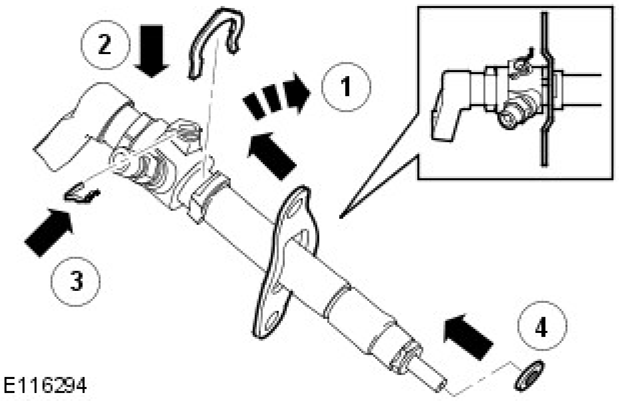


19. ⚠ CAUTION: Make sure the fuel injector remover legs are correctly engaged to the fuel injector. Failure to follow this instruction may result in damage to the component.

Remove the fuel injector.

- Rotate the special tool bolts evenly, in a clockwise direction.
- Remove the special tool.
- Remove and discard the fuel injector retaining clamp.
- Remove and discard the sealing washer.

Installation



1. CAUTIONS:

⚠ Do not disassemble the fuel injectors or clean the nozzles, even with an ultrasonic cleaner. Always install new fuel injectors when required.

⚠ Do not use tools to install the new fuel return line clip. Failure to follow this instruction will result in damage to the retaining clip.

Install a new fuel injector retaining clamp.

1. Install a new fuel injector retaining clamp.
2. Install the fuel injector retaining clamp spacer.
3. Install a new fuel return line retaining clip.
4. Install a new sealing washer.

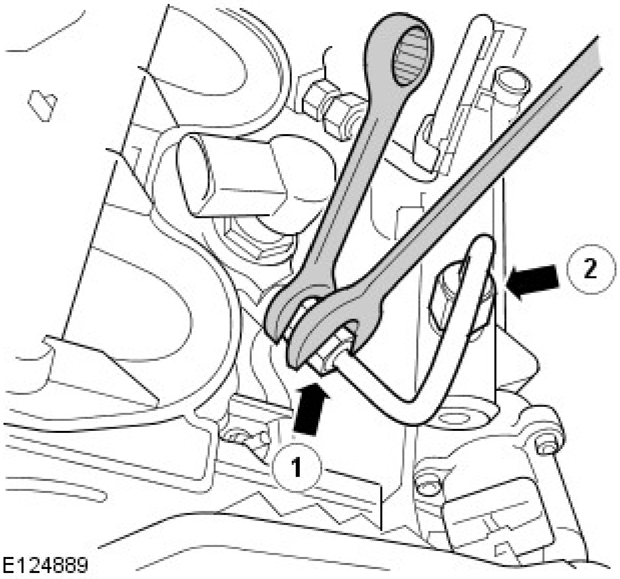
2. Install the fuel injector.

- Install the two bolts and tighten to 10 Nm (7 lb.ft).

3. ⚠ CAUTION: Make sure the fuel return line retaining clip is correctly installed to the fuel injector before installing the return line.

Connect the fuel return line to the fuel injector.

- Visually inspect the fuel return line O-ring seals for damage.
- Apply a light coating of petroleum jelly to the fuel return line O-ring seals.



4. CAUTIONS:

⚠ Do not allow the unions to hit the olive ends of the high-pressure fuel supply line as this may damage the ends of the line and allow foreign matter to enter the fuel injection system.

⚠ Maintain pressure on the high-pressure fuel supply lines to keep the olives in contact with the fuel rail and the fuel injector cones while installing unions.

• NOTE: Remove and discard the blanking caps.

Install the new high-pressure fuel supply lines.

- Install the new high-pressure fuel supply line, tighten the fuel supply line unions finger tight.
- Tighten the high-pressure fuel supply line in the shown sequence.
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 15 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 15 Nm.
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 35 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 35 Nm.

5. Attach the engine wiring harness.

6. Connect the fuel injector electrical connectors.

7. Install the NVH pads on the cylinder banks.

8. Attach the engine wiring harness to the bulkhead.

9. Connect the three engine harness electrical connectors.

10. Install the battery.
For additional information, refer to: Battery (414-01 Battery, Mounting and Cables, Removal and Installation).

11. Install the EGR coolant cross-over pipe.

- Install the two retaining bolts.
- Tighten the bolts to 13 Nm (10 lb.ft).

12. Connect both EGR coolant cross-over pipe hoses.

- Remove the EGR coolant hose clamps.

13. Connect the low-pressure fuel lines.

- Remove the blanking caps from the ports.

14. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

15. Check and top-up the coolant.

16. Bleed the fuel system.

- WARNINGS:

⚠ Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

⚠ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠ Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

- CAUTIONS:

⚠ Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

⚠ Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠ Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠ Do not remove the fuel rail pressure sensor from the fuel injection diverter rail.

- NOTE: If a new fuel rail pressure sensor is to be installed, a new fuel injection diverter rail and fuel rail pressure sensor must be installed as an assembly.

1. Disconnect the battery ground cable.

GENERAL

The TDV8 engine is equipped with a high-pressure common rail fuel injection system. With this fuel injection process, a high-pressure fuel pump delivers a uniform level of pressure to the shared fuel lines (the common rails), which serve all 8 fuel injectors. Pressure is controllable, to the optimum level for smooth operation, up to 1750 bar.

The common rail system supports a pre-injection (pilot) phase, which reduces combustion noise and mechanical load.

Fuel injection pressure is generated independently of engine speed and fuel injection events.

The fuel injection timing and volume are calculated by the Engine Control Module (ECM), which then energizes the appropriate piezo actuated injector.

The common rail fuel injection system has the following features:

- High fuel injection pressures of up to 1750 bar for greater atomisation of fuel (increasing performance and lowering emissions)
- Variable injection to optimize combustion in all engine operating conditions
- Low tolerances and high precision throughout the life of the system

The fuel system is divided into 2 sub systems:

- Low-pressure system
- High-pressure system

The low-pressure system features the following components:

- In-tank fuel pump
- Fuel pressure regulator (integral to the fuel delivery module)
- Fuel filter
- Return pipes and fuel cooler
- Injector return pipes
- Fuel coolers (engine and vehicle)

The low-pressure system pressure is regulated to 0.5 bar.

The high-pressure system features the following components:

- High-pressure fuel pump
- Common fuel rails and diverter rail
- High-pressure fuel pipes
- Injectors

LOW-PRESSURE SYSTEM

In-tank Fuel Pump

The electric fuel pump is located inside the fuel tank. Fuel is pumped from the tank via the in-tank fuel pump, to the high-pressure fuel pump via the fuel filter.
For additional information, refer to: Fuel Tank and Lines (310-01D Fuel Tank and Lines - TDV8 3.6L Diesel, Description and Operation).

Fuel Filter

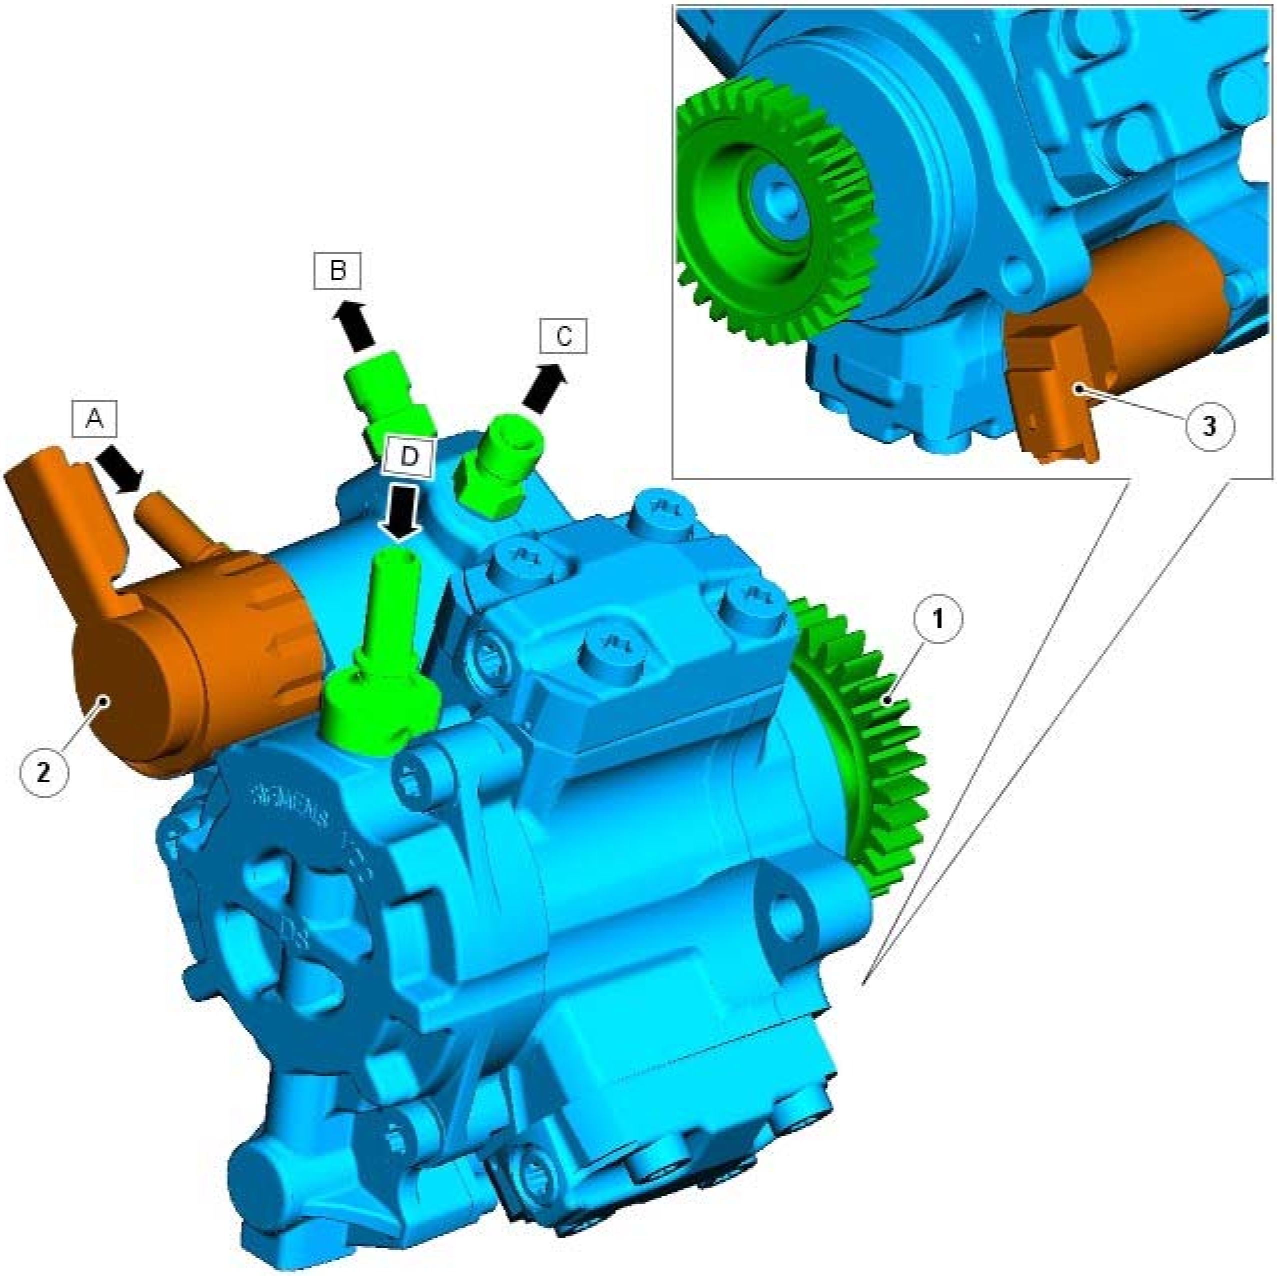
The fuel filter is located in the engine compartment on the left hand side, packaged to be protected against damage. Incorporated in the fuel filter housing is a bimetallic temperature valve, which will start to close at 30°C (86°F) and will fully close at 50°C (122°F). This allows pre-heated diesel fuel to circulate inside the fuel filter to prevent waxing in cold operating conditions.

Fuel Cooler

Two fuel coolers are fitted to the vehicle. One is located in the 'vee' of the engine block, and has a coolant system connection to aid heat transfer. The second cooler is located in the fuel return line and is a fuel to air cooler.
For additional information, refer to: Fuel Tank and Lines (310-01D Fuel Tank and Lines - TDV8 3.6L Diesel, Description and Operation).

HIGH-PRESSURE SYSTEM

High-Pressure Fuel Pump



E81897

Item	Part Number	Description
A	-	Fuel return
B	-	Fuel supply - high-pressure fuel pump to RH fuel rail
C	-	Fuel supply - high-pressure fuel pump to LH fuel rail
D	-	Fuel supply
1	-	High-pressure fuel pump drive gear
2	-	Pressure control valve

The high-pressure fuel pump is a three-piston (120 degree apart) radial plunger pump with a high-pressure displacement of 0.8 cc. As mentioned, it has the ability to produce a maximum pressure of 1750 bar.

The pump is driven from the LH inlet camshaft via a drive gear and does not need to be timed to the engine.

The required supply pressure to the pump is -0.3 bar to +0.5 bar gauge. The return pressure is -0.3 bar to +0.8 bar gauge.

The pump is sized to deliver sufficient fuel to the high-pressure rails for all engine-operating conditions.

The high-pressure fuel pump consists of the following components:

- Internal Transfer Pump (ITP)
- Volume Control Valve (VCV)

- HP pumping elements (3 of)
- Pressure Control Valve (PCV)

The ITP is a 5 vane pump. This conveys fuel to the VCV.

The VCV is a variable position solenoid valve electronically controlled by the ECM. The VCV is located between the ITP and the high-pressure pumping elements. The VCV determines the amount of fuel that is delivered to the high-pressure pumping elements. When there is no signal to the VCV the valve is closed, therefore no fuel delivery.

The 3 high-pressure pumping elements are connected together in a fuel ring circuit within the pump. There is a single high-pressure outlet connection for the high-pressure pipe to the high-pressure diverter rail.

The PCV is a variable position solenoid valve electronically controlled by the ECM. The PCV is located between the high-pressure pumping elements and the high-pressure outlet connection. The PCV regulates the amount of fuel pressure in the fuel rails and is controlled by the ECM. When there is no signal to the PCV the valve is open, therefore no rail pressure can be generated.

10	-	Pumping element outlet valve
11	-	High-pressure ring line
12	-	High-pressure fuel pump elements (3 of)
13	-	Lubricating valve

The fuel induced by the ITP (5) is conveyed to the VCV (4) and the lubricating valve (13).

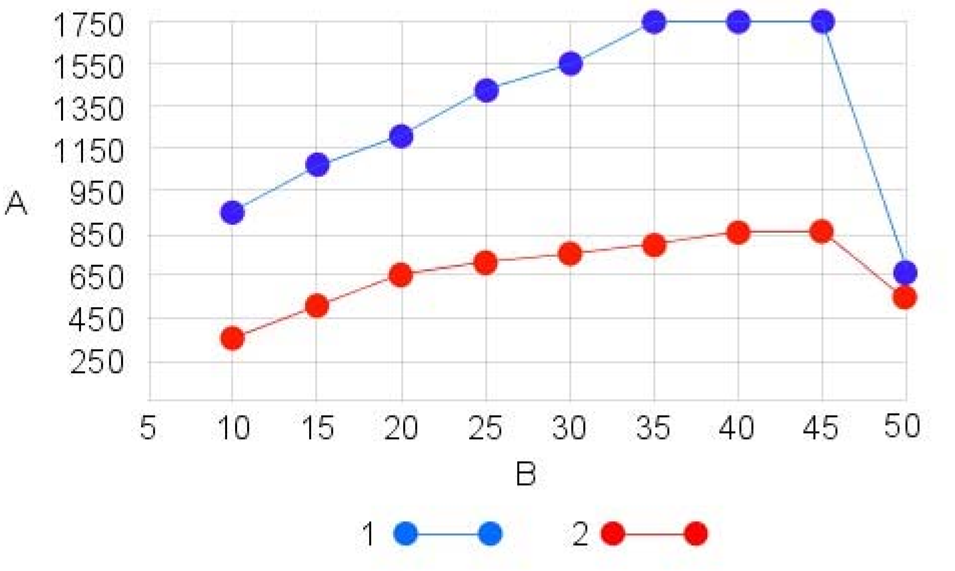
When the VCV is closed, the ITP pressure relief valve (2), lying parallel to the transfer pump, opens and conveys the fuel back to the low-pressure side (1) of the transfer pump.

The fuel passes through the lubricating valve (13) into the interior of the high-pressure fuel pump and from there to the fuel return (D). The fuel is used to lubricate the pump.

The VCV (4) determines the quantity of fuel (B) that is supplied to the pumping elements (12).

The fuel from the high-pressure outlets (10) of the 3 pumping elements comes together in a ring line (11) and is conveyed through the high-pressure outlet of the high-pressure fuel pump to the rails.

The PCV (7) regulates the fuel pressure in the fuel rails. Reducing rail pressure via the PCV results in fuel from the rail returning to the low-pressure fuel return (D).



E81899

Item	Part Number	Description
A	-	Injection pressure (bar)
B	-	Engine r/min x 100
1	-	High-boost fuel pressure
2	-	Low-boost fuel pressure

The high-pressure fuel pump can supply up to 1700 bar fuel pressure continuously with short excursions to 1750 bar. Pump speed is 5/6 engine speed. However it is calibrated to deliver fuel pressure dependant upon engine speed and load and is always under full control.

When the high-pressure fuel pump is rotated, pressure is created when the VCV is open and the PCV is closed. The VCV and PCV are variable position to allow variable fuel delivery and pressure control.

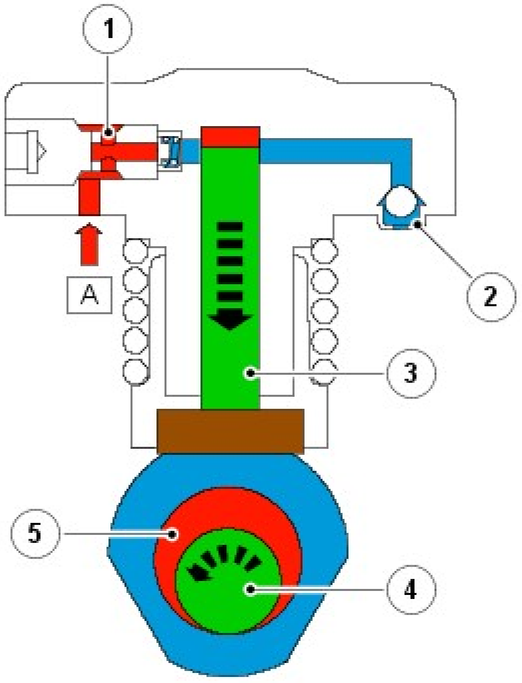
When the ECM actuates the piezo injectors, the rail pressure drop is off-set by additional fuel being delivered to the high-pressure rails by the PCV.

Pressure Reduction After Engine Has Stopped

The fuel pressure in the system is reduced within a few seconds after the engine has stopped as the PCV no longer has the holding current it requires, and therefore opens. No residual pressure remains in the system and the fuel is returned to the fuel return line (D) through the open PCV. The system is pressureless.

Function of a High Pressure Element

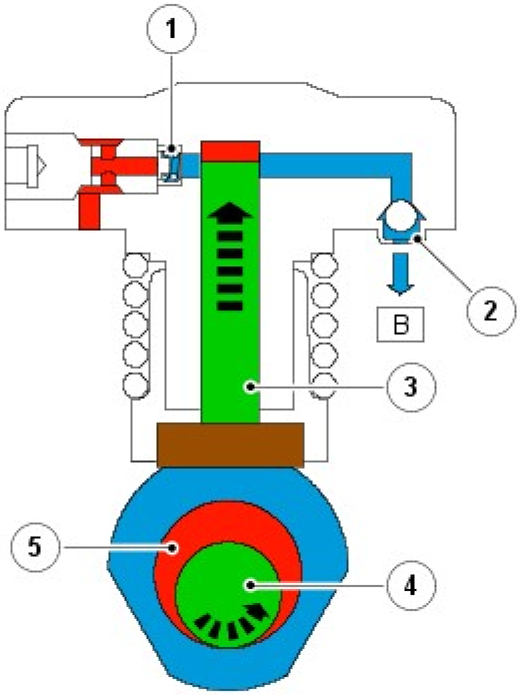
Fuel Induction



E50836

During the downward motion of the piston (3), a vacuum in the pump cylinder is generated, which opens the inlet valve (1) against the force exerted by the valve spring. The fuel (A), which is flowing past the VCV, is sucked in. At the same time the outlet valve (2) is closed due to the pressure difference between the pump cylinder and the high-pressure fuel in the ring line.

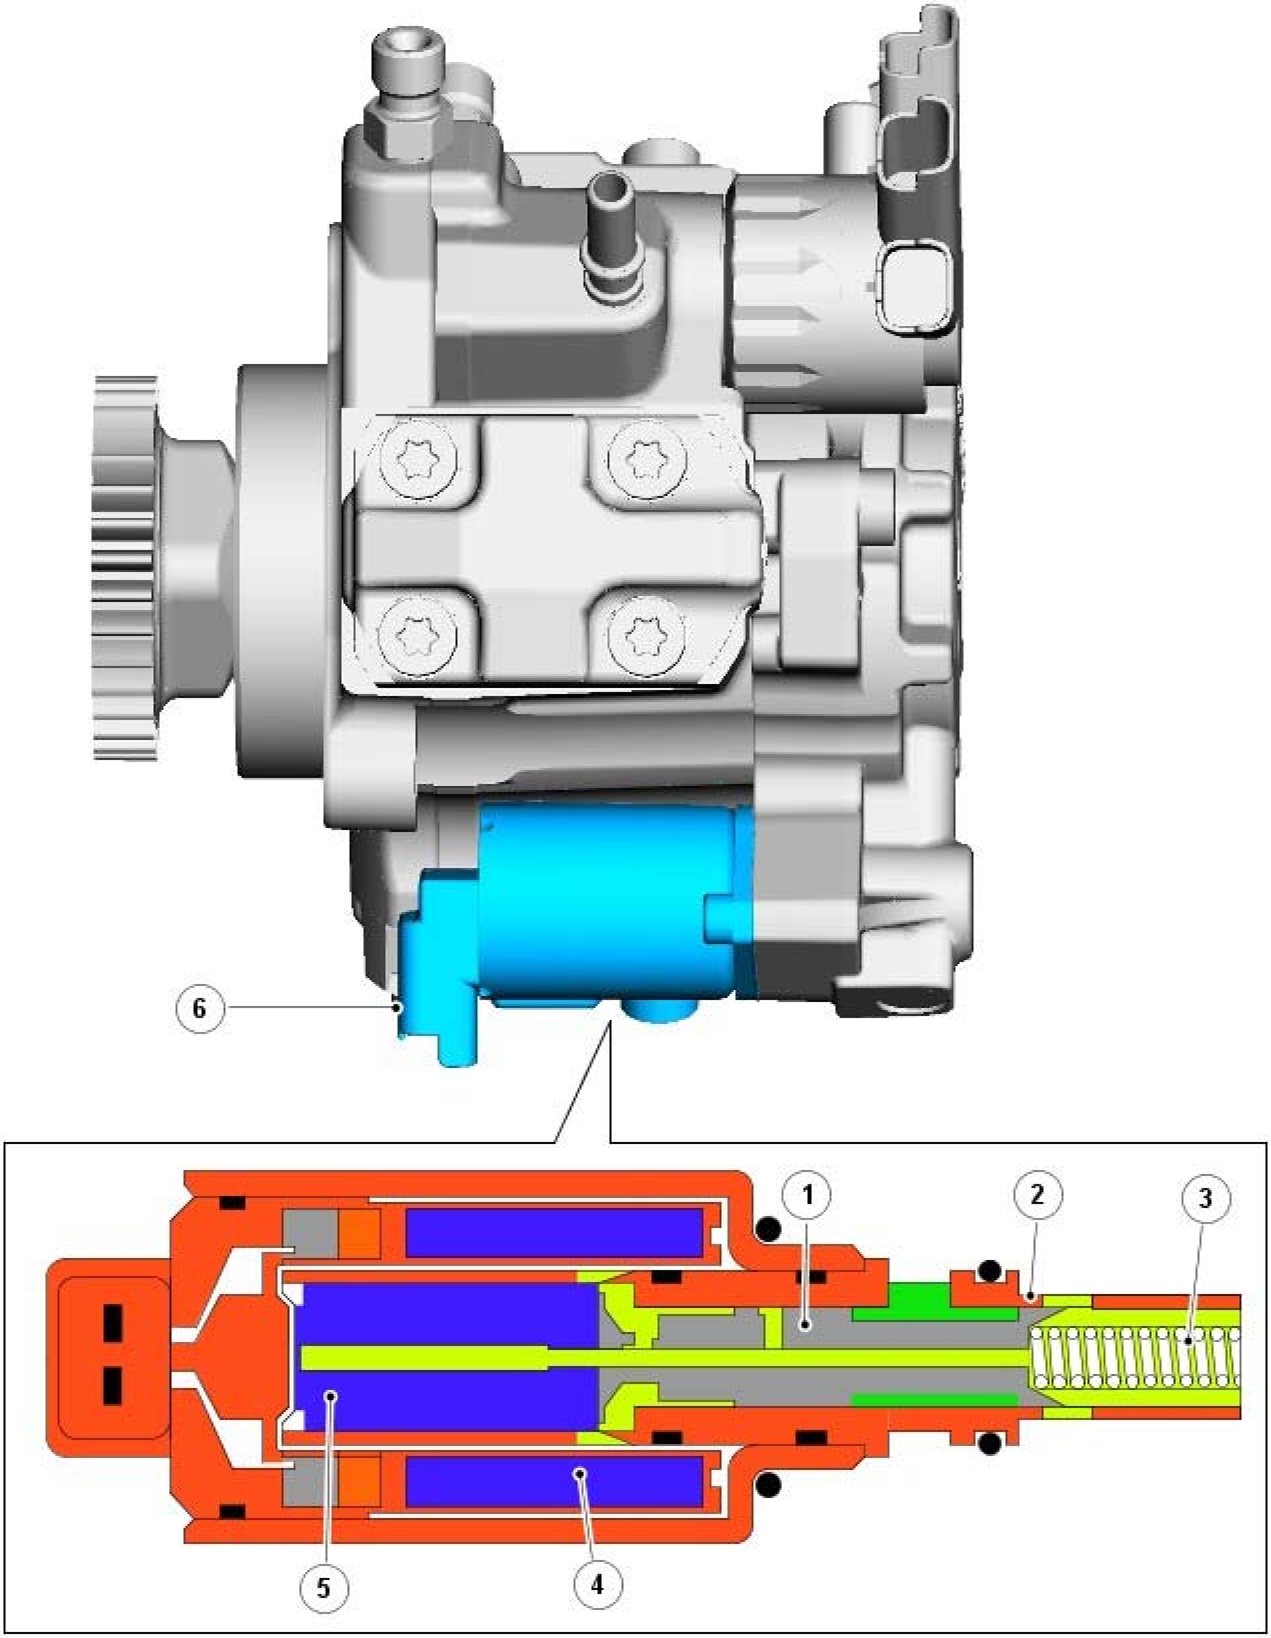
Fuel Delivery



E50837

The eccentric on the high-pressure fuel pump driveshaft (5) presses the piston (3) upwards. The inlet valve (1) is then closed through the force exerted by the valve spring and the pressure being built up in the pump cylinder. The outlet valve (2) opens when the pressure in the pump cylinder is greater than the fuel pressure in the ring line (B).

Volume Control Valve (VCV)



E81900

Item	Part Number	Description
1	-	Piston
2	-	Sleeve
3	-	Compression spring
4	-	Coil
5	-	Armature

6	-	VCV

The VCV is fixed directly to the high-pressure fuel pump.

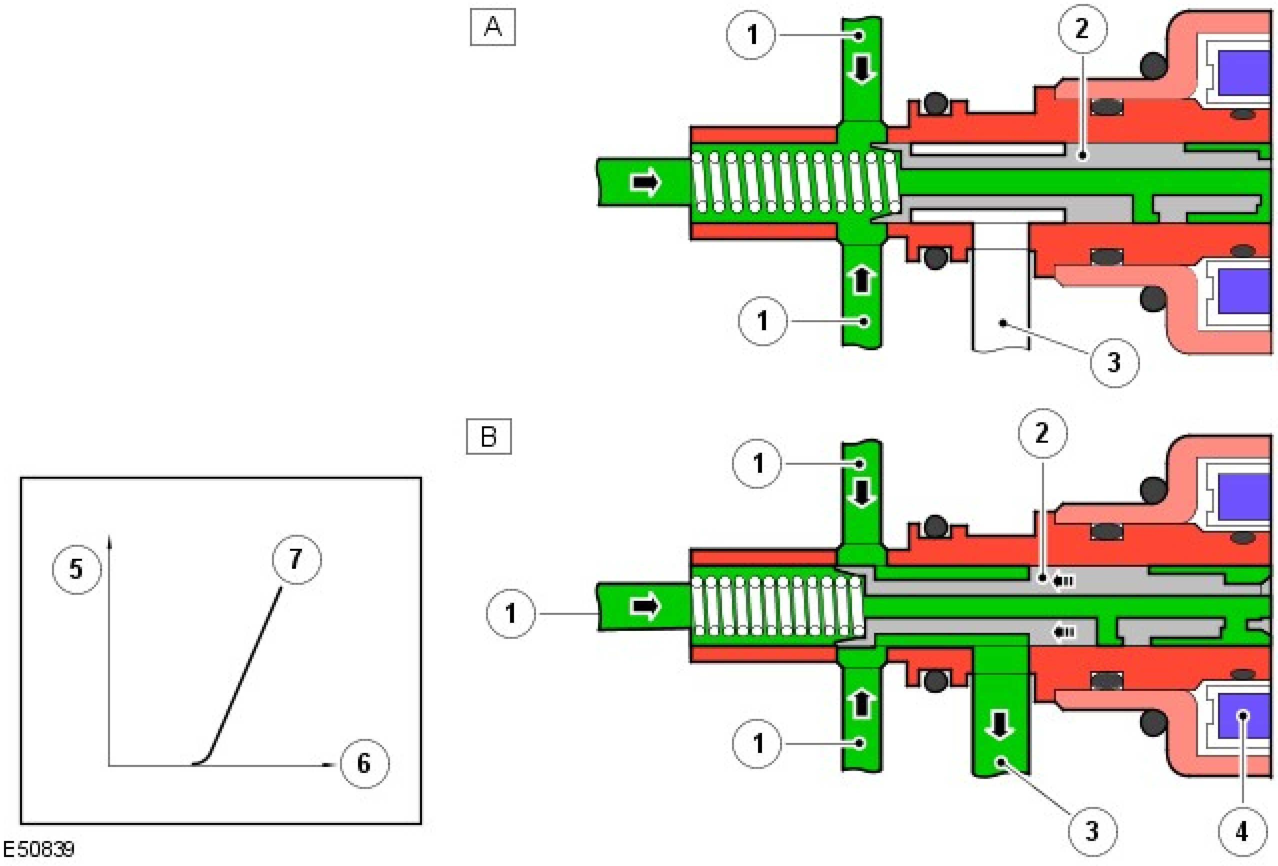
The VCV regulates the fuel supply (and hence the quantity of fuel) from the transfer pump to the high-pressure fuel pump elements, depending on the fuel pressure in the rail.

This makes it possible to match the delivery of the high-pressure fuel pump to the requirements of the engine from the low-pressure side. The quantity of fuel flowing back to the main fuel supply line is kept to a minimum.

In addition, this adjustment reduces the power consumption of the high-pressure fuel pump, improving the efficiency of the engine.

- NOTE: The fuel volume control valve default is closed without electrical supply. An open circuit connector will prevent the engine from running.

- NOTE: The VCV cannot be replaced as a separate component in service.



Item	Part Number	Description
A	-	VCV not actuated
B	-	VCV actuated
1	-	Fuel supply from the transfer pump
2	-	Piston
3	-	Fuel supply to the high-pressure fuel pump
4	-	Coil energized
5	-	Quantity of fuel
6	-	Control current
7	-	VCV at constant engine speed

VCV Not Actuated (A)

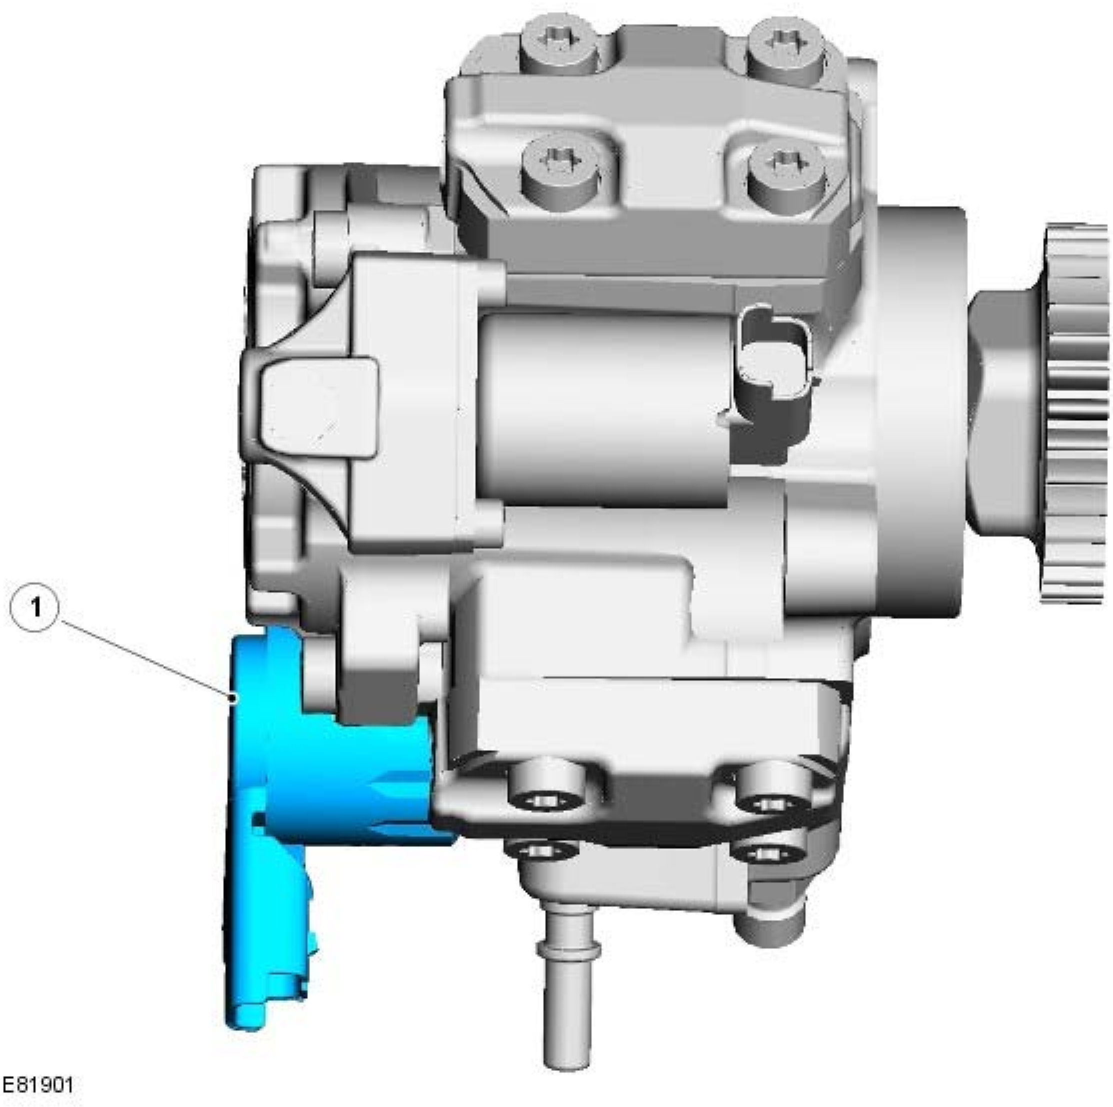
When there is no power supplied, the piston (2) closes the opening between the 2 connections (1) and (3) through the force of the compression spring. The fuel supply to the high-pressure fuel pump is interrupted.

VCV Actuated (B)

The ECM energizes the coil (4) of the valve, according to the engines requirements. The armature force is proportional to the control current and counteracts the compression spring through the moving piston (2).

As a result, the opening between the 2 connections (1) and (3) and hence the quantity of fuel (5) supplied through the connector (3) to the high-pressure fuel pump is also proportional to the control current (6). This means that the greater the opening cross-section, the greater the quantity of fuel supplied.

Pressure Control Valve (PCV)



Item	Part Number	Description
1	-	PCV

The PCV is located on the high-pressure fuel pump. It governs the fuel pressure at the high-pressure outlet of the high-pressure fuel pump and thus, the fuel pressure within the rail. In addition, the PCV dampens any fluctuations in pressure, which occur during the delivery of fuel through the high-pressure fuel pump and through the injection process.

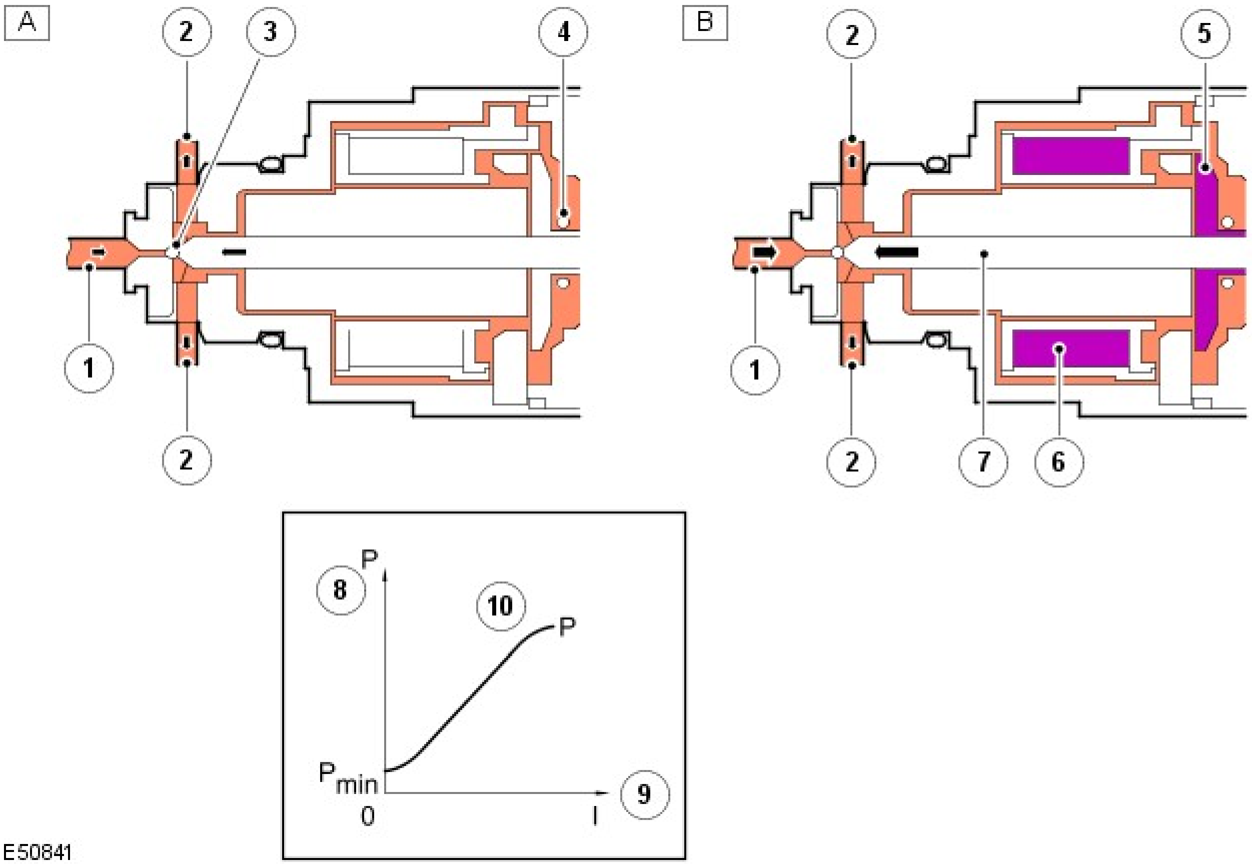
The PCV ensures that optimum pressure exists in the rail for every operating condition of the engine.

The PCV is an electro-magnetically operated valve with spring support.

The electrical current supplied by the ECM through the solenoid pulls back the control pin. This allows the diesel fuel to pass the ball valve and thus the fuel flow into the common rails.

The entire armature is coated with fuel for lubrication and cooling.

- NOTE: The PCV cannot be replaced as a separate component in service.



Item	Part Number	Description
A	-	PCV non-controlled
B	-	PCV controlled
1	-	Fuel from the high-pressure fuel pump
2	-	To fuel return
3	-	Ball valve
4	-	Compression spring
5	-	Armature
6	-	Coil energized
7	-	Control pin
8	-	High pressure fuel
9	-	Control current
10	-	Characteristic of the PCV

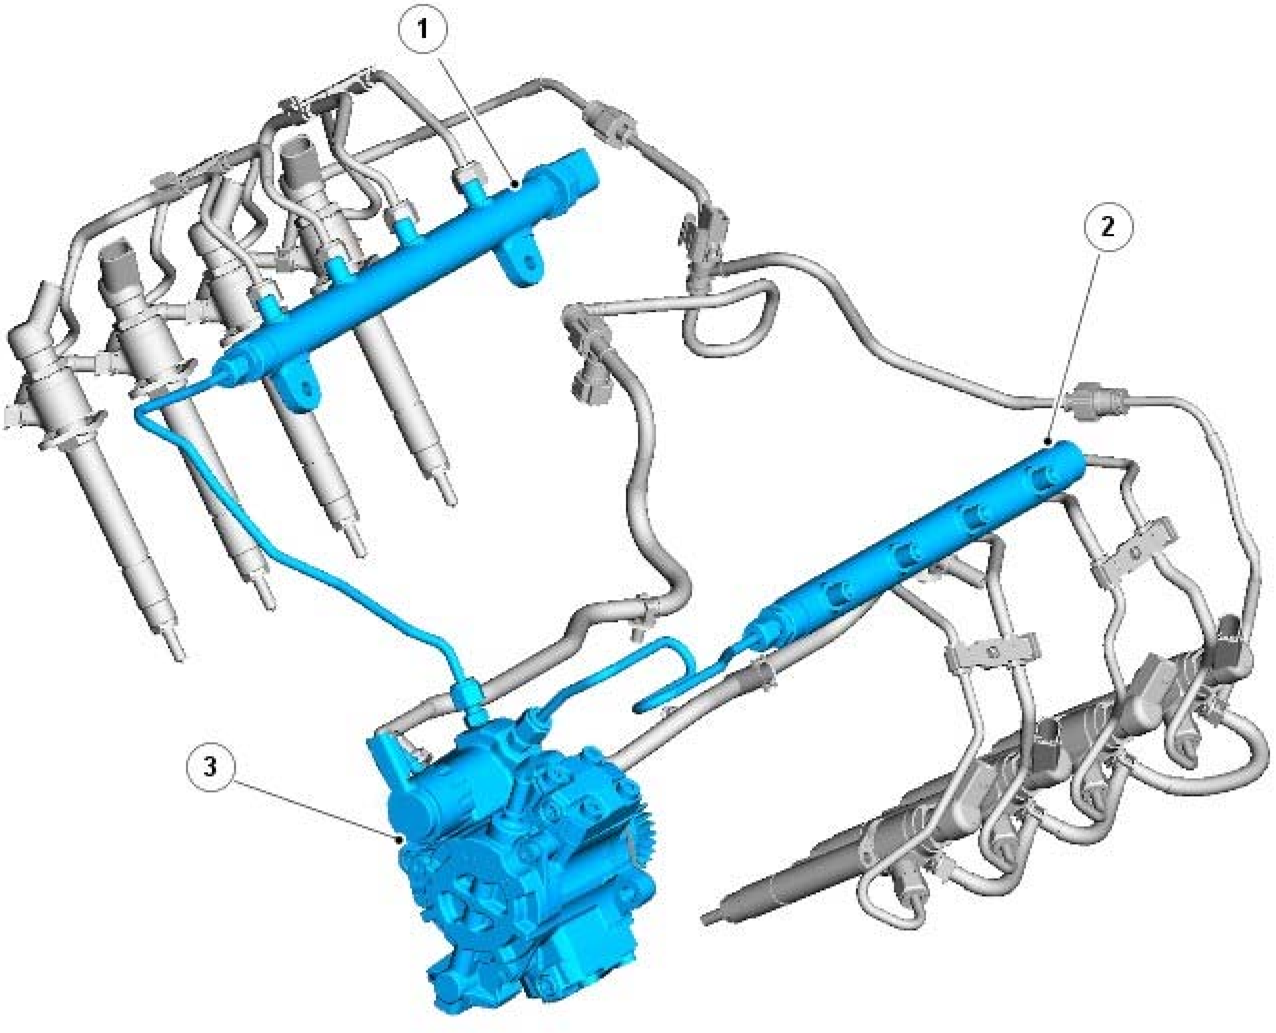
PCV Non-controlled (A)

The ball valve (3) will only be operated through the force exerted upon it by the spring (4). Thereby, the PCV is classed as open.

PCV Controlled (B)

The current flowing through the solenoid (6) draws the pin (7) down. This in turn transfers the magnetic force via the pin to the ball valve (3). The pull of the pin, and the pressure on the ball valve, is proportional to the valve flow (9).

High-Pressure Common Fuel Rails



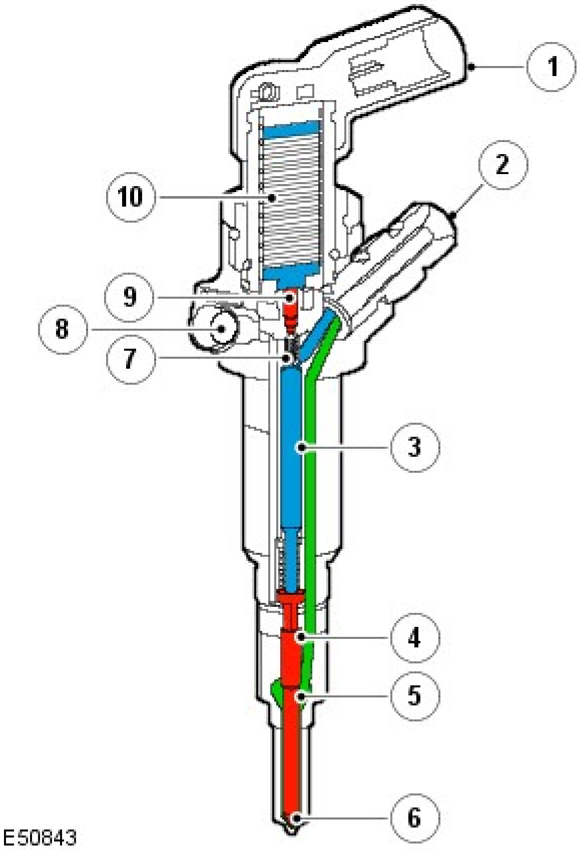
E81902

Item	Part Number	Description
1	-	RH high-pressure common fuel rail
2	-	LH high-pressure common fuel rail
3	-	High-pressure fuel pump

The fuel rails are manufactured from forged steel. They store the fuel at high-pressure and prevent pressure fluctuations in the high-pressure system.

All high-pressure pipes have an internal diameter of 2.5mm except the pipes to the injectors, which are 3.0mm. Total rail volume is 33cc.

FUEL INJECTORS



Item	Part Number	Description
1	-	Harness connection
2	-	High-pressure connection
3	-	Control piston
4	-	Nozzle needle
5	-	Nozzle high-pressure chamber
6	-	Nozzle spray holes
7	-	Valve mushroom
8	-	Fuel return
9	-	Valve piston
10	-	Piezo actuator

The fuel injectors are operated directly by the ECM for fuel metering (start of injection and quantity of fuel injected).

The operating components of the piezo fuel injectors are:

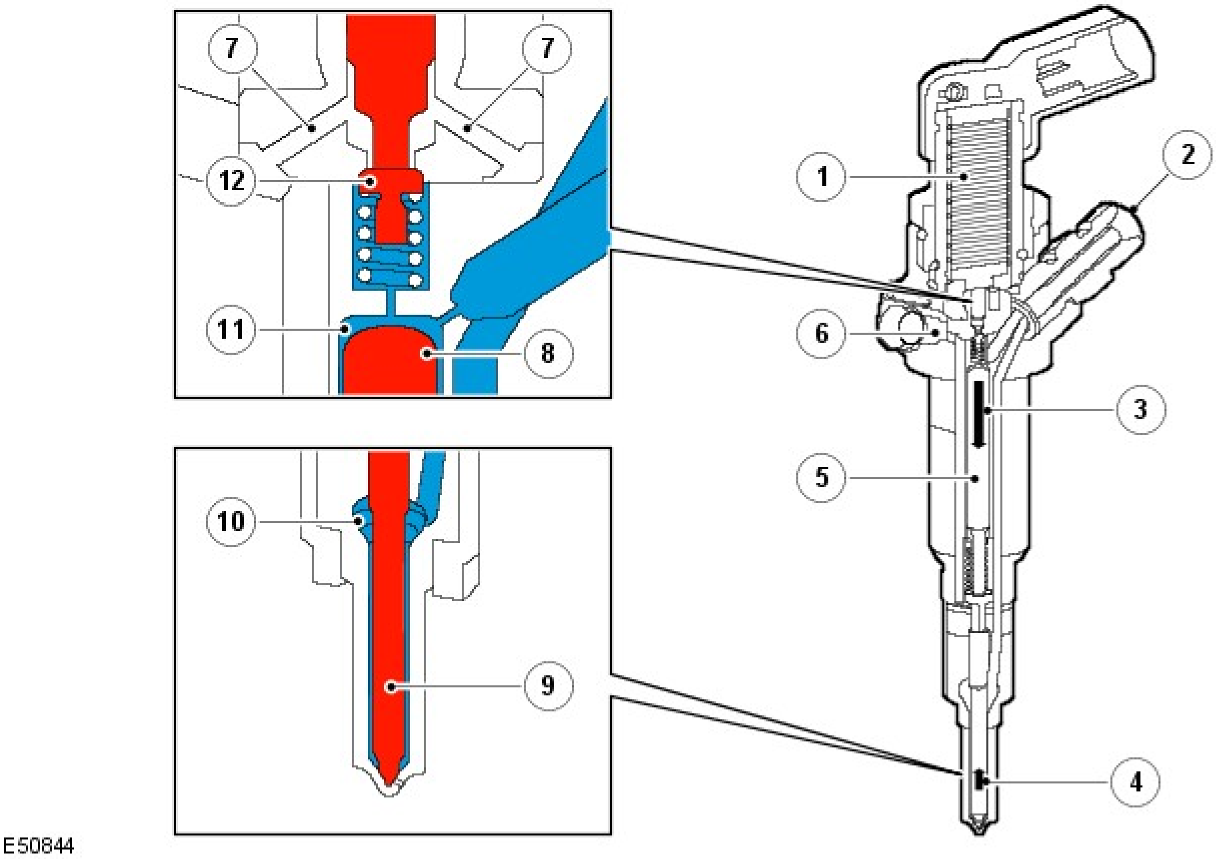
- The piezo actuator
- The injector body containing the hydraulic servo system
- The fuel injector nozzle

• NOTE: New injectors can be installed in any cylinder and DO NOT have to be configured.

• NOTE: Each injection event is controlled by a charge and discharge cycle allowing energy to dissipate in, and recover from, the injector. Never disconnect the wiring connector when the vehicle is running. The injector may remain open thus causing engine damage.

• NOTE: For safety reasons, the engine must be at standstill for 30 seconds before starting work on the high-pressure fuel system.

Fuel Injector Not Actuated (Not Injecting Fuel)



Item	Part Number	Description
1	-	Piezo actuator
2	-	High-pressure connection
3	-	Hydraulic force applied on control piston
4	-	Hydraulic force acting on tip of nozzle
5	-	Control piston
6	-	Fuel return
7	-	Fuel return
8	-	Control piston
9	-	Nozzle needle
10	-	High pressure chamber of nozzle
11	-	Control chamber
12	-	Valve mushroom

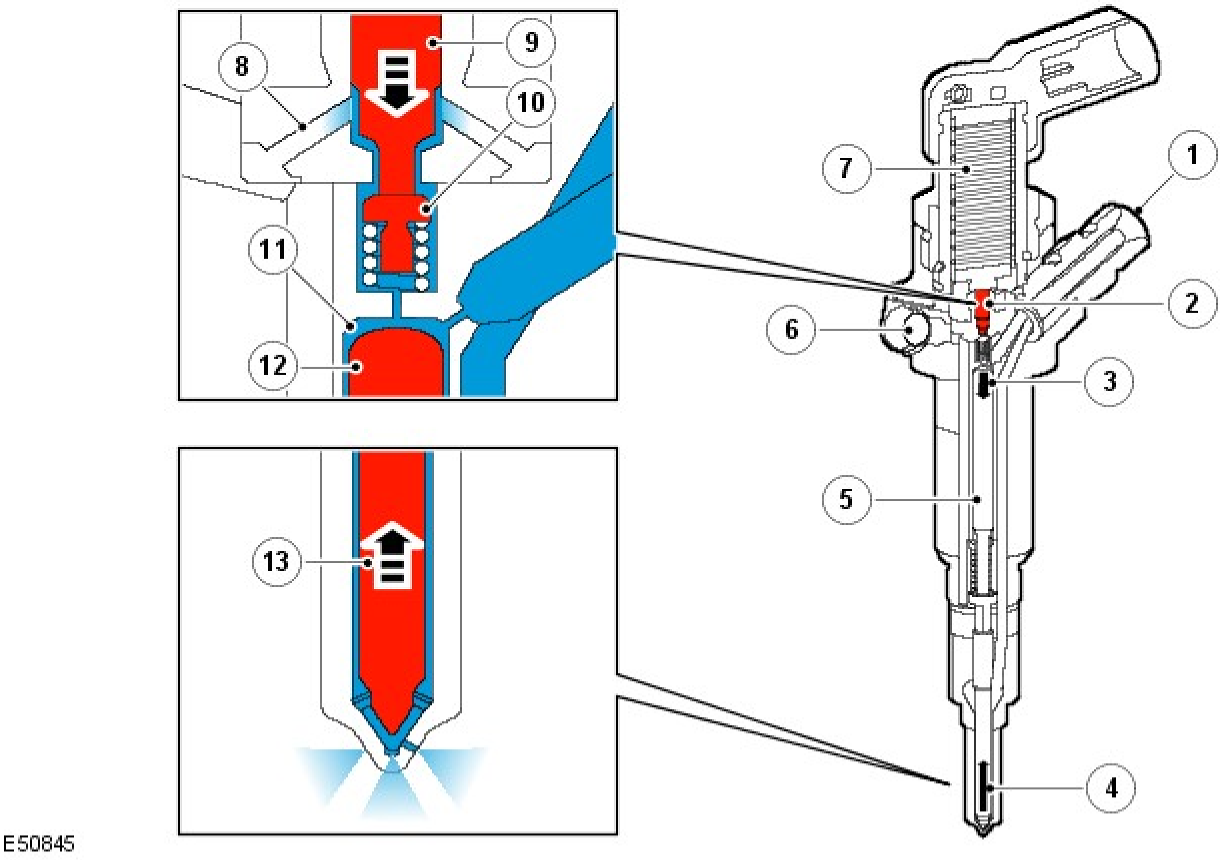
The high-pressure fuel from the fuel-rail passes through the high-pressure connection (2) into the control chamber (11) and into the high-pressure chamber (10) of the fuel injector nozzle.

The piezo actuator (1) is currentless and the valve mushroom (12) closes the bore to the fuel return (7) by means of spring pressure.

There is however a continuous fuel return (6) to vent internal leakage within the injector.

The hydraulic force (3), which is now applied on the control piston by the fuel under high-pressure in the control chamber (11) through the control piston (8), is greater than the hydraulic force (4) acting on the tip of the nozzle (since the area of the control piston in the control chamber is greater than the area of the tip of the nozzle).

Fuel Injector Actuated (Injecting Fuel)



Item	Part Number	Description
1	-	High-pressure supply
2	-	Valve piston
3	-	Hydraulic force applied on control piston
4	-	Hydraulic force acting on tip of nozzle
5	-	Control piston
6	-	Fuel return
7	-	Piezo actuator
8	-	Fuel return
9	-	Valve piston
10	-	Valve mushroom
11	-	Control chamber
12	-	Control piston
13	-	Nozzle needle

The piezo actuator (7) energized by the ECM extends (charging phase) and presses on the valve piston (9). The valve mushroom (10) opens the bore, which connects the control chamber (11) to the fuel return (8 then 6).

As a result, the pressure in the control chamber drops, and the hydraulic force (4) acting on the tip of the nozzle needle is now greater than the force (3) acting on the control piston in the control chamber.

The nozzle needle (13) moves upwards and the fuel passes through the 6 spray holes into the combustion chamber.

Engine Starting

During starting, the fuel rail pressure must be at least 150 bar. Should the pressure be below this figure, the injectors will not operate, resulting in the vehicle not starting.

Engine Stopped

To stop the engine the ECM stops energizing the piezo actuators, therefore, no fuel is injected and the engine speed drops to zero.

- WARNINGS:

⚠ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ The spilling of fuel is unavoidable during this operation. Make sure that all necessary precautions are taken to prevent fire and explosion.

⚠ Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

⚠ Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1700 bar (24,656 lb-sq-in). Failure to follow this instruction may result in personal injury.

⚠CAUTION: Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
   For additional information, refer to: Engine Cover - TDV8 3.6L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Remove the battery tray.
   For additional information, refer to: Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).
4. Recover the air conditioning (A/C) refrigerant.

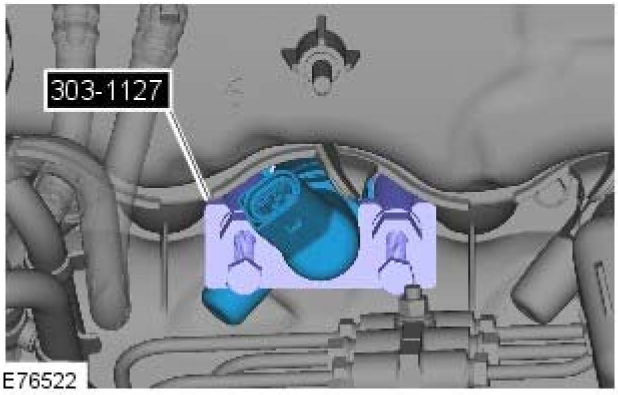
16. CAUTION: Make sure the fuel injector remover legs are correctly engaged to the fuel injector. Failure to follow this instruction may result in damage to the component.

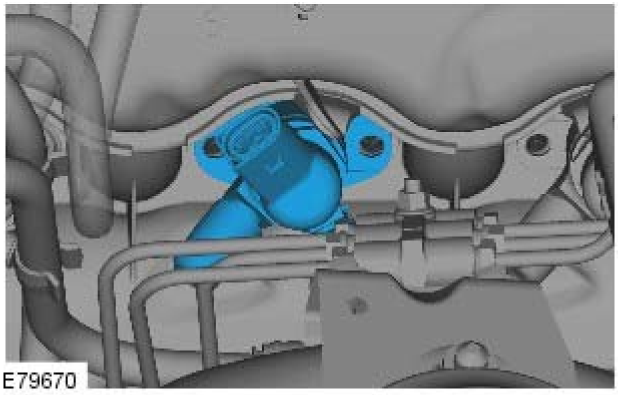
Install the special tool remover legs to the studs.



17. Install the special tool locking plate to the remover legs.

18. Release the fuel injector.

- Rotate the special tool bolts evenly, in a clockwise direction.
- Remove the special tool.



19. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Remove the fuel injector.

- Remove and discard the fuel injector clamp.
- Remove and discard the sealing washer.

20. Remove the remaining fuel injectors.

21. ⚠ CAUTION: Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection pump until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

Using the pneumatic vacuum gun, vacuum foreign material from the high-pressure fuel supply line, the fuel injectors and the fuel rail.

Installation

1. CAUTIONS:

⚠ Do not disassemble the fuel injectors or clean the nozzles, even with an ultrasonic cleaner. Always install new fuel injectors when required.

⚠ Do not use tools to install the new fuel return line clip. Failure to follow this instruction will result in damage to the clip.

Install a new fuel injector clamp.

- Install a new sealing washer.
- Install a new fuel return line clip.

2. ⚠ CAUTION: Only tighten the bolts finger-tight at this stage.

• NOTE: Remove and discard the blanking caps.

Install the fuel injector.

- Loosely install the bolts.

3. ⚠ CAUTION: Make sure the fuel return line clip is correctly installed to the fuel injector before installing the fuel return line.

Connect the fuel return line to the fuel injector.

- Visually inspect the fuel return line O-ring seal for damage.
- Lubricate the O-ring seal with a suitable lubricant.

4. Install the remaining fuel injectors.

5. CAUTIONS:

⚠ Maintain pressure on the high-pressure fuel supply line to keep the olives in contact with the fuel injectors and the fuel rail cones while installing unions.

⚠ Do not allow the unions to hit the olive ends of the high-pressure fuel supply line as this may damage the ends of the high-pressure fuel supply line and allow foreign matter to enter the fuel injection system.

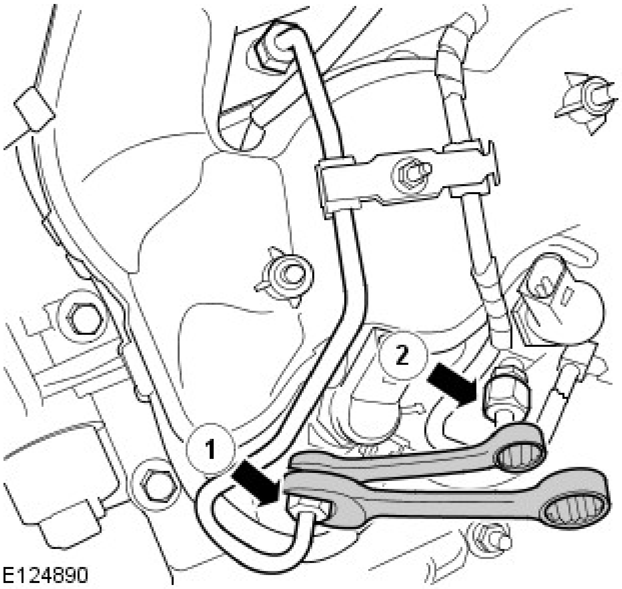
⚠ Only tighten the unions finger-tight at this stage.

• NOTE: Remove and discard the blanking caps.

Loosely install the new high-pressure fuel supply lines.

6. Secure the fuel injectors.

- Evenly and progressively tighten the bolts to 10 Nm (7 lb.ft).



7. CAUTIONS:

⚠ Do not allow the unions to hit the olive ends of the high-pressure fuel supply line as this may damage the ends of the line and allow foreign matter to enter the fuel injection system.

⚠ Caution | Fuel | Maintain pressure on the high-pressure fuel supply lines to keep the olives in contact with the fuel rail and the fuel injector cones while installing unions.

⚠ Do not use any aggressive cleaning fluid or a wire brush to clean the fuel injector nozzle.

• NOTE: Remove and discard the blanking caps.

Install the new high-pressure fuel supply lines.

- Install the new high-pressure fuel supply line, tighten the fuel supply line unions finger tight.
- Tighten the high-pressure fuel supply line in the shown sequence.
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 15 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 15 Nm.
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 35 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 35 Nm.

8. Connect the fuel injector electrical connectors.

- Secure the fuel charging wiring harness.

9. Install the fuel line shield.

- Tighten the nuts to 10 Nm (7 lb.ft).

10. Secure the coolant lines.

- Tighten the bolt.
- Tighten the nuts.

11. NOTE: Remove and discard the blanking caps.

Install the A/C lines.

- Install new O-ring seals.
- Tighten the bolt.
- Attach the clamp.
- Tighten the nut.

12. NOTE: Remove and discard the blanking caps.

Connect the high and low-pressure A/C lines.

- Install new O-ring seals.
- Tighten the bolts.

13. Recharge the A/C system.

- WARNINGS:

⚠ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ The spilling of fuel is unavoidable during this operation. Make sure that all necessary precautions are taken to prevent fire and explosion.

⚠ Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1700 bar (24,656 lb-sq-in). Failure to follow this instruction may result in personal injury.

⚠ Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

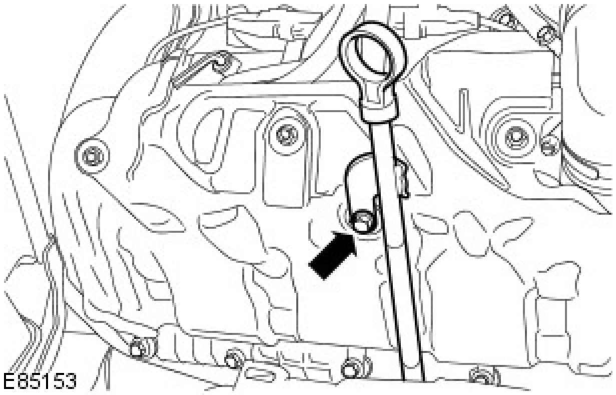
⚠ Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

⚠CAUTION: Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the engine cover.
For additional information, refer to: Engine Cover - TDV8 3.6L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

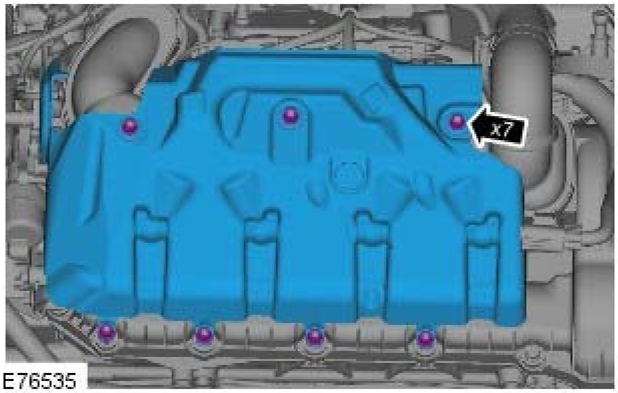
3. Remove the auxiliary battery tray.
For additional information, refer to: Auxiliary Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).



4. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

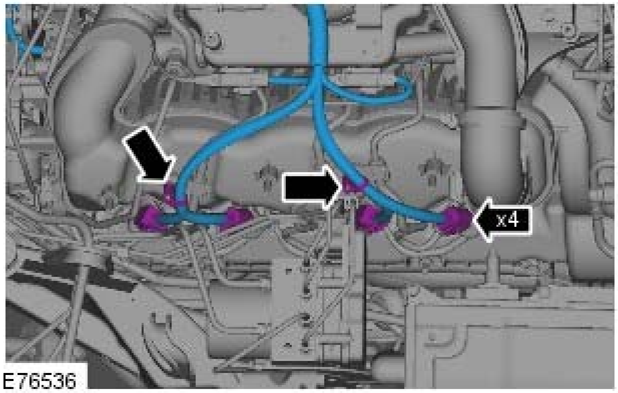
Remove the oil level indicator and upper oil level indicator tube.

- Remove the bolt.
- Remove and discard the 2 O-ring seals.



5. Remove the fuel line shield.

- Remove the 7 nuts.



6. Disconnect the fuel injector electrical connectors.

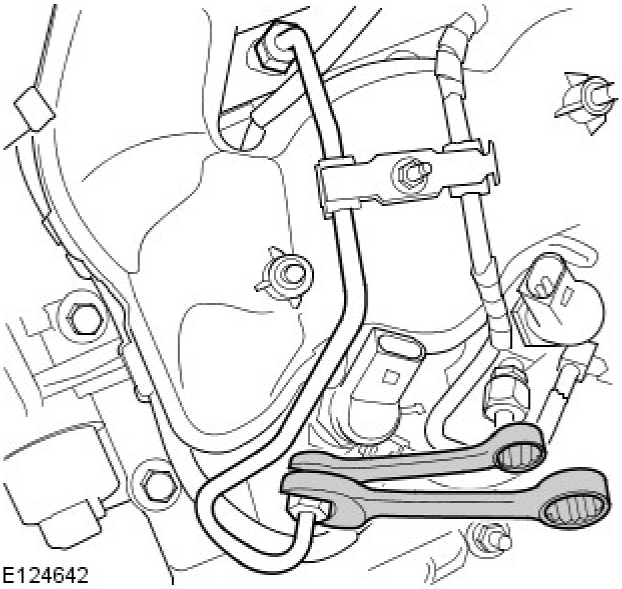
- Release the fuel charging wiring harness.

7. CAUTIONS:

⚠ Make sure that the high-pressure fuel supply line remains in contact with the fuel pump and fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠ Do not use any aggressive cleaning fluid or a wire brush to clean the fuel injector nozzle.

Using the pneumatic vacuum gun, vacuum foreign material from the high-pressure fuel supply lines, the fuel injectors and the fuel rail.
For additional information, refer to: Fuel Injection Component Cleaning (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, General Procedures).



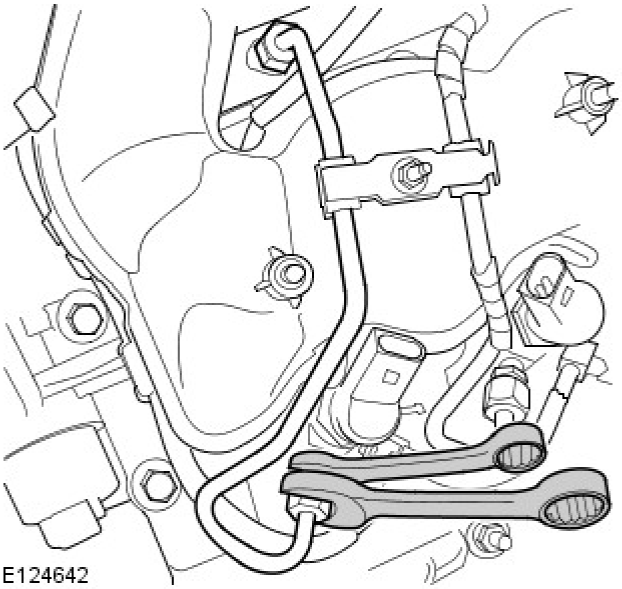
E124642

8. CAUTIONS:

⚠ Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection diverter rail until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠ Make sure that the fuel injector adaptor union does not move when loosening the high-pressure fuel supply lines. Failure to follow this instruction may result in damage to the fuel injector or the fuel injector adaptor union.

Loosen the high-pressure fuel supply line from the fuel injector and fuel rail.

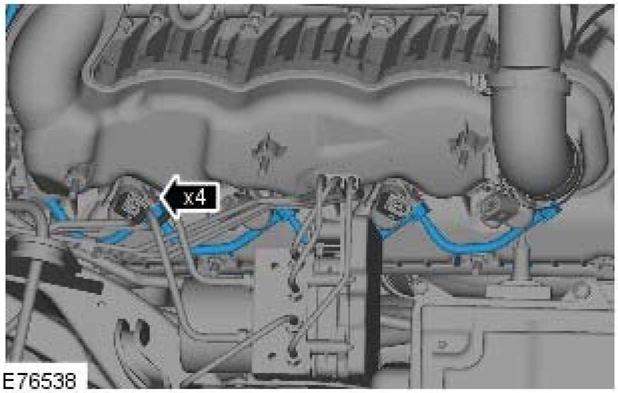


E124642

9. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

• NOTE: Right-hand shown, left-hand similar.

Remove and discard the high-pressure fuel supply line.

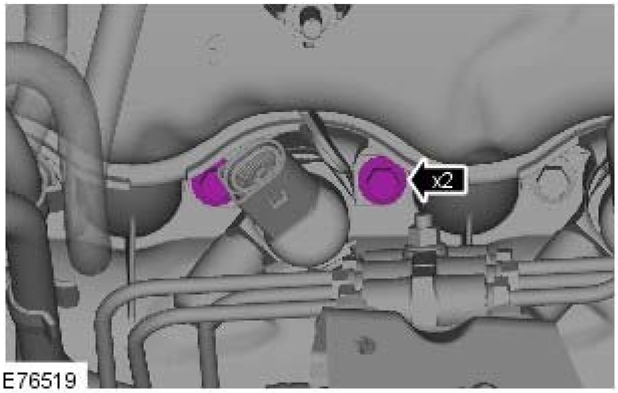


E76538

10. Disconnect the fuel return line from the fuel injector.

- Remove and discard the fuel return line clip.

11. Remove the 2 fuel injector bolts.

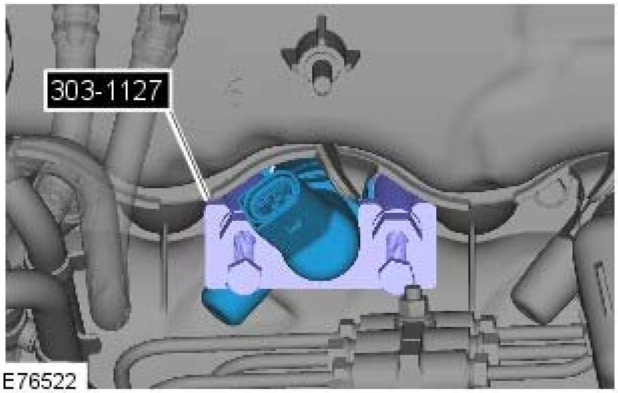


12. Install the special tool studs.

13. ⚠ CAUTION: Make sure the fuel injector remover legs are correctly engaged to the fuel injector. Failure to follow this instruction may result in damage to the component.

Install the special tool remover legs to the studs.

14. Install the special tool locking plate to the remover legs.



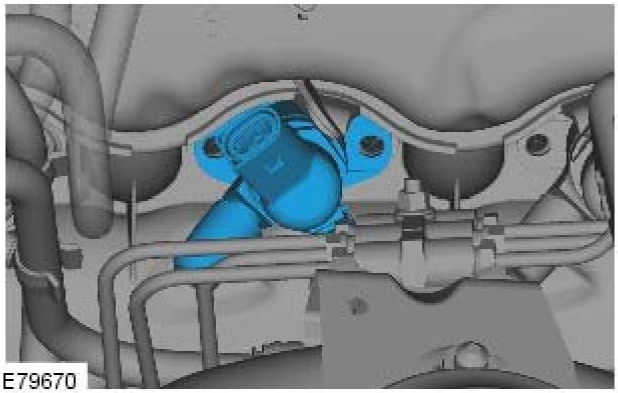
15. Release the fuel injector.

- Rotate the special tool bolts evenly, in a clockwise direction.
- Remove the special tool.

16. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Remove the fuel injector.

- Remove and discard the fuel injector clamp.
- Remove and discard the sealing washer.



17. Remove the remaining fuel injectors.

Installation

1. CAUTIONS:

⚠ Do not disassemble the fuel injectors or clean the nozzles, even with an ultrasonic cleaner. Always install new fuel injectors when required.

⚠ Do not use tools to install the new fuel return line clip. Failure to follow this instruction will result in damage to the clip.

Install a new fuel injector clamp.

- Install a new sealing washer.
- Install a new fuel return line clip.

2. ⚠ CAUTION: Only tighten the bolts finger-tight at this stage.

• NOTE: Remove and discard the blanking caps.

Install the fuel injector.

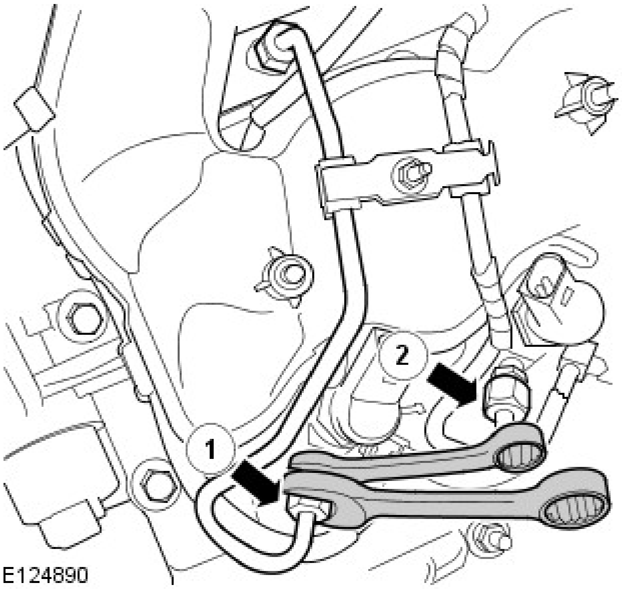
- Loosely install the bolts.

3. Install the remaining fuel injectors.

4. ⚠ CAUTION: Make sure the fuel return line clip is correctly installed to the fuel injector before installing the return line.

Connect the fuel return line to the fuel injector.

- Visually inspect the fuel return line O-ring seal for damage.
- Lubricate the O-ring seal with petroleum jelly.



5. CAUTIONS:

⚠ Do not allow the unions to hit the olive ends of the high-pressure fuel supply line as this may damage the ends of the line and allow foreign matter to enter the fuel injection system.

⚠ Caution | Fuel | Maintain pressure on the high-pressure fuel supply lines to keep the olives in contact with the fuel rail and the fuel injector cones while installing unions.

• NOTE: Remove and discard the blanking caps.

Install the new high-pressure fuel supply lines.

- Install the new high-pressure fuel supply line, tighten the fuel supply line unions finger tight.
- Tighten the high-pressure fuel supply line in the shown sequence.
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 15 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 15 Nm.
- Tighten the high-pressure fuel supply line union 1 to fuel injector to 35 Nm.
- Tighten the high-pressure fuel supply line union 2 to fuel rail to 35 Nm.

6. Connect the fuel injector electrical connectors.

- Attach the fuel charging wiring harness.

7. Install the fuel line shield.

- Tighten the nuts to 10 Nm (7 lb.ft).

8. ⚠ CAUTION: Make sure the upper oil level indicator tube nut is not damaged, replace the nut as required. Failure to follow this instruction may result in damage to the vehicle.

• NOTE: Remove and discard the blanking caps.

Install the oil level indicator and upper oil level indicator tube.

- Clean the components mating faces.
- Install new O-ring seals.
- Tighten the bolt.

9. Install the auxiliary battery tray.
For additional information, refer to: Auxiliary Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).

10. Install the engine cover.
For additional information, refer to: Engine Cover - TDV8 3.6L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

11. Connect the battery ground cable.

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

CAUTION: Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

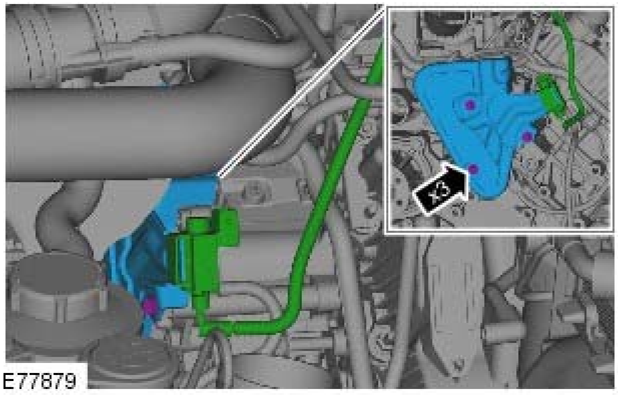
2. Raise and support the vehicle.

3. Remove the intake manifold.
For additional information, refer to: Intake Manifold Plenum Chamber (303-01D Engine - TDV8 3.6L Diesel, In-vehicle Repair).

4. Remove the cooling fan assembly.
For additional information, refer to: Cooling Fan (303-03E Engine Cooling - TDV8 3.6L Diesel, Removal and Installation).

5. Remove the fuel pump shield.

- Release the vacuum solenoid.
- Remove the 3 bolts.



6. Using the pneumatic vacuum gun, vacuum foreign material from the high-pressure fuel supply lines, the fuel rails and the fuel injection pump.
For additional information, refer to: Fuel Injection Component Cleaning (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel,

11. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Remove the fuel pump.

- Remove the 3 bolts.
- Remove and discard the gasket.

Installation

1. Install the fuel pump.

- Clean the component mating faces.
- Install a new gasket.
- Apply loctite 572 to the fuel pump bolt threads.
- Loosely install the bolts.

2. Loosely install the new high-pressure fuel supply lines.

3. Secure the fuel pump.

- Tighten the bolts to 23 Nm (17 lb.ft).

4. NOTE: Remove and discard the blanking caps.

Secure the high-pressure fuel supply lines.

- Stage 1: Tighten the high-pressure fuel supply line unions at the fuel rails to 15 Nm (11 lb.ft).
- Stage 2: Tighten the high-pressure fuel supply line unions at the fuel pump to 15 Nm (11 lb.ft).
- Stage 3: Tighten the high-pressure fuel supply line unions at the fuel rail to 35 Nm (26 lb.ft).
- Stage 4: Tighten the high-pressure fuel supply line unions at the fuel pump to 35 Nm (26 lb.ft).
- Secure the vacuum hose.

5. Secure the high-pressure fuel supply line clips.

- Tighten the bolts to 10 Nm (7 lb.ft).

6. NOTE: Remove and discard the blanking caps.

Connect the low-pressure fuel lines.

7. Connect the fuel injection control pressure sensor electrical connector.

8. Connect the fuel metering valve electrical connector.

9. Install the fuel pump shield.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Secure the vacuum solenoid.

10. Install the intake manifold.

Fuel Charging and Controls - TDV8 3.6L Diesel - Fuel Injection Component Cleaning

General Procedures

- WARNINGS:

Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1700 bar (24,656 lb-sq-in). Failure to follow this instruction may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

Place the vehicle in a well ventilated, quarantined area and arrange ' No Smoking/Petrol Fumes' signs about the vehicle.

Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

- CAUTIONS:

Before using the cleaning fluid, protect all electrical components and connectors with lint-free non-flocking material.

Make sure that all parts removed from the vehicle are placed on the lint-free non-flocking material.

Make sure that any protective clothing worn is clean and made from lint-free non-flocking material.

Make sure that clean non-plated tools are used. Clean tools using a new brush that will not lose its bristles and fresh cleaning fluid, prior to starting work on the vehicle.

Use a steel topped workbench and cover it with clean, lint-free non-flocking material.

Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

- NOTE: Pneumatic vacuum gun

1. Using a new brush that will not lose its bristles, brush cleaning fluid onto the components being removed and onto the surrounding area.
2. Using a pneumatic vacuum gun, remove all traces of cleaning fluid and foreign material.
3. Dispose of any used cleaning fluid and the brush after completing the repair.

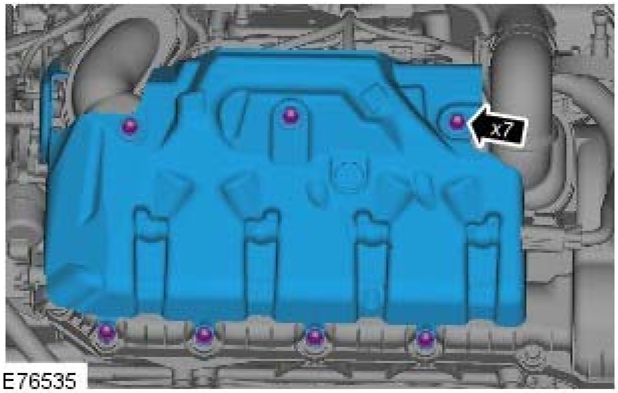
- Remove the 2 nuts.

11. Remove the oil filler cap.



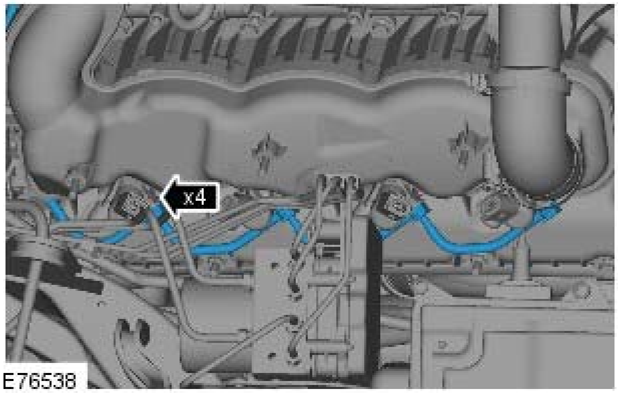
12. NOTE: RH illustration shown, LH is similar

Remove the LH fuel line shield.

- Remove the 7 nuts.

13. Install the oil filler cap.

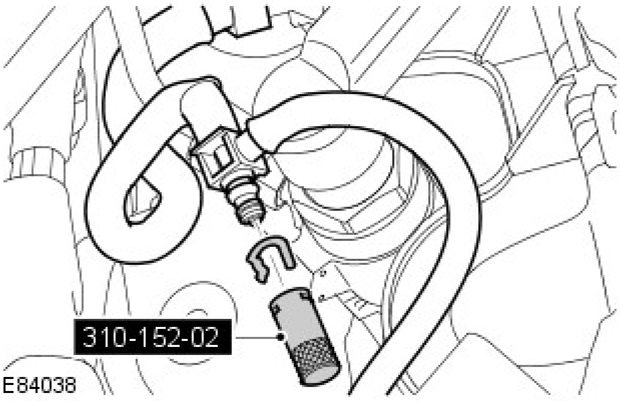
14. Using the pneumatic vacuum gun, vacuum foreign material from the high-pressure fuel supply lines, the fuel injectors and the fuel rail.
For additional information, refer to: Fuel Injection Component Cleaning (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, General Procedures).



15. WARNING: The spilling of fuel is unavoidable during this operation. Make sure that all necessary precautions are taken to prevent fire and explosion.

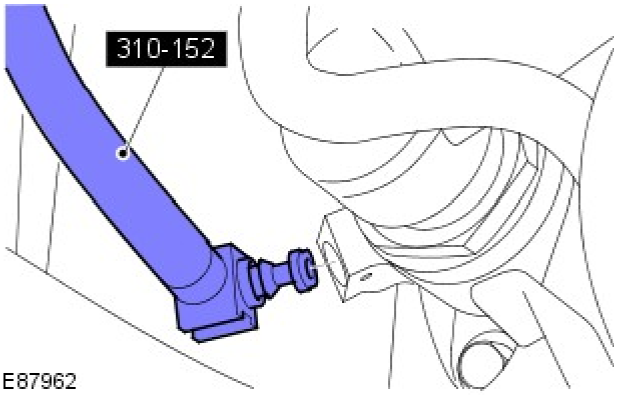
Disconnect the fuel return line from the LH bank fuel injectors.

- Remove and discard the 4 fuel return line clips.



16. Blank-off each of the fuel return line ends with blanking caps from the kit.

- Install the clips.



17. Connect a spill bottle line to each of the injectors.

18. Install the battery tray.

19. Install the battery.

20. Connect the battery positive cable.

- Tighten the battery positive lead nut to 10 Nm (7 lb.ft).

21. Connect the battery ground cable.

- Tighten the battery positive lead nut to 10 Nm (7 lb.ft).

22. Connect the Land Rover approved diagnostic system to the vehicle.

23. Run cylinder balance test from 'live data'.

- Injector balance limits are between 960 and 1.4 k.
- Note any injector that is outside of these figures (a figure below the limit will usually mean a reduction in fuelling, and a figure above will result in an increase to fuelling).

24. Start the engine and allow to run for 2 minutes, stop the engine.

25. ⚠ CAUTION: Do not reject any of the injectors if the spill rates are even but outside of the correct rates shown. The spill rate can be affected by varying fuel rail pressure and fuel temperature. Only suspect a faulty injector(s) if the amount of fuel collected is significantly higher or lower than the others.

• NOTE: The figures shown are to be used as a guide only.

• NOTE: A faulty injector could fill a bottle within 2 minutes.

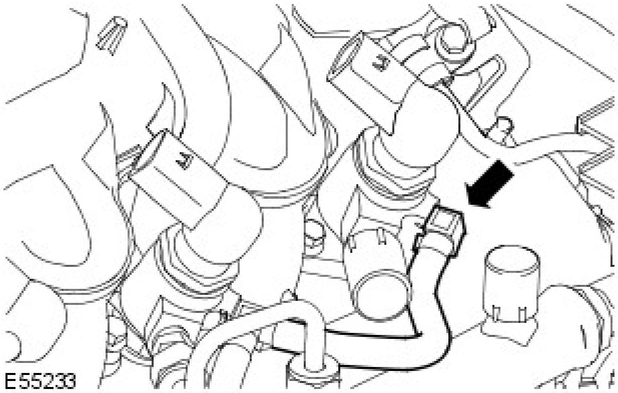
Observe the spill into bottles, if any bottle starts to fill up quickly stop engine to prevent further spillage.

26. Disconnect the battery ground cable.

27. Disconnect the spill bottle lines from the injectors.

28. Remove the blanking caps from the fuel return line ends.

- Remove the clips.



29. ⚠ CAUTION: Make sure the fuel return line clip is correctly installed to the fuel injector before installing the fuel return line.

Connect the fuel return line to the fuel injectors.

- Install new fuel return line clips.
- Visually inspect the fuel return line O-ring seals for damage.
- Apply a light coating of petroleum jelly to the fuel return line O-ring seals.

30. Carry out steps 14 to 17, step 21 and steps 23 to 29 on the RH bank injectors.

31. Disconnect the battery positive cable.

32. Remove the battery.

33. Remove the battery tray.

34. Remove the oil filler cap.

- Remove and discard the O-ring seal.

35. Install the LH fuel line shield.

- Tighten the nuts to 5 Nm (4 lb.ft).

36. Install the oil filler cap.

- Install a new O-ring seal.

37. Secure the coolant lines.

- Tighten the nuts to 10 Nm (7 lb.ft).

38. Install the battery tray.
For additional information, refer to: Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).

39. Install the RH fuel line shield.

- Tighten the nuts to 5 Nm (4 lb.ft).

40. NOTE: Remove and discard the blanking caps.

Install the oil level indicator and upper oil level indicator tube.

- Clean the components mating faces.
- Install new O-ring seals.
- Tighten the bolt.

41. Install the driver side battery compartment tray.

- Tighten the nuts to 12 Nm (9 lb.ft).

42. Install the driver side battery compartment side wall.

- Secure the clips.

43. Install the driver side battery compartment side wall extension.
44. Install the driver side battery compartment lid.
    - Secure the clips.
45. Install the engine cover.
    For additional information, refer to: Engine Cover - TDV8 3.6L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

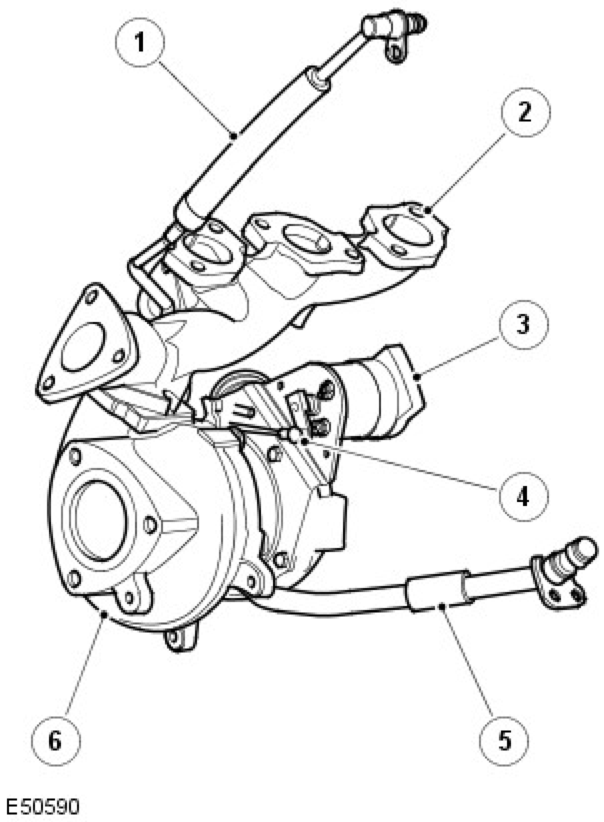
Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel - Turbocharger

Description and Operation



Item	Part Number	Description
1	-	Oil feed pipe
2	-	LH exhaust manifold
3	-	Actuator motor
4	-	Actuator lever
5	-	Oil return pipe
6	-	Turbocharger

The variable vane turbocharger, fitted to the LH exhaust manifold of the TdV6 engine, makes it possible to vary the exhaust gas flow of the turbine, dependent on engine operation. This improves the power transfer to the turbine wheel and compressor, particularly at low engine speeds, thus increasing the boost pressure. The guide vanes are opened progressively as the engine speed increases so that the power transfer always remains in balance with the required charger speed and the required boost pressure level. Variable vanes facilitate better use of the exhaust gas energy so as to further improve the efficiency of the turbocharger and thus of the engine, compared to the more conventional 'wastegate control'.

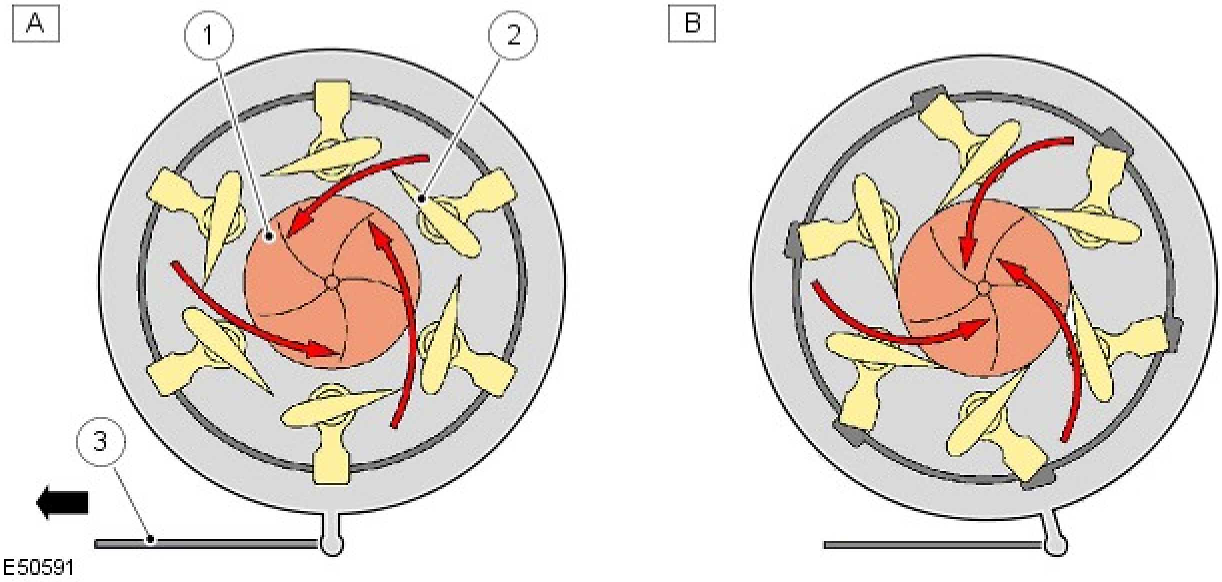
Advantages:

- High torque at both high and low engine speeds
- Continuous and optimum adjustment for all engine speeds
- No wastegate valve required as exhaust energy is better utilised. Less back-pressure in conjunction with same compressor work
- Low thermal and mechanical load improves engine power output
- Low emissions
- Optimised fuel consumption over the entire engine speed range

The DC rotary actuator motor operates a drive shaft. The drive shaft is connected to the vanes by an actuating lever. Adjustment of the vanes is achieved by moving the actuating lever. When the drive shaft is turned, a signal is created at the end of the drive shaft; this feedback signal is used to determine the angular position of the vanes. This information is transmitted to the Engine Control Module (ECM).

There is a temperature sensor in the control unit, which drives the stepper motor to a safe position (vanes fully opened) if the maximum temperature is exceeded. The ECM detects any malfunctions in the stepper motor and generates Diagnostic Trouble

Codes (DTC).



Item	Part Number	Description
A	-	Closed (fast)
B	-	Open (slow), default position
1	-	Turbine
2	-	Vanes
3	-	Actuator lever

At low engine speeds, because of the flat setting of the vanes, the relatively low flow of exhaust gases are accelerated and routed in such a way that they meet the vanes of the turbine wheel at the outermost edge. Consequently, a high torque is produced at the turbine wheel, and a high turbine speed is therefore achieved.

At high engine speeds the vanes are progressively opened, so that a large flow of exhaust gas is delayed and is directed more and more towards the centre of the turbine wheel.

The torque at the turbine wheel is artificially lowered. In this way the turbine speed, and therefore the air quantity required by the engine, are matched to engine speed. Consequently, the boost pressure is approximately constant over the whole engine speed range.

The operating parameters are controlled electronically by the ECM using powertrain sensors and driver inputs.
For additional information, refer to: Electronic Engine Controls (303-14C Electronic Engine Controls - TDV6 2.7L Diesel, Description and Operation).

The turbocharger is designed for fail-safe operation. If a fault occurs regarding the control of the unit, the vanes default to the fully open position so as to produce minimum boost.

Diagnosis and Testing

Overview

For information on the operation of the system, refer to the relevant section in the workshop manual.

Inspection and verification

- WARNINGS:

⚠ The following tests may involve working in close proximity to hot components. Make sure adequate protection is used. Failure to follow this instruction may result in personal injury.

⚠ The turbocharger can continue to rotate after the engine has stopped. Do not attempt to check the turbocharger until one minute has elapsed since the engine was switched off. Failure to follow this instruction may result in personal injury.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection chart

Mechanical	Electrical
● Intake air system ● Hose(s)/hose connections ● Turbocharger ● General engine condition.	● Circuit(s) ● Turbocharger actuator ● Engine control module (ECM) ● Electrical connections and harnesses

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification

Symptom chart

Symptom	Possible source	Action
Poor performance	● Low/Contaminated fuel ● Restricted air intake system ● General engine condition ● ECM failure	Check the fuel level and condition. Check the air intake for restriction. Check the engine condition, compressions, etc. Check for DTCs. Refer to the warranty policy and procedures manual if an ECM is suspect.
No boost	● Electrical connections and harnesses ● Restricted air intake system ● Charge air cooler restricted/leaking ● Turbocharger actuator failure ● Turbocharger failure ● ECM failure	Check the electrical connections and harnesses. Check the air intake for restriction/leakage (see visual inspection). For air intake checks. Check the turbocharger actuator and circuits. Refer to the electrical guides. Check the turbocharger mechanical condition. Refer to the warranty policy and procedures manual if an ECM is suspect.
No boost/excessive noise	● Turbocharger failure	Disconnect the turbocharger intake and outlet pipework and turn the turbocharger by hand. Any roughness indicates a fault. Check any up and down movement in the turbocharger shaft. Excessive movement indicates a fault. If in doubt, compare the suspect unit with a new turbocharger.

DTC index

- NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to

the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: For a full list of powertrain DTCs, refer to workshop manual section 303-14 - Electronic Engine Controls.

OVERVIEW

Two variable vane Borg Warner turbochargers are fitted to the TDV8 engine, 1 to each exhaust manifold. Each turbocharger works independently from each other supplying air, via twin intercoolers, into the intake manifold. A balance pipe between each bank equalizes the pressure. Each turbocharger has its own electric motor to operate the vanes and is controlled by the Engine Control Module (ECM). The vane positions are varied to control the speed of the turbine wheel maintaining optimum boost pressure over a wide engine speed range and minimising turbo lag (turbo lag is a term used to describe the response time from the time the accelerator is pressed to the time when the turbocharger begins to affect performance), as seen with normal waste-gated turbochargers, during vehicle acceleration.

The exhaust turbine wheel is 39 mm diameter and the compressor wheel is 49 mm diameter. The turbine wheel is made from a high strength high temperature 'Inconel alloy' (a nickel-chromium alloy containing significant amounts of iron, niobium, and molybdenum along with lesser amounts of aluminum and titanium to combine corrosion resistance with high strength) and the compressor is high-grade aluminium alloy. The shaft assembly rotates at a maximum speed of 210,000 rpm to produce a charge air pressure of up to 1.7 bar with a pre-turbine pressure of 3 bar and 800°C (1472°F).

The position of the vanes are controlled by the ECM via a torque motor, lever and linkage rod. A feed back sensor in the motor continuously informs the ECM as to the position of the vanes during the turbochargers operation. If the vanes fail to reach the requested position an error code is generated known as a Diagnostic Trouble Code (DTC).

SYSTEM OPERATION

Item	Part Number	Description
A	-	Low engine speed
B	-	Moderate engine speed
C	-	Maximum engine speed
1	-	ECM
2	-	Actuator motor
3	-	Adjusting ring
4	-	Vanes
5	-	Turbine

A - Low Engine Speed

At low engine speeds the volume of exhaust gas is low so the vanes are moved towards the closed position to reduce the turbine inlet area. This reduction causes an increase in the gas velocity into the turbine wheel thereby increasing wheel speed and boost.

B - Moderate Engine Speed

As the engine speed increases and the volume of exhaust gas increases and the vanes are moved towards the open position to increase the turbine inlet area and maintain the gas velocity.

C - Maximum Engine Speed

At maximum engine speed the vanes are almost fully open maintaining the gas velocity into the turbine wheel.

Barometric Pressure Sensor

When the vehicle is driven at high altitudes the ambient pressure reduces causing the compressor wheel to do less work for the same boost pressure. To prevent the turbine wheel from over-speeding under these conditions a barometric pressure sensor, located in the ECM, protects the turbocharger by opening the vanes further to reduce the turbine wheel speed. This is known as the altitude margin of the turbocharger.

Turbocharger Lubrication

The rapid acceleration and deceleration response demands of the turbocharger rely greatly on a steady flow of clean oil. The oil supplied from the engine's lubrication system provides lubrication to the turbocharger's spindle and bearings, while also acting as a coolant for the turbocharger centre housing.

To maintain the life expectancy of the turbocharger, it is essential that the oil has a free-flow through the turbocharger and unrestricted return to the engines sump. It is therefore imperative that the engine oil is replenished at regular service intervals with the recommended quality and quantity of oil.

Charge Air Cooler

The charge air cooler is used to increase the density of air as it flows from the turbochargers compressor to the intake manifold.

Compression of the charge air by the turbochargers raises the temperature of the air. This generation of heat expands the air density and consequently less oxygen is able to enter the cylinders, reducing the engines power. To overcome this, the air is routed through the charge air cooler before it enters the engine; the temperature is reduced by transferring the heat to atmosphere.

Cooling of the intake air also helps to reduce engine emissions by limiting nitrogen oxides (NOx) production.

Diagnosis and Testing

Overview

The turbocharger system for this vehicle differs from previous models in that it uses twin turbochargers rather than a single unit serving both banks.

For information on the operation of the system:

Inspection and Verification

- WARNINGS:

⚠ The following tests may involve working in close proximity to hot components. Make sure adequate protection is used. Failure to follow this instruction may result in personal injury.

⚠ The turbocharger can continue to rotate after the engine has stopped. Do not attempt to check the turbocharger until one minute has elapsed since the engine was switched off. Failure to follow this instruction may result in personal injury.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection chart

Mechanical	Electrical
● Intake air system ● Hose(s)/hose connections ● Turbochargers ● General engine condition.	● Circuit(s) ● Electrical connections and harnesses ● Turbocharger actuators ● Engine control module (ECM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification

Symptom chart

Symptom	Possible source	Action
Poor performance (off-boost)	● Low/Contaminated fuel ● Restricted intake air system ● General engine condition ● Engine control module (ECM) failure	Check the fuel level and condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the intake air system for restriction. Check the engine condition, compressions, etc if there are indications of a mechanical fault. Check for DTCs indicating a module fault. Refer to the warranty policy and procedures manual if an ECM is suspect.
No boost	● Electrical connections and harnesses ● Restricted intake air system ● Charge air cooler restricted/leaking ● Turbocharger actuator failure(s) ● Turbocharger failure(s) ● Engine control	Check the electrical connections and harnesses. Check the intake air system for restriction/leakage. Check the turbocharger actuators and circuits. Refer to the electrical guides. Check the turbochargers for wear. Disconnect the turbocharger intake and outlet pipework and turn the turbochargers by hand. Any roughness indicates a fault. Check any up and down movement in the turbocharger shafts. Excessive movement indicates a fault. If in doubt, compare the suspect unit with a new turbocharger. Check for DTCs indicating an actuator or module fault. Refer to the warranty policy and procedures manual if an ECM is suspect.

Symptom	Possible source	Action
	module (ECM) failure	
No boost/excessive noise	- Turbocharger failure(s)	Disconnect the turbocharger intake and outlet pipework and turn the turbochargers by hand. Any roughness indicates a fault. Check any up and down movement in the turbocharger shafts. Excessive movement indicates a fault. If in doubt, compare the suspect unit with a new turbocharger.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

Removal and Installation

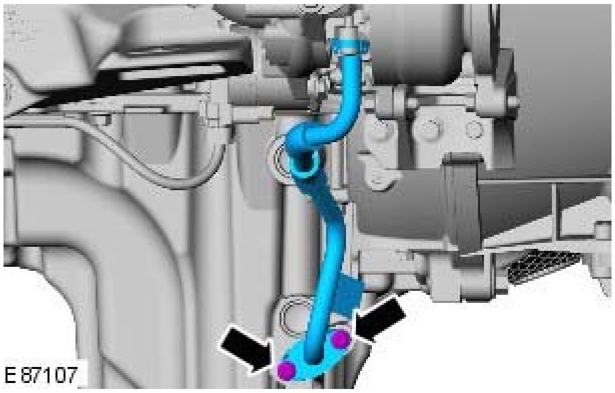
Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

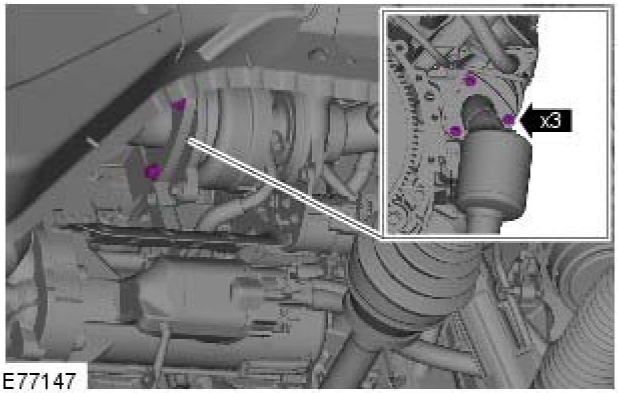


4. CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Release the LH turbocharger oil return tube.

- Remove and discard the gasket.
- Remove the 2 bolts.

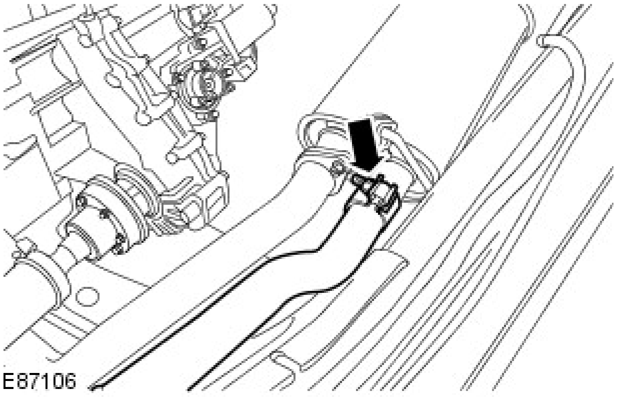
5. Remove the body.
For additional information, refer to: Body - TDV8 3.6L Diesel (502-02 Full Frame and Body Mounting, Removal and Installation).



6. NOTE: Right-hand shown, left-hand similar.

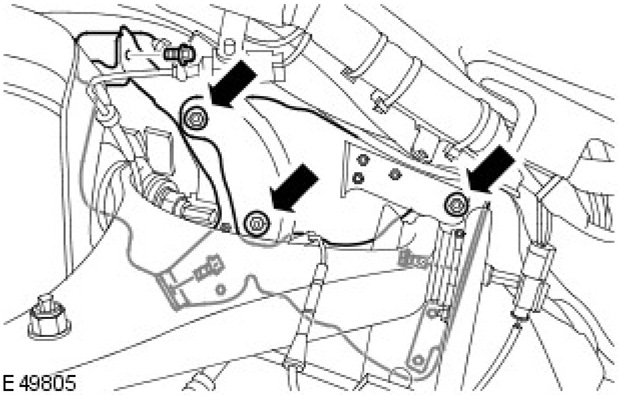
Release the exhaust system from the turbochargers.

- Remove the 6 bolts.
- Remove and discard the 2 gaskets.



7. Remove the LH catalytic converter.

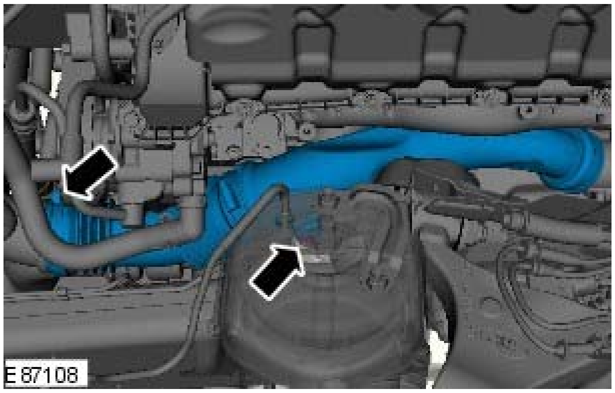
- Loosen the clamp.



8. NOTE: The heat shield consists of 3 parts.

Remove the upper suspension arm and brake line heat shields for access.

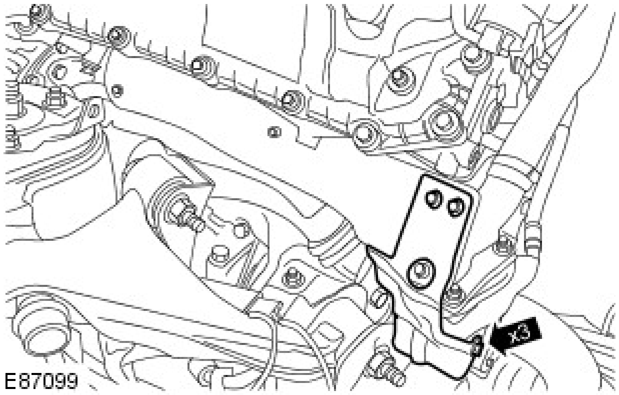
- Remove the 3 nuts.
- Remove the 3 bolts.
- Remove the bracket.



9. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

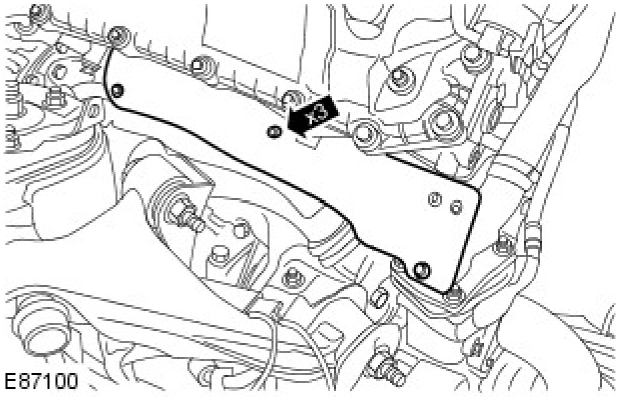
Remove the LH turbocharger intake tube.

- Remove the nut.
- Loosen the clip.



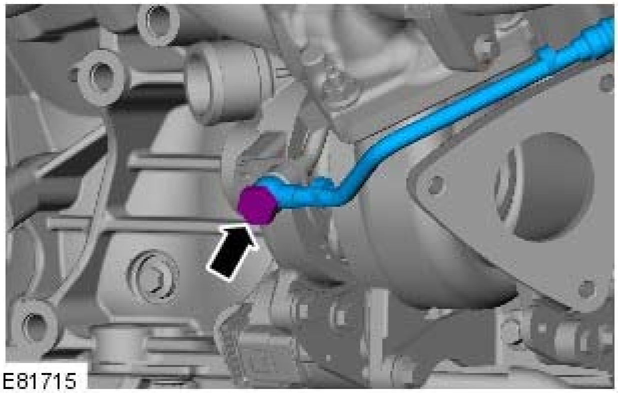
10. Remove the LH turbocharger heat shield.

- Remove the 3 bolts.



11. Remove the LH exhaust manifold heat shield.

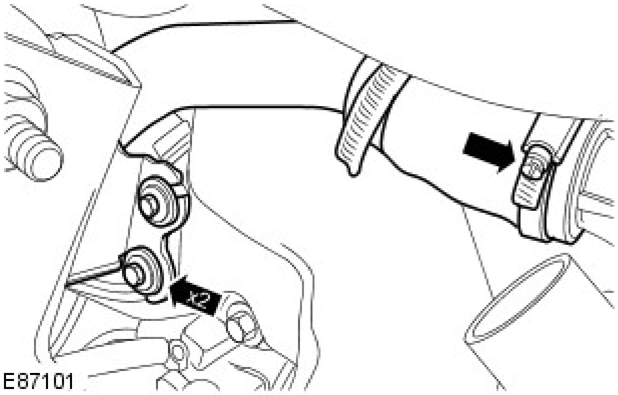
- Remove the 3 bolts.



12. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Disconnect the LH turbocharger oil supply pipe.

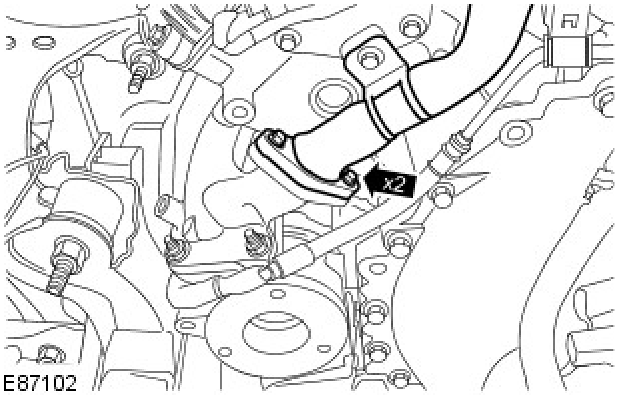
- Remove the banjo bolt.
- Remove and discard the 2 sealing washers.



13. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

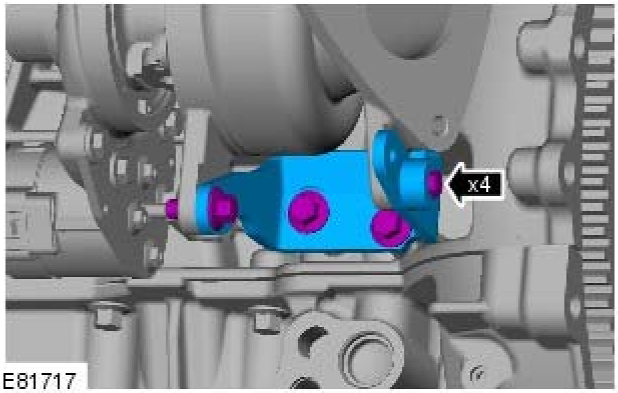
Reposition the LH turbocharger outlet pipe.

- Release the turbocharger outlet pipe clip.
- Remove the 2 bolts.



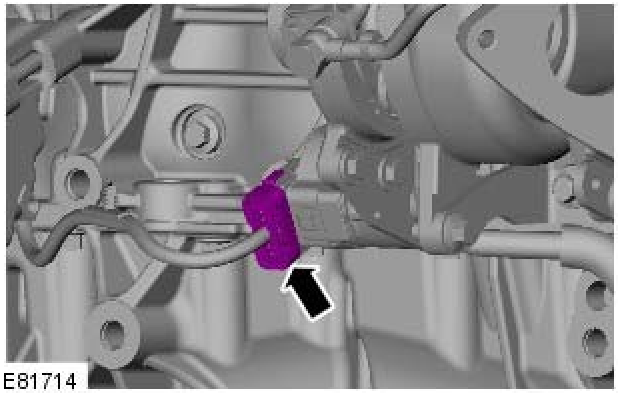
14. Release the LH exhaust gas recirculation (EGR) valve inlet tube.

- Remove the 2 bolts.
- Remove and discard the gasket.

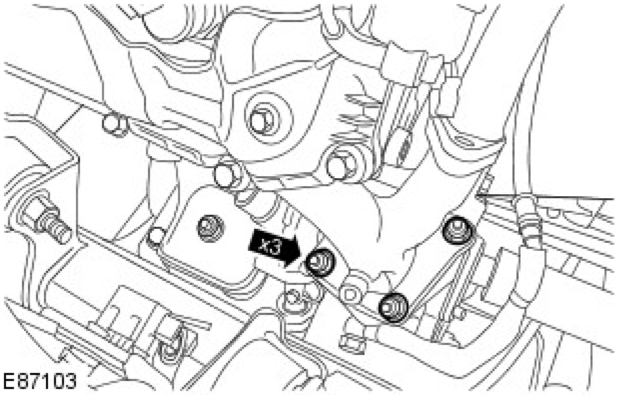


15. Remove the LH turbocharger support bracket.

- Remove the 4 bolts.

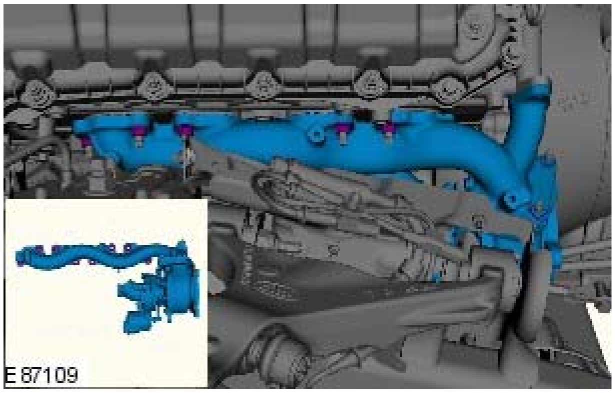


16. Disconnect the LH turbocharger electrical connector.



17. Release the LH turbocharger.

- Loosen the 3 nuts.



18. Remove the LH exhaust manifold and turbocharger assembly.

- Remove and discard the 8 nuts.
- Remove and discard the gasket.

19. CAUTIONS:

⚠ Make sure that the area around the component is clean and free of foreign material.

⚠ Make sure that all openings are sealed. Use new blanking caps.

Remove the turbocharger oil return tube.

- Remove the 2 bolts.
- Remove and discard the gasket.

20. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Remove the LH turbocharger.

- Remove the 3 nuts.
- Remove and discard the gasket.

Installation

1. NOTE: Remove and discard the blanking caps.

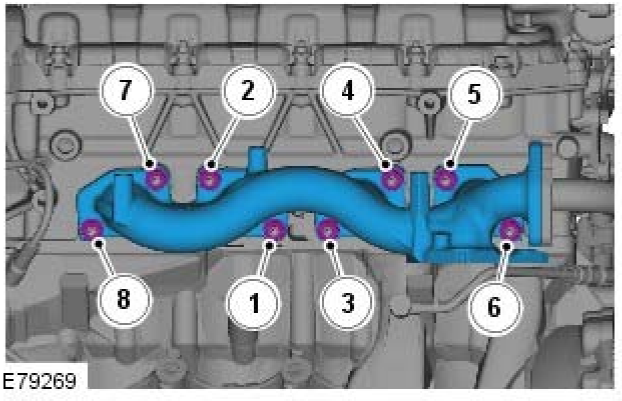
Install the LH turbocharger.

- Clean the component mating faces.
- Install a new gasket.
- Loosely install the nuts.

2. NOTE: Remove and discard the blanking caps.

Install the LH turbocharger oil return tube.

- Clean the component mating faces.
- Install a new gasket.
- Tighten the bolts to 10 Nm (7 lb.ft).



3. ⚠ CAUTION: To make sure that the exhaust manifold is correctly installed and the exhaust manifold nuts are correctly torqued, it is critical that the tightening torque is checked 2 further times after the initial torque has been applied.

• NOTE: Tighten the nuts in the sequence shown.

Install the LH exhaust manifold and turbocharger assembly.

- Clean the component mating face.
- Stage 1: Tighten the new nuts to 24 Nm (18 lb.ft).
- Stage 2: Wait for 2 minutes and tighten the nuts to 24 Nm (18 lb.ft).
- Stage 3: Wait for 2 minutes and tighten the nuts to 24 Nm (18 lb.ft).

4. Connect the LH turbocharger electrical connector.

5. ⚠ CAUTION: Install but do not fully tighten the turbocharger support bracket bolts. This will allow for movement of components during the final torque stages. Failure to follow this instruction may result in damage to the vehicle.

Install the LH turbocharger support bracket.

- Install the bolts.

6. Secure the LH turbocharger.

- Tighten the nuts to 24 Nm (18 lb.ft).

7. Secure the LH turbocharger support bracket.

- Stage 1: Tighten the LH turbocharger support bracket bolts at the cylinder block to 24 Nm (18 lb.ft).
- Stage 2: Tighten the LH turbocharger support bracket bolts at the turbocharger to 24 Nm (18 lb.ft).

8. Check tightness of the turbocharger nuts.

- Tighten the nuts to 24 Nm (18 lb.ft).

9. Secure the LH EGR valve inlet tube.

- Clean the component mating faces.
- Install a new gasket.
- Tighten the bolts to 10 Nm (7 lb.ft).

10. NOTE: Remove and discard the blanking caps.

Secure the LH turbocharger outlet pipe.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Tighten the clip.

11. NOTE: Remove and discard the blanking caps.

Connect the LH turbocharger oil supply pipe.

- Clean the component mating faces.
- Install new sealing washers.

- Tighten the banjo bolt to 24 Nm (18 lb.ft).

12. Install the LH exhaust manifold heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

13. Install the LH turbocharger heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

14. NOTE: Remove and discard the blanking caps.

Install the LH turbocharger intake tube.

- Tighten the nut to 10 Nm (7 lb.ft).
- Tighten the clip.

15. NOTE: The heat shield consists of 3 parts.

Install the upper suspension arm and brake line heat shields.

- Install the bolts.
- Install the nuts.
- Tighten to 6 Nm (4 lb.ft).

16. NOTE: Do not tighten the clamp at this stage.

Install the LH catalytic converter.

- Clean the component mating faces.
- Install a new gasket.
- Tighten the bolts to 25 Nm (18 lb.ft).

17. Secure the RH catalytic converter.

- Clean the components mating faces.
- Tighten the nuts to 25 Nm (18 lb.ft).

18. Secure the LH catalytic converter.

- Tighten the nut to 55 Nm (40 lb.ft).

19. Install the body.
For additional information, refer to: Body - TDV8 3.6L Diesel (502-02 Full Frame and Body Mounting, Removal and Installation).

20. NOTE: Remove and discard the blanking caps.

Secure the LH turbocharger oil return tube.

GENERAL

A single six-ribbed belt drives all the primary engine mounted accessories and a secondary double-sided eight-ribbed belt drives the engine driven cooling fan and the supercharger.

Both the primary and secondary belts are crankshaft driven via the torsional vibration damper. An automatic tensioner, located on the LH accessory-mounting bracket, keeps the belt at the correct tension. A deflection pulley on the RH accessory-mounting bracket increases the wrap angle around the generator pulley.

The torsional vibration damper incorporates compressed rubber between its inner and outer diameters to absorb vibration and shock loads.

The automatic tensioner consists of a deflection pulley on the end of a spring loaded pivot arm. The pivot arm can be turned counter-clockwise (viewed from the front of the engine) for removal and installation of the belt.

Diagnosis and Testing

Overview

There are two accessory drive belts on the supercharged engine and this section covers basic checks for both.

For ease of identification, the two belts are referred to as primary and secondary drive belts.

For additional information on the description and operation of the system, refer to the relevant workshop manual section.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical faults.

Symptom chart

Mechanical
● Primary drive belt condition (cracking/damage/contamination) ● Secondary drive belt condition (cracking/damage/contamination) ● Belt tension ● Pulley alignment ● Coolant pump ● Primary tensioner assembly ● Air conditioning compressor ● Power steering pump ● Crankshaft pulley ● Generator ● Dynamic response pump pulley ● Deflection pulley ● Supercharger pulley ● Secondary tensioner assembly ● Cooling fan pulley

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

⚠ CAUTION: If the engine is run without the accessory drive belts connected to eliminate driven components, diagnostic trouble codes, (DTCs) may be set which must be cleared before the vehicle is returned to the owner. The engine should not be run for more than 2-3 minutes with the belts disconnected. Failure to follow this instruction may result in damage to the vehicle.

GENERAL

A single six-ribbed belt drives all the primary engine mounted accessories and a secondary double-sided single eight-ribbed belt drives the engine driven cooling fan.

Both the primary and secondary belts are crankshaft driven via the torsional vibration damper. An automatic tensioner, located on the LH accessory-mounting bracket, keeps the belt at the correct tension. A deflection pulley on the RH accessory-mounting bracket increases the wrap angle around the generator pulley.

The torsional vibration damper incorporates compressed rubber between its inner and outer diameters to absorb vibration and shock loads.

The automatic tensioner consists of a deflection pulley on the end of a spring loaded pivot arm. The pivot arm can be turned counter-clockwise (viewed from the front of the engine) for removal and installation of the belt.

Diagnosis and Testing

Overview

There are 2 accessory drive belts on the supercharged engine and this section covers basic checks for both.

For ease of identification, the 2 belts are referred to as primary and secondary drive belts.

For additional information on the description and operation of the system, refer to the relevant workshop manual section.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical faults.

GENERAL

The engine crankshaft pulley drives the accessory components, which comprise the torsional vibration damper, generator, power steering pump, A/C compressor, Dynamic Response pump and coolant pump, via the accessory drive belt.

The belt, which is a maintenance free poly-V type belt, is automatically pre-loaded by the tensioning rollers and routed over deflection pulleys in order to maintain sufficient adhesion about the drive wheels. This ensures slip-free drive of the accessory components.

The engine crankshaft pulley drives the accessory components, which comprise the generator, power steering pump, A/C compressor, coolant pump and Dynamic Response pump, via one of two accessory drive belts.

The primary belt is an 8-ribbed, maintenance free poly-V type belt which is 28.5 mm wide. The secondary belt is a 6 rib, maintenance free poly-V type belt which is 21.4 mm wide. The belts are automatically pre-loaded by tensioners (one per belt) and routed over deflection idler pulleys in order to maintain sufficient grip between the belt and the driven pulleys. This ensures slip-free drive of the accessory components.

The poly-V type belts are designed to achieve fit-for-life performance through normal use (due to the risk of off-road stone damage, the belt is inspected periodically and, if necessary, replaced. Refer to the vehicles service schedule for more information). The belts unique rib profile provides higher dimensional accuracy, whilst the surface of the ribs themselves have been specially treated to reduce noise.

Engine durability during wading is protected by sealed bearings on the belt idlers and tensioners. The generator, A/C compressor and starter motor are also fully sealed.

Diagnosis and Testing

Overview

There is an additional drive belt on diesel engines for the fuel injection pump, this section covers basic checks for both.

For information on the description and operation of the system:
REFER to: Accessory Drive (303-05D Accessory Drive - TDV8 3.6L Diesel, Description and Operation).

Inspection and verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical faults.

Visual inspection

Mechanical
● Drive belt condition (cracking/damage/contamination) ● Idler assembly ● Generator ● Engine cooling fan ● Tensioner assembly ● Engine coolant pump ● Power steering pump ● Air conditioning (A/C) compressor ● Torsional vibration damper ● Dynamic response pump ● Tensioner assembly ● Accessory drive belt ● Security/Correct fitment of the fuel injection pump cover ● Fuel injection pump belt condition (cracking/damage/contamination) ● Fuel injection pump belt tensioner assembly ● Fuel injection pump ● Fuel injection pump belt

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

⚠ CAUTION: If the engine is run without the accessory drive belts connected to eliminate driven components, diagnostic trouble codes, (DTCs) may be set which must be cleared before the vehicle is returned to the owner. The engine should not be run for more than 2-3 minutes with the belts disconnected. Failure to follow this instruction may result in damage to the vehicle.

4. **4.** Use the approved diagnostic system or a scan tool to retrieve any DTCs before moving onto the symptom chart or DTC index.
    - ○ Make sure that all DTCs are cleared following rectification.

Check for diagnostic trouble codes (DTCs) indicating a pump malfunction.
Drive belt does not hold tension	- Belt condition - Tensioner fault	Check the belt condition (see visual inspection). Check the tensioner function. Rectify as necessary.
Loss of drive (with no drive to the fuel injection pump, the engine will not run)	- Belt broken/stripped teeth - Drive pulleys loose	Investigate the cause of the belt breakage/damage (a belt broken at a 45 degree angle normally indicates a shear, a break straight across the belt normally indicates that the belt has been crimped). Check for DTCs indicating a pump malfunction.

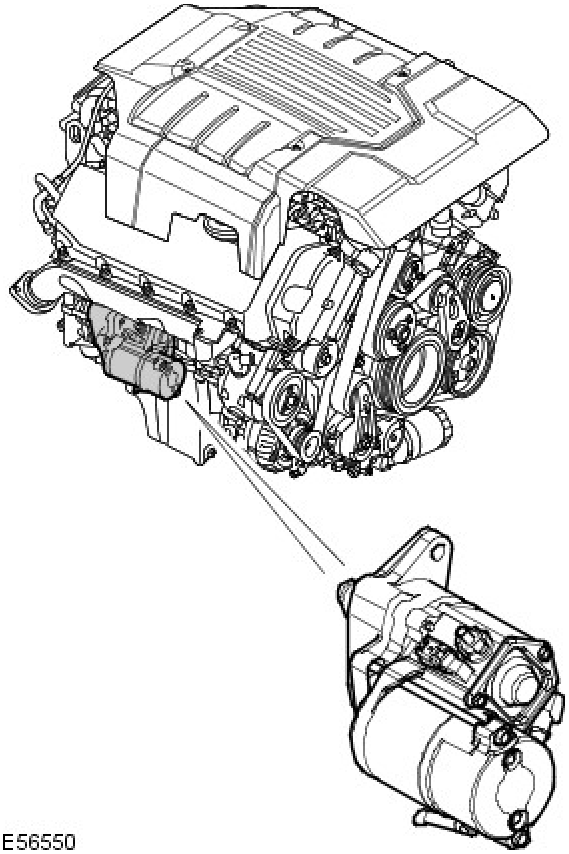
Description and Operation



E56550

GENERAL

The starter motor is rated as a 1.8kW and is a Denso level three-sealed unit. It is an RA type starter motor, which is of the offset design with the solenoid being directly behind the pinion to give a more positive engagement to the ring gear. The motor is geared directly to the pinion. Each starter motor is of the pre-engaged type and comprises a series wound motor and an overrunning clutch. This starter incorporates labyrinth-breathing tubes to help with sealing and drainage.

The starter solenoid is energised by a signal from the Engine Control Module (ECM) when the ignition switch is moved to the crank position. When engine cranking is requested, the ECM checks that a valid key code has been received before granting the crank request.

The power for starter operation is supplied on a substantial single cable connected direct from the battery positive terminal. The cable is connected to the solenoid via a copper threaded stud with an anti-rotational device and secured with a nut.

The starter motor is located on the rear RH side of the engine block. The motor is secured to the block and protrudes through an aperture to drive the flywheel via a ring gear.

Description and Operation

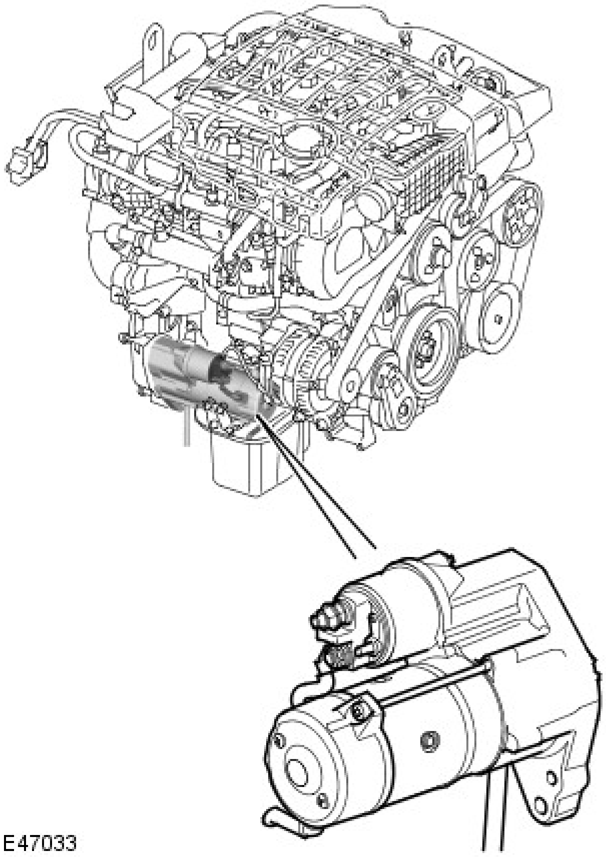
GENERAL



The starter motor is rated as 2.0 kW and is a Denso level three-sealed unit. It is a P76S type starter motor and is of conventional design with the motor in line and the drive pinion and solenoid mounted above. Each starter motor is of the pre-engaged type and comprises a series wound motor, an overrunning clutch and an integral solenoid. This starter incorporates labyrinth-breathing tubes to help with sealing and drainage.

The starter solenoid is energised by a signal from the Engine Control Module (ECM) when the ignition switch is moved to the crank position. When engine cranking is requested, the ECM checks that a valid key code has been received before granting the crank request. The power for starter operation is supplied on a substantial single cable connected direct from the battery positive terminal. The cable is connected to the solenoid via a copper threaded stud and secured with a nut.

The starter motor is located on the rear RH side of the engine block and protrudes through an aperture to drive the flywheel via a ring gear. The motor is secured to the cylinder block by two bolts and to the ladder frame by four bolts and a support bracket. The bracket provides crucial support for the starter motor and must not be omitted when installing or reinstalling the unit.

Removal and Installation

Removal

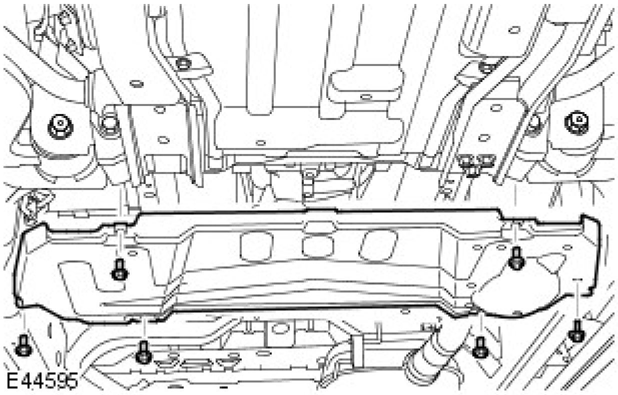
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the transmission undershield.

- Remove the 6 bolts.

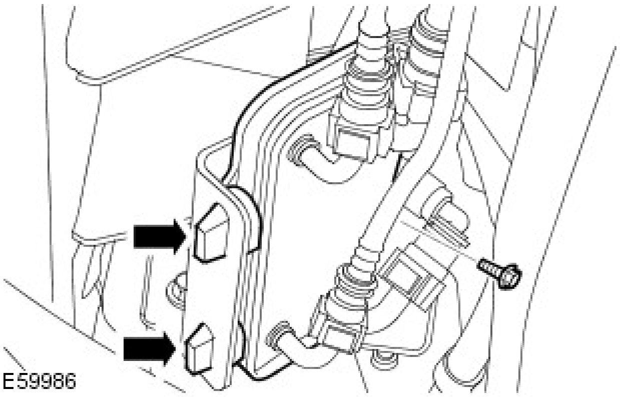


4. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

5. NOTE: Note the fitted position of the rubber mounts.

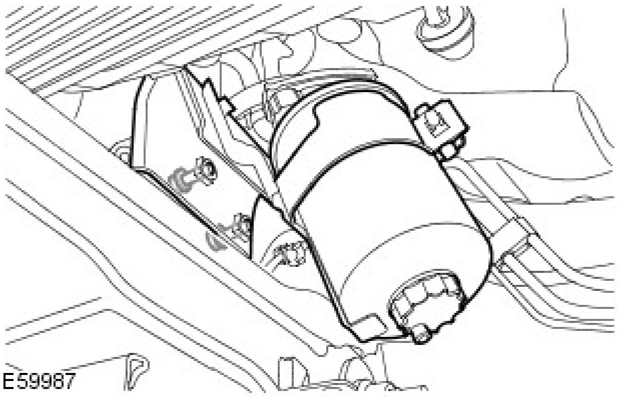
Release the fuel cooler.

- Remove the retaining bolt.

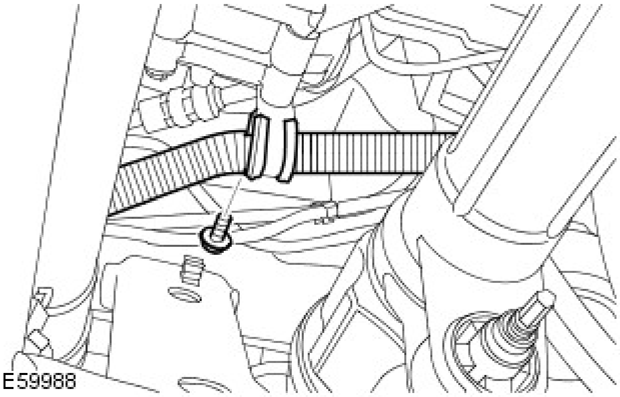


6. Release the fuel filter housing and support bracket.

- Remove the two retaining bolts.

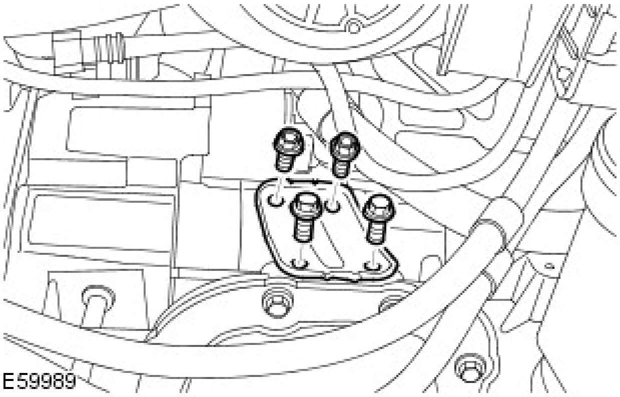


7. Reposition the fuel cooler and the fuel filter housing and support bracket.



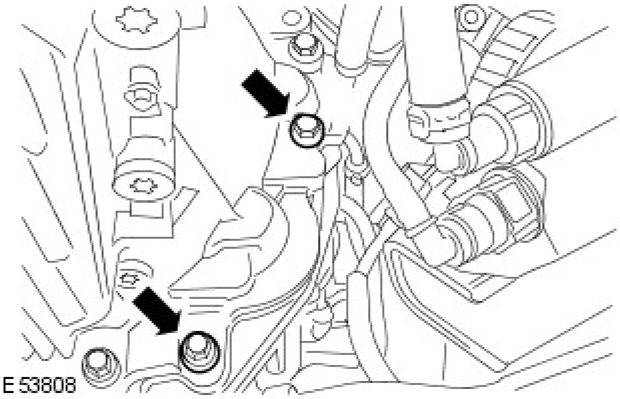
8. Release the battery positive cable.

- Remove the clip retaining bolt.



9. Remove the starter motor support bracket.

- Remove the four retaining bolts.



10. Release the starter motor.

- Remove the two retaining bolts.

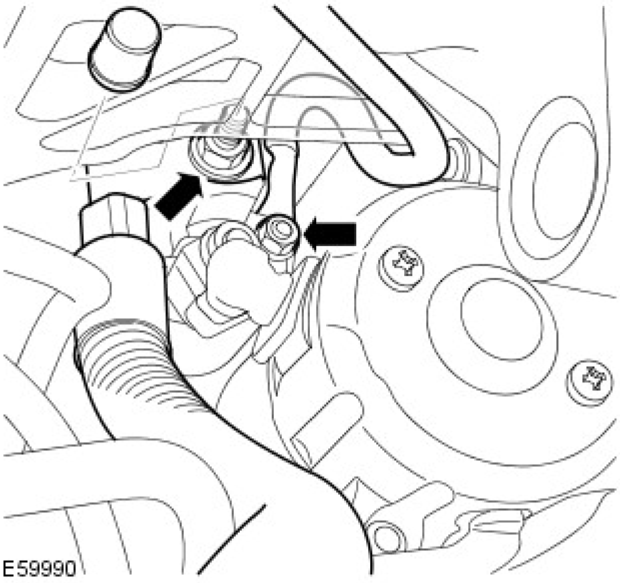
11. Disconnect the battery positive cable from the starter motor solenoid.

- Remove the terminal nut insulator.
- Remove the nut.

12. Disconnect the switch lead from the starter motor solenoid.

- Remove the integral connector nut.

13. Remove the starter motor.



Installation

1. Install the starter motor.

- Clean the component mating faces.

2. ⚠CAUTION: Damage to internal components will result if this torque is exceeded.

Connect the battery positive cable and the switch lead to the starter motor solenoid.

- Tighten the integral connector nut to 8 Nm (6 lb.ft).
- Tighten the battery positive lead nut to 11 Nm (8 lb.ft).
- Install the terminal nut insulator.

3. Install the starter motor retaining bolts.

- Tighten the bolts to 48 Nm (35 lb.ft).

4. Secure the battery positive cable.

- Align the clip.
- Tighten the bolt to 22 Nm (16 lb.ft).

5. Install the starter motor support bracket.

- Install the 4 bolts and tighten to 10 Nm (7 lb.ft).

6. Reposition the fuel cooler and the fuel filter housing and support bracket.

7. Attach the fuel filter support bracket.

- Tighten the bolts to 10 Nm (7 lb.ft).

8. ⚠ CAUTION: Make sure the rubber mounts are installed correctly.

Attach the fuel cooler.

- Install the bolt and tighten to 10 Nm (7 lb.ft).

9. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

10. Install the transmission undershield.

- Tighten the bolts to 10 Nm (7 lb.ft).

11. Connect the battery ground cable.

Diagnosis and Testing

Overview

For information on the operation of the system:
REFER to: Starting System (303-06D Starting System - TDV8 3.6L Diesel, Description and Operation).

Inspection and verification

1. **1.** Verify the customer concern.

2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
- Gear selector lever cable adjustment (vehicles with automatic transmission) - Starter motor - Engine (turns freely)	- Battery - Fuses - Link 14E, engine compartment junction box - Megafuse - Starter relay - Wiring harness(es) - Damaged, loose or corroded connectors - Ignition switch - Generator - Engine control module (ECM) - Transmission control module (TCM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom chart

Symptom	Possible causes	Action
The engine does not crank (starter motor does **not** turn)	- Gear selector not in **P** or **N** position (vehicles with automatic transmission) - Battery - Starter relay - Output circuit: high resistance - Output circuit: short circuit to power - Invalid key code received by central junction box (CJB) - Harness/Connectors - Starter motor - Ignition switch - Generator - Engine seized	Make sure the gear selector is in the **P** or **N** position and correctly adjusted. REFER to: Selector Lever Cable Adjustment (307-05A Automatic Transmission/Transaxle External Controls - V8 S/C 4.2L Petrol, General Procedures), Selector Lever Cable Adjustment (307-05B Automatic Transmission/Transaxle External Controls - V8 4.4L Petrol, General Procedures), Selector Lever Cable Adjustment (307-05D Automatic Transmission/Transaxle External Controls - TDV8 3.6L Diesel, General Procedures). Check the battery condition and state of charge. Check for DTCs indicating an immobilizer fault. Check the starter motor relay, ignition switch and generator circuits. Refer to the electrical guides. Check that the engine turns freely.
The engine does not crank (starter motor **does** turn)	- Starter motor fitment - Starter motor - Flywheel/Drive plate ring gear	Check the starter motor fitment (fasteners tight, starter motor square to engine, etc). Check the flywheel/drive plate ring gear teeth for damage, foreign objects, etc.
Engine cranks too slowly	- Battery - Harness/Connectors - Starter motor - Oil grade	Check the battery condition and state of charge. Check the starter motor circuits. Refer to the electrical guides. Check the engine oil grade and condition.

Symptom	Possible causes	Action
Engine cranks too fast	- Low engine compression	Check the engine condition and compressions.
Excessive starter motor noise	- Starter motor - Flywheel/Drive plate ring gear - Starter motor fitment/casing	Check the starter motor fitment (fasteners tight, motor square to engine, etc). Check the starter motor casing condition. Check the flywheel/drive plate ring gear teeth for damage, foreign objects, etc.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

GENERAL

The 4.2L engine ignition system has a single iridium tipped spark plug per cylinder, with each spark plug powered by an on-plug ignition coil. The ignition coils are directly driven by the engine control module (ECM).

Power for the ignition coils is supplied from the main relay and a fuse in the battery junction box (BJB). A capacitor is connected in parallel with the power supplies to the ignition coils to suppress RFI (radio frequency interference).

Each ignition coil contains a power stage to switch the current in the primary circuit. The ECM controls the switching with a signal to the power stage. The ECM monitors operation of the ignition coils using a feedback signal from each of the power stages. If a fault is detected the ECM stores an appropriate fault code.

The ECM varies the dwell time of the ignition coils depending on battery voltage and engine speed, to ensure a constant energy level is produced in the secondary coil each time the power stage is switched. This ensures a good spark is always produced by the spark plug without excessive primary current flow, thus avoiding overheating or damage to the ignition coils.

The ECM calculates the ignition timing for individual cylinders from:

- Engine speed.
- Camshaft position.
- Engine load.
- Engine temperature.
- The knock control function.
- The shift control function.
- The idle speed control function.

GENERAL

The 4.4L engine ignition system has a single iridium tipped spark plug per cylinder, with each spark plug powered by an on-plug ignition coil. The ignition coils are directly driven by the engine control module (ECM).

Power for the ignition coils is supplied from the main relay and a fuse in the battery junction box (BJB). A capacitor is connected in parallel with the power supplies to the ignition coils to suppress RFI (radio frequency interference).

Each ignition coil contains a power stage to switch the current in the primary circuit. The ECM controls the switching with a signal to the power stage. The ECM monitors operation of the ignition coils using a feedback signal from each of the power stages. If a fault is detected the ECM stores an appropriate fault code.

The ECM varies the dwell time of the ignition coils depending on battery voltage and engine speed, to ensure a constant energy level is produced in the secondary coil each time the power stage is switched. This ensures a good spark is always produced by the spark plug without excessive primary current flow, thus avoiding overheating or damage to the ignition coils.

The ECM calculates the ignition timing for individual cylinders from:

- Engine speed.
- Camshaft position.
- Engine load.
- Engine temperature.
- The knock control function.
- On automatic transmission models, the shift control function.
- The idle speed control function.

Diagnosis and Testing

Overview

For information on the operation of the system, refer to the relevant workshop manual section.

Inspection and verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
● Engine oil level ● Cooling system coolant level ● Fuel level ● Fuel contamination/grade/quality ● Exhaust gas recirculation (EGR) valves	● Fuses ● Wiring harness ● Loose or corroded electrical connectors ● Ignition coils ● Sensor(s) ● Engine control module (ECM) ● Transmission control module (TCM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

GENERAL

The glow plug system has a glow plug installed in the inlet side of each cylinder. The glow plugs heat the combustion chambers before and during cranking, to aid cold starting, and after the engine starts to reduce emissions and engine noise when idling with a cold engine.

A glow plug wiring harness on each bank of glow plugs is connected to a separate relay and fusible link in the battery junction box (BJB). The individual glow plugs are grounded through their fixing in the cylinder head. Operation of the glow plug relays is controlled by the engine control module (ECM), which also controls the illumination of the glow plug indicator in the instrument cluster.

Each glow plug is a tubular heating element which contains a spiral filament encased in magnesium oxide powder. At the tip of the tubular heating element is the heater coil. Behind the heater coil, and connected in series, is a control coil. The control coil regulates the current to the heater coil to ensure that it does not overheat.

SYSTEM OPERATION

There are three phases of glow plug heating: Pre heating, crank heating and post heating. The ECM determines the heating times from the engine coolant temperature (ECT). The lower the ECT, the longer the heating times.

When the ignition switch is turned to position II, the ECM calculates any required heating times and, if heating is required, energizes the glow plug relays in the BJB. When pre heating is required, the ECM also sends a message to the instrument cluster, on the high speed controller area network (CAN) bus, to request illumination of the glow plug indicator. The glow plug indicator remains illuminated for the duration of the pre heating phase, or until the ignition switch is turned to the crank position, whichever occurs first. If required, the ECM keeps the glow plug relays energized during cranking and for the duration of any post heating phase.

The ECM monitors the drive circuit of the glow plug relays for plausibility of operation, continuity, and short and open circuits. If a fault is detected, the ECM stores a related fault code and permanently illuminates the glow plug indicator while the ignition switch is in position II.

Overview

This section covers the basic checks for the engine breather system on the supercharged engine.

For information on the operation of the emission control systems, refer to relevant workshop manual section.

Inspection and verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical faults.

Visual Inspection Chart

Mechanical
● Engine breather hoses ● Oil separators ● Positive crankcase ventilation valve

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart.
    - Make sure that all DTCs are cleared following rectification.

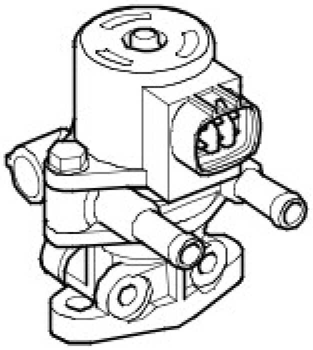
1	-	Full load tube
2	-	Pressure Control Valve (PCV)
3	-	Part load tube
4	-	EGR tube
5	-	EGR valve
6	-	Electric throttle

The exhaust gas recirculation (EGR) system is controlled by a PWM signal from the engine control module (ECM). The system comprises an EGR valve and a gas transfer pipe.



E48518

The EGR valve is a 4 pole 60 point stepper motor with an integral cooler unit which is mounted on the side of the induction elbow. The EGR valve receive four 12 Volt signals from the ECM. The EGR valve is cooled by the return coolant flow from the electric throttle.

The EGR valve is connected to the LH exhaust manifold via the gas transfer pipe.

CRANKCASE VENTILATION

The V8 engine is ventilated through a part load and a full load breather.

The part load breather is a flexible composite hose connected between the positive crankcase ventilation (PCV) valve mounted above the oil separator in the bank A camshaft cover and the induction elbow. The PCV valve prevents reverse flow into the crankcase.

Item	Part Number	Description
1	-	intake air temperature (IAT) sensor
2	-	Electric throttle body
3	-	Electric throttle flap
4	-	Electric throttle control motor
5	-	Gas inlet port

The combined EGR modulator and cooler is located under each cylinder bank, between the exhaust manifold and the cylinder head. The cooler side of the EGR is connected to the vehicle cooling system, via hoses. The inlet exhaust side is connected directly into the exhaust manifolds on each side. The exhaust gas passes through the cooler and is expelled via the actuator and a metal pipe into the throttle housing. The EGR modulator is a solenoid operated valve which is controlled by the engine control module

(ECM). The ECM uses the EGR modulator to control the amount of exhaust gas being recirculated in order to reduce exhaust emissions and combustion noise. The EGR is enabled when the engine is at normal operating temperature and under cruising conditions.

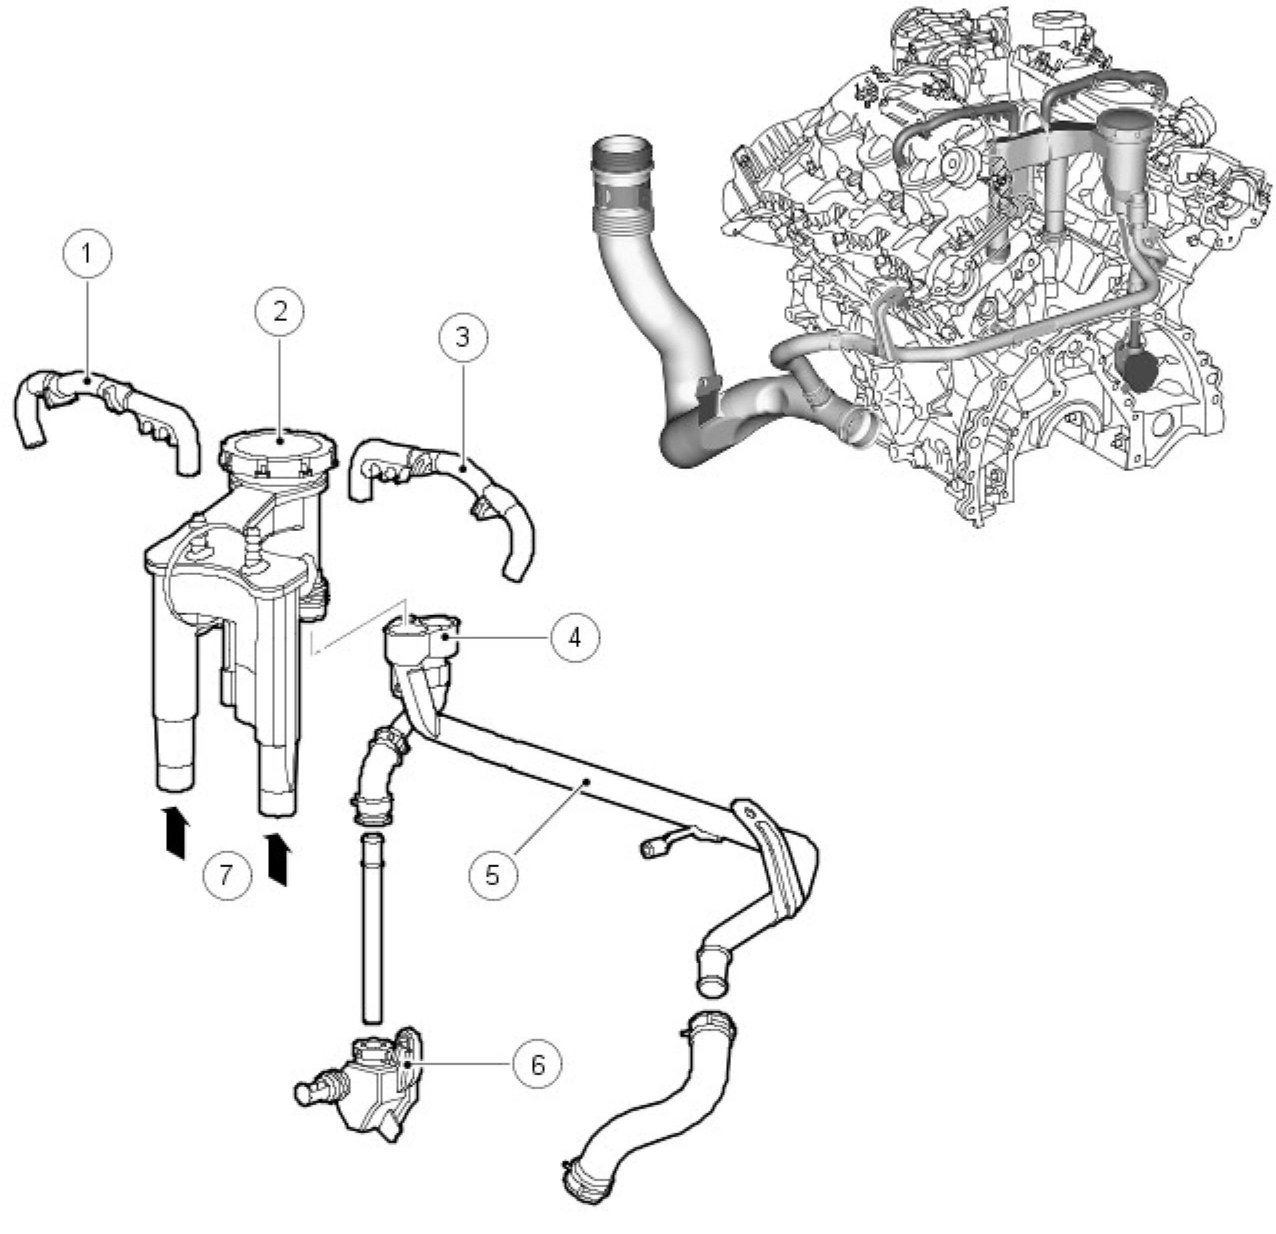
On vehicles from 2007MY, a flow regulating, wax thermostat is fitted to the coolant outlet of the EGR cooler. The purpose of the thermostat is to promote faster engine warm-up, improve cabin heater performance and assist the emissions to comply with the requirements of EU4 regulations. The thermostat is closed when cold, starts to open at 75°C (167°F) and is fully open at normal operating temperatures. The thermostat has a small bleed hole which allows a small amount of leakage when cold.

The EGR modulator receives a 12V supply from the main relay. The ground for the solenoid is via the ECM and is controlled using a pulse width modulation (PWM) signal. The PWM duty signal of the solenoid ground is varied to determine the precise amount of exhaust gas delivered to the cylinders.

The modulators are operated through their full range at each engine start-up, to clear any carbon deposits that may have built up whilst the engine was running

In the event of a failure of the EGR modulator, the EGR function will become inoperative. The ECM can monitor the EGR modulator solenoid for short circuits and store fault codes in the event of failure. The modulator can also be activated for testing using T4.

CRANKCASE VENTILATION



E48445

Item	Part Number	Description
1	-	Breather tube
2	-	Oil separator
3	-	Breather tube
4	-	Crankcase oil return connection
5	-	Oil return tube
6	-	Crankcase oil return valve
7	-	Breather flow

The crankcase ventilation system on the TdV6 ensures that all gasses emitted from the crankcase during engine running are separated from any oil particles.

Crankcase gasses are drawn into the oil separator unit from the crankcase and the cylinder head covers (both banks) where the gas and oil are separated. The gas is returned to the inlet side of the air induction system prior to the turbo charger. The oil is drained down to the sump via an oil return valve locate at the rear of the cylinder block.

If the value has increased by more than 80% per 10 ms, recheck the circuits. If no fault is found in the circuits, install a new EGR valve. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P214100	Exhaust Gas Recirculation Throttle Control Circuit A Low	● EGR sensor circuits short circuit (to ground/power/other circuits ● EGR sensor circuits high resistance ● EGR sensor fault	Check the EGR sensor circuits. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation. Using a datalogger function, read the difference between the EGR throttle set point and the actual throttle position, and the EGR throttle position. Check that the throttle is open and command the throttle closed. Check that the throttle position value increases to above 90%. Check the difference between set point and actual. This value should not exceed either maximum 5% or minimum -15%. Check that the EGR throttle is not sticking. Install a new right-hand valve as necessary. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P214200	Exhaust Gas Recirculation Throttle Control Circuit A High	● EGR sensor circuits short circuit (to ground/power/other circuits ● EGR sensor circuits high resistance ● EGR sensor fault	Check the EGR sensor circuits. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation. Using a datalogger function, read the difference between the EGR throttle set point and the actual throttle position, and the EGR throttle position. Engine Emission Control - TDV6 2.7L Diesel - Crankcase Vent Oil Separator

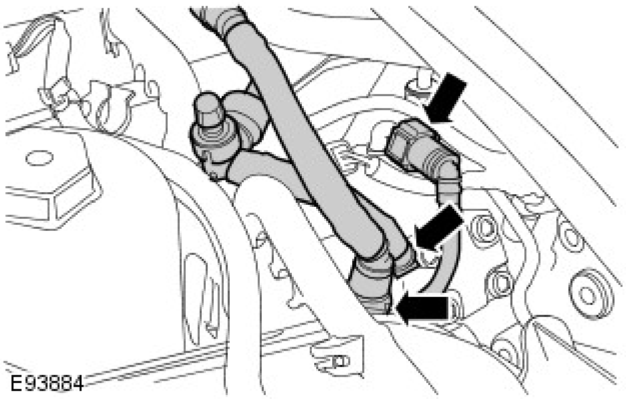
Removal and Installation

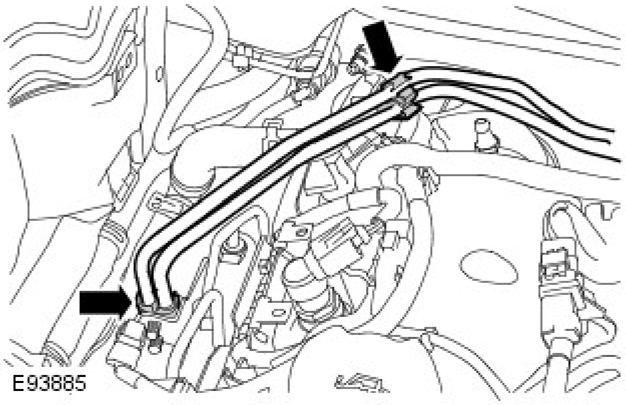
Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the intake air shutoff throttle.
   For additional information, refer to: Intake Air Shutoff Throttle (303-04C Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

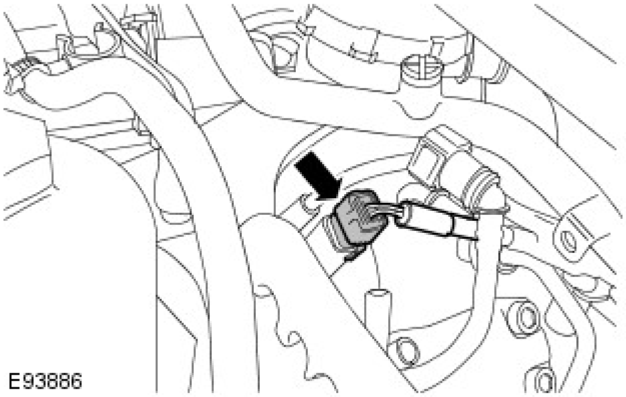


3. ⚠ CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

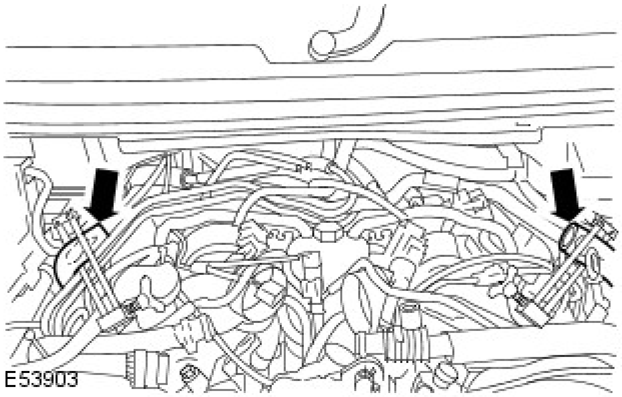
   Disconnect the low-pressure fuel lines.



4. Release the 2 fuel lines.
   - Release from the 4 clips.

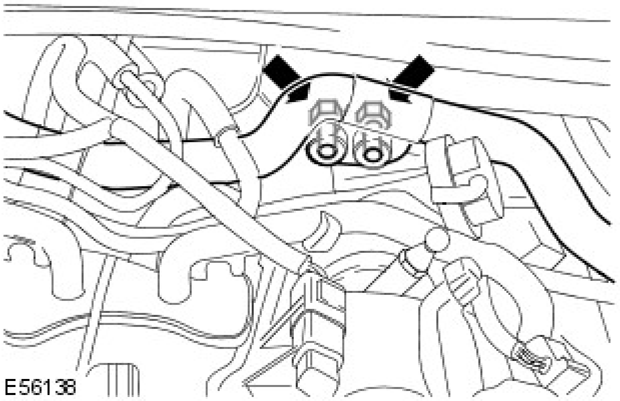


5. Disconnect the fuel high-pressure pump electrical connector.



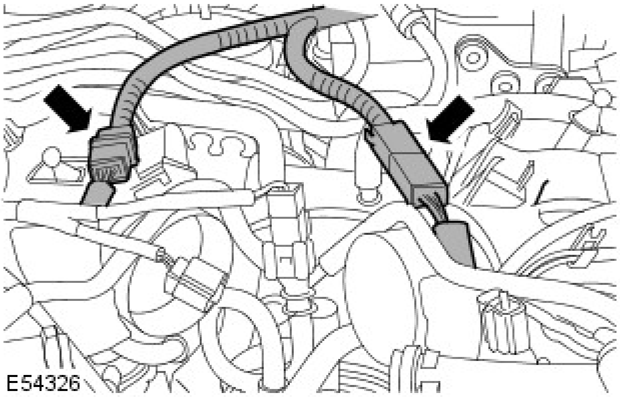
6. Disconnect both exhaust gas recirculation (EGR) coolant cross-over pipe hoses.

- Clamp the EGR coolant hoses to minimize coolant loss.



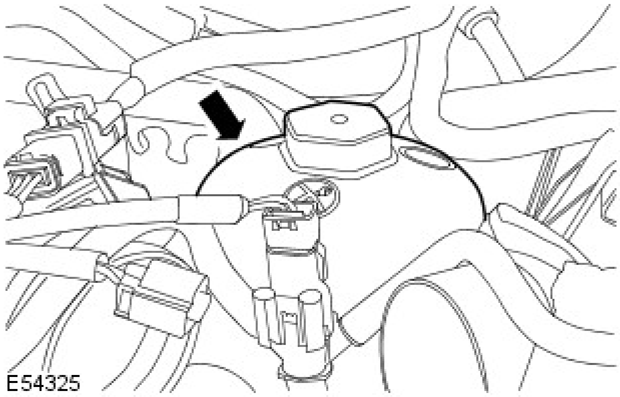
7. Remove the EGR coolant cross-over pipe.

- Remove the two retaining bolts.



8. Disconnect the glow plug electrical connectors.

- Release from the 2 clips.



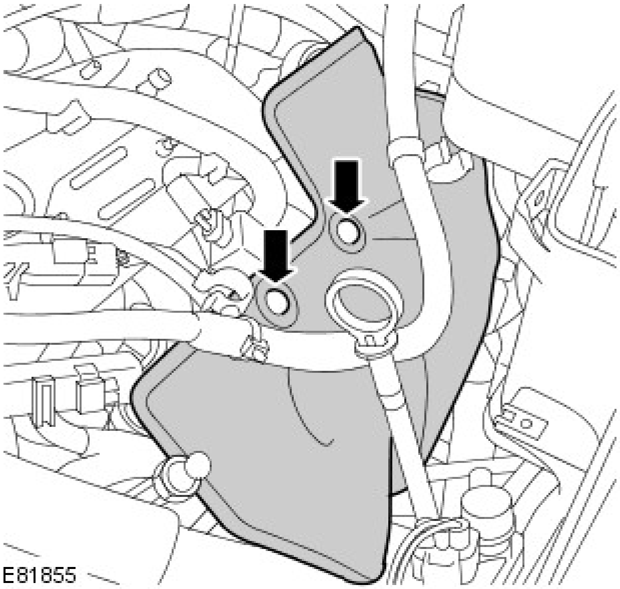
9. CAUTIONS:

⚠ Ensure any open connections are plugged to prevent contamination.

⚠ The O-ring seal is to be reused unless damaged.

Remove the oil filter cover and oil filter element.

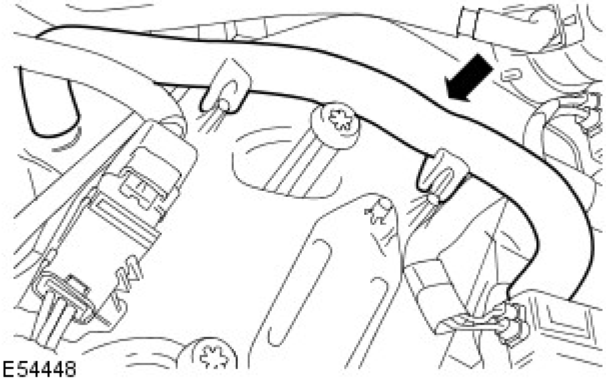
- Loosen the element cover 4 complete turns to allow engine oil to drain from the filter cover.
- Remove element cover.
- Clean the immediate area.



10. NOTE: Left-hand shown, right-hand similar.

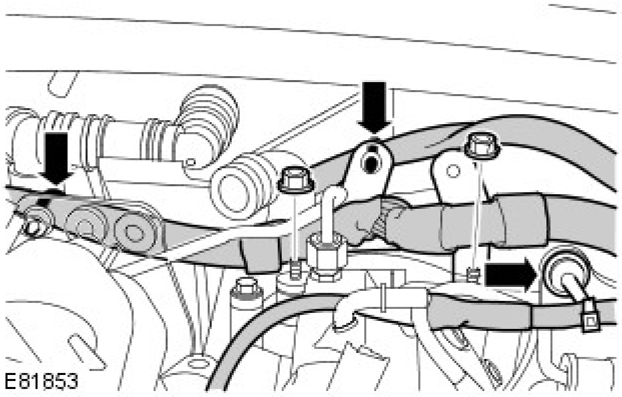
Remove the injector sound proofing.

- Remove the 4 clips.



11. NOTE: Left-hand shown, right-hand similar.

Remove the breather pipes.

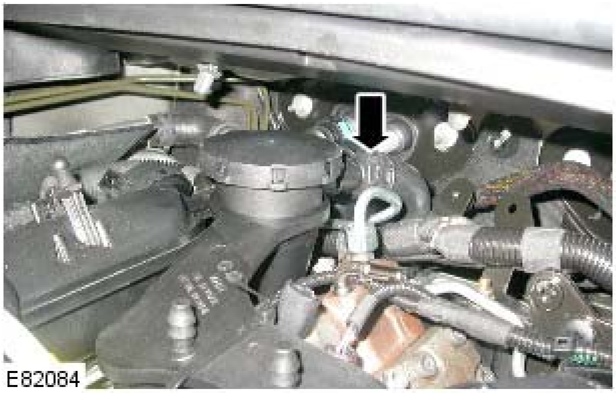


12. Release the fuel charging wiring harness.

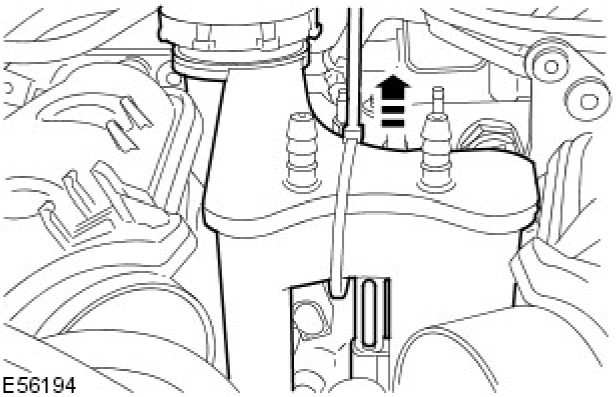
- Release the 3 clips.
- Remove the 2 nuts.

13. Disconnect the engine breather line.

- Release the clip.

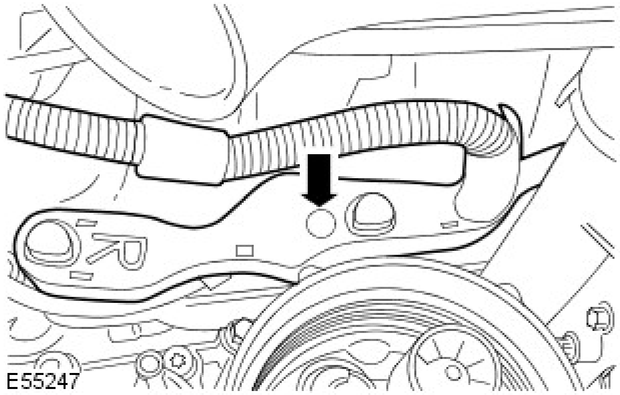


14. Release the crankcase vent oil separator.



15. NOTE: Right-hand shown, left-hand similar.

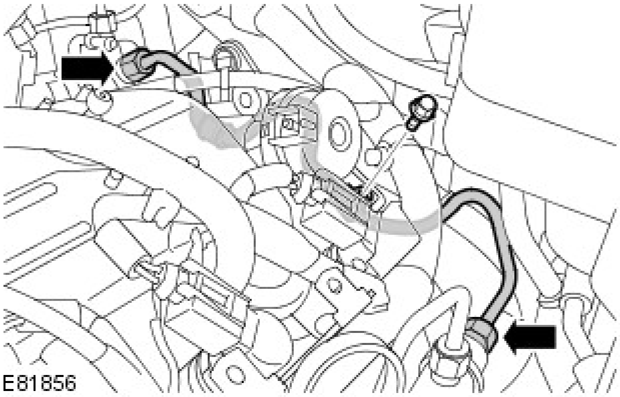
Remove the glow plug wires.



16. NOTE: Left-hand shown, right-hand similar.

Release the high-pressure fuel supply lines.

- Remove the bolt.



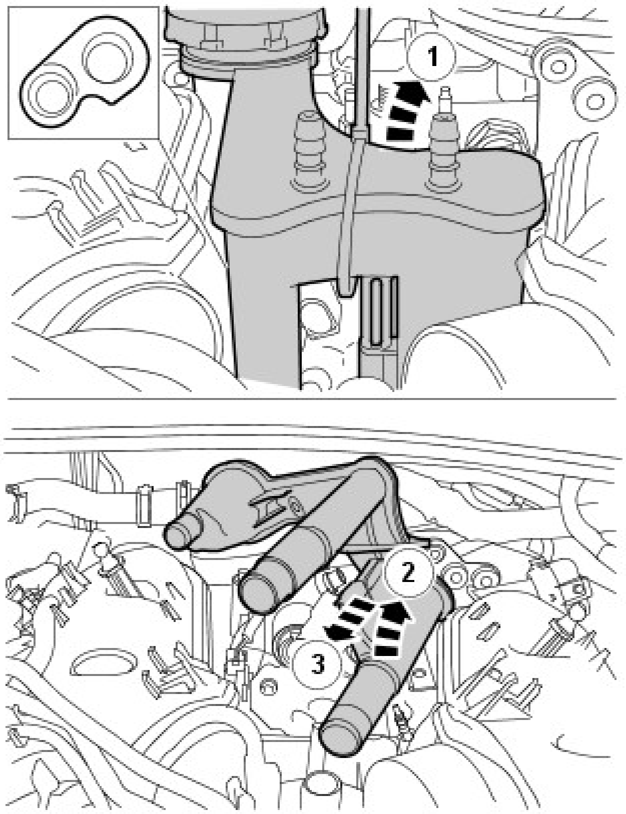
E81856

17. CAUTION: Make sure that the high-pressure fuel supply line remains in contact with the fuel injection supply manifold and the fuel injection pump until both unions have been detached and cleaned. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

• NOTE: Left-hand shown, right-hand similar.

Remove and discard the high-pressure fuel supply lines.

- Install blanking caps to the exposed ports.



E93887

18. CAUTIONS:

Always plug any open connections to prevent contamination.

The O-ring seals are to be reused unless damaged.

Remove the crankcase vent oil separator.

Installation

1. WARNING: Before installing the components, ensure the area around the joint faces and connections are clean.

CAUTION: The O-ring seals are to be reused unless damaged.

Position the crankcase vent oil seperator, but do not fully install at this stage.

2. WARNING: Before installing the components, ensure the area around the joint faces and connections are clean.

Install the new high-pressure fuel rail supply lines and line clips.

- Loosely install the new high-pressure fuel rail supply lines.

- Stage 1: Tighten the high-pressure fuel supply line union at the fuel pump to 15 Nm (11 lb.ft).
- Stage 2: Tighten the high-pressure fuel supply line union at the fuel injection rail to 15 Nm (11 lb.ft).
- Stage 3: Tighten the high-pressure fuel supply line union at the fuel pump to 30 Nm (22 lb.ft).
- Stage 4: Tighten the high-pressure fuel supply line union at the fuel injection rail to 30 Nm (22 lb.ft).
- Tighten the clip screws to 10 Nm (7 lb.ft).

3. Install the glow plug wires.

4. Install the crankcase vent oil separator.

5. Connect and secure the engine breather line.

6. Install the injector sound proofing.

- Secure the 4 clips.

7. Install the EGR coolant cross-over pipe.

- Install the two retaining bolts.
- Tighten to 13 Nm (10 lb.ft).

8. Connect both EGR coolant cross-over pipe hoses.

- Remove the EGR coolant hose clamps.

9. Secure the fuel charging wiring harness.

10. Connect the fuel high-pressure pump electrical connector.

11. Install the breather pipes.

12. Connect the glow plug electrical connectors.

13. ⚠ WARNING: Before installing the components, ensure the area around the joint faces and connections are clean.

Connect and secure the low-pressure fuel lines.

- Remove the blanking caps from the ports.

14. ⚠ WARNING: Before installing the components, ensure the area around the joint faces and connections are clean.

⚠ CAUTION: The O-ring seal is to be reused unless damaged.

Install the oil filter element.

- Clean the components.
- Tighten the oil filter element cover to 25 Nm (18 lb.ft).

15. Install the intake air shutoff throttle.
For additional information, refer to: Intake Air Shutoff Throttle (303-04C Fuel Charging and Controls - TDV6 2.7L Diesel, Removal and Installation).

16. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

17. Check and top-up the engine oil.

18. Check and top-up the coolant.

19. Bleed the fuel system.

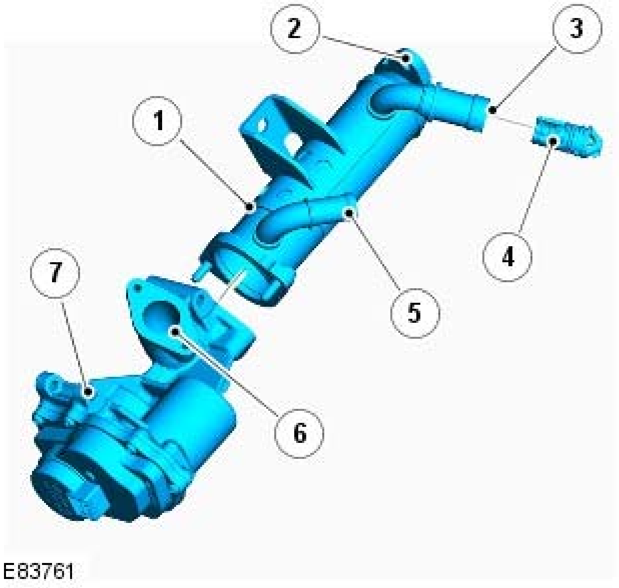
EGR SYSTEM

The EGR system comprises:

- EGR modulator x 2
- EGR cooler x 2
- Associated connecting pipes

The combined EGR modulator and cooler is located between the V of the cylinder banks. The cooler side of the EGR is connected to the vehicle cooling system, via hoses. The inlet exhaust side is connected to the exhaust manifolds on each side via a metal pipe. The exhaust gas passes through the cooler and is expelled via the actuator and a metal pipe into the throttle housing. The EGR modulator is a solenoid operated valve which is controlled by the engine control module (ECM). The ECM uses the EGR modulator to control the amount of exhaust gas being recirculated in order to reduce exhaust emissions and combustion noise. The EGR is enabled when the engine is at normal operating temperature and under cruising conditions.

EGR Valve and Cooler Asembly



Item	Part Number	Description
1	-	EGR cooler
2	-	EGR gas intake
3	-	EGR cooler coolant outlet
4	-	EGR coolant thermostat
5	-	EGR coolant inlet
6	-	EGR gas outlet
7	-	EGR valve

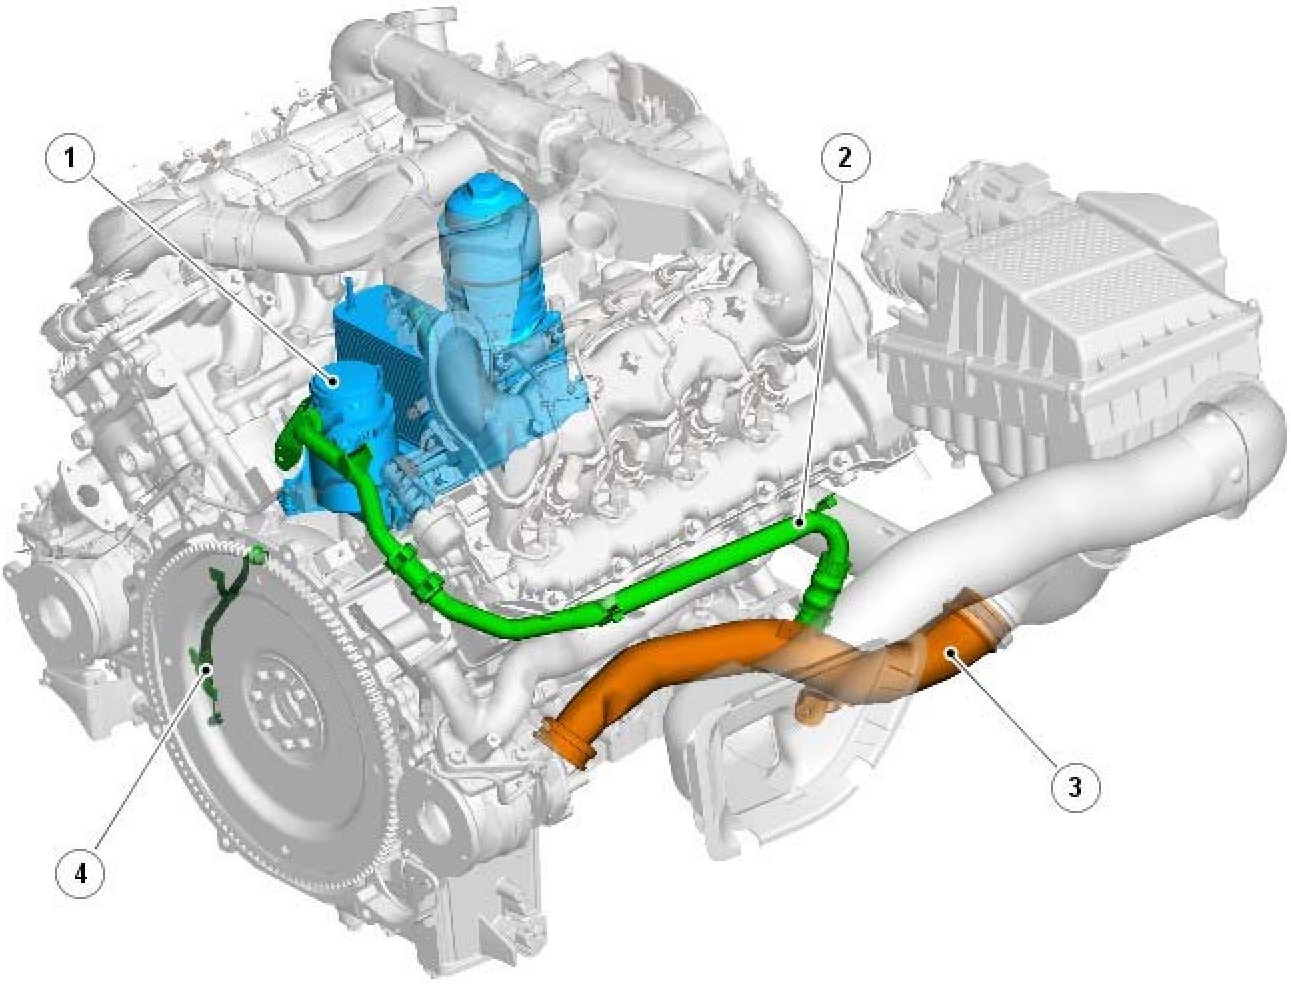
The EGR modulator receives a 12V supply from the main relay. The ground for the solenoid is via the ECM and is controlled using a pulse width modulation (PWM) signal. The PWM duty signal of the solenoid ground is varied to determine the precise amount of exhaust gas delivered to the cylinders.

The modulators are operated through their full range at each engine start-up, to clear any carbon deposits that may have built up whilst the engine was running.

In the event of a failure of the EGR modulator, the EGR function will become inoperative. The ECM can monitor the EGR modulator solenoid for short circuits and store fault codes in the event of failure. The modulator can also be activated for testing using the Land Rover recommended diagnostic tool.

Each EGR cooler has a thermostat located in the coolant outlet. This alows for more accurate control of the coolant temperature and the exhaust gas.

COMPONENT LOCATION



E86633

Item	Part Number	Description
1	-	Crankcase ventilation oil seperator
2	-	Crankcase ventilation gas breather to air intake pipe
3	-	Air intake pipe
4	-	Crankcase ventilation oil return drain pipe

CRANKCASE VENTILATION

The crankcase ventilation system on the engine ensures that all gasses emitted from the crankcase during engine running are separated from any oil particles.

Crankcase gasses are drawn internally into the oil separator unit located in the engine V. The oil separator removes oil from the crankcase gasses. The seperated gas is returned to the inlet side of the air induction system prior to the right-hand (RH) turbo charger. The oil is drained from the separator to the oil pan via an oil return pipe located at the rear of the cylinder block.

Diagnosis and Testing

Overview

For information on the description and operation of the emission control system:
REFER to: Engine Emission Control (303-08D Engine Emission Control - TDV8 3.6L Diesel, Description and Operation).

Inspection and verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual Inspection

Mechanical	Electrical
● Engine breather hoses ● Oil separator ● Exhaust gas recirculation (EGR) pipes (check for cracks) ● EGR valve(s) ● EGR cooler(s)	● Fuse(s) ● Wiring harness ● Loose or corroded electrical connector(s) ● Intake manifold tuning (IMT) valve ● EGR valve(s) ● Engine control module (ECM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom Chart

Symptom (specific)	Possible cause	Action
Difficult to start	● Exhaust gas recirculation (EGR) valve(s) stuck open	Check the EGR valve and circuits. Refer to the electrical guides. Check the mechanical condition of the EGR valves. Rectify as necessary.
Poor/Erratic idle		
Lack of power when accelerating		
Engine stops/stalls	● Exhaust gas recirculation (EGR) valve(s) stuck open ● Breather system disconnected/restricted/blocked	Check the EGR valve and circuits. Refer to the electrical guides. Check the mechanical condition of the EGR valves. Check the engine breather system. Check the oil separator. REFER to: Engine Emission Control (303-08D Engine Emission Control - TDV8 3.6L Diesel, Description and Operation). Check for DTCs indicating an EGR valve, throttle or sensor fault. Rectify as necessary.
Excessive fuel consumption	● Exhaust gas recirculation (EGR) valve(s) stuck open ● EGR not operating ● Breather system restricted/blocked	
Excessive black smoke		
Excessive emissions		
Excessive blow-by	● Breather system restricted/blocked	Check the engine breather hoses. Check the oil separator. REFER to: Engine Emission Control (303-08D Engine Emission Control - TDV8 3.6L Diesel, Description and Operation). Rectify as necessary.
Engine oil leaks	● Breather system restricted/blocked	Check the engine breather hoses. Check the oil separator. REFER to: Engine Emission Control (303-08D Engine Emission Control - TDV8 3.6L Diesel, Description and Operation). Rectify as necessary.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: For a full list of engine control module (ECM) DTCs:

REFER to: Electronic Engine Controls (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Diagnosis and Testing).

DTC	Description	Possible cause	Action
P040100	Exhaust gas recirculation (EGR) insufficient flow detected	● EGR control deviation lower limit, right-hand bank (intake manifold tuning (IMT) valve closed - bank specific control of EGR)	Allow the engine to warm up, switch off and turn the ignition on. Using a datalogger function, check the EGR valve angle for the right-hand bank. Command the valve actuator to 0% then 100% pulse width modulated (PWM) and recheck the values. The angle should range between 5% and 95%. If this is not the case, install a new valve as necessary. REFER to: Exhaust Gas Recirculation (EGR) Valve RH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P040121	Exhaust gas recirculation (EGR) insufficient flow detected - signal amplitude less than minimum	● EGR control deviation lower limit right-hand bank (intake manifold tuning (IMT) valve closed) bank specific control of EGR	Allow the engine to warm up, switch off and turn the ignition on. Using a datalogger function, check the EGR valve angles for both banks. Command the valve actuators to 100% then 0% pulse width modulated (PWM), and recheck the valve angles. The angles should range between 95% and 5%. If this is not the case, install new valves as necessary. Engine Emission Control - TDV8 3.6L Diesel - Exhaust Gas Recirculation (EGR) Valve LH

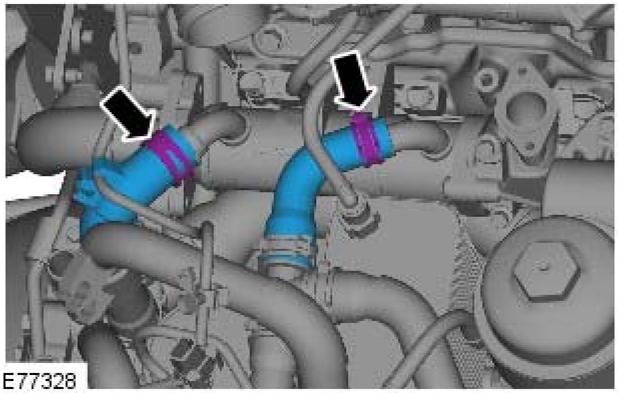
Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

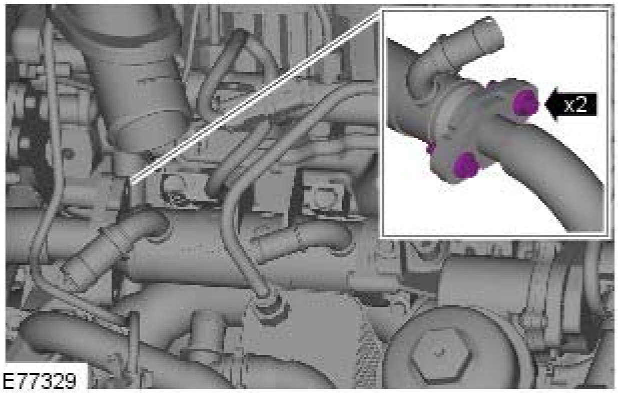
2. Remove the intake manifold plenum chamber.
For additional information, refer to: Intake Manifold Plenum Chamber (303-01D Engine - TDV8 3.6L Diesel, In-vehicle Repair).



3. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

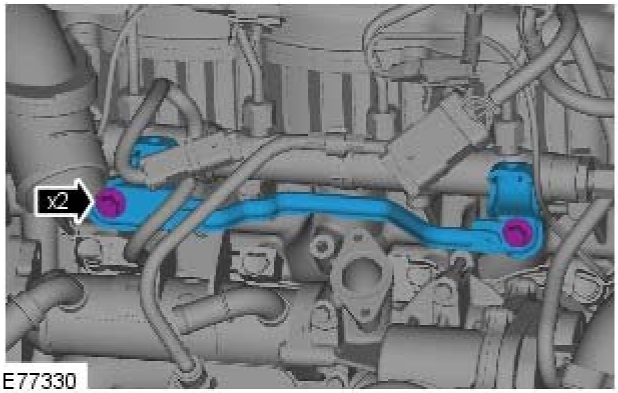
Disconnect the exhaust gas recirculation (EGR) cooler coolant hoses.

- Clamp the hoses to minimize coolant loss.
- Release the 2 clips.



4. Release the EGR valve inlet tube.

- Remove the 2 bolts.



5. Remove the fuel rail support bracket.

- Remove the 2 bolts.

7. NOTE: Do not disassemble further if the component is removed for access only.

Remove the EGR valve.

- Remove the 2 bolts.
- Remove and discard the gasket.

Installation

1. ⚠ CAUTION: Make sure that the mating faces are clean and free of foreign material.

Install the EGR valve.

- Install a new gasket.
- Tighten the bolts to 10 Nm (7 lb.ft).

2. ⚠ CAUTION: Make sure that the mating faces are clean and free of foreign material.

• NOTE: Remove and discard the blanking caps.

Install the EGR valve and cooler assembly.

- Install a new gasket.
- Tighten the bolts to 10 Nm (7 lb.ft).

3. Install the fuel rail support bracket.

- Tighten the bolts to 23 Nm (17 lb.ft).

4. Secure the EGR valve inlet tube.

- Tighten the bolts to 10 Nm (7 lb.ft).

5. NOTE: Remove and discard the blanking caps.

Connect the EGR cooler coolant hoses.

- Secure with the clips.
- Remove the hose clamps.

6. Install the intake manifold plenum chamber.
   For additional information, refer to: Intake Manifold Plenum Chamber (303-01D Engine - TDV8 3.6L Diesel, In-vehicle Repair).
7. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
8. Check and top-up the coolant if required.

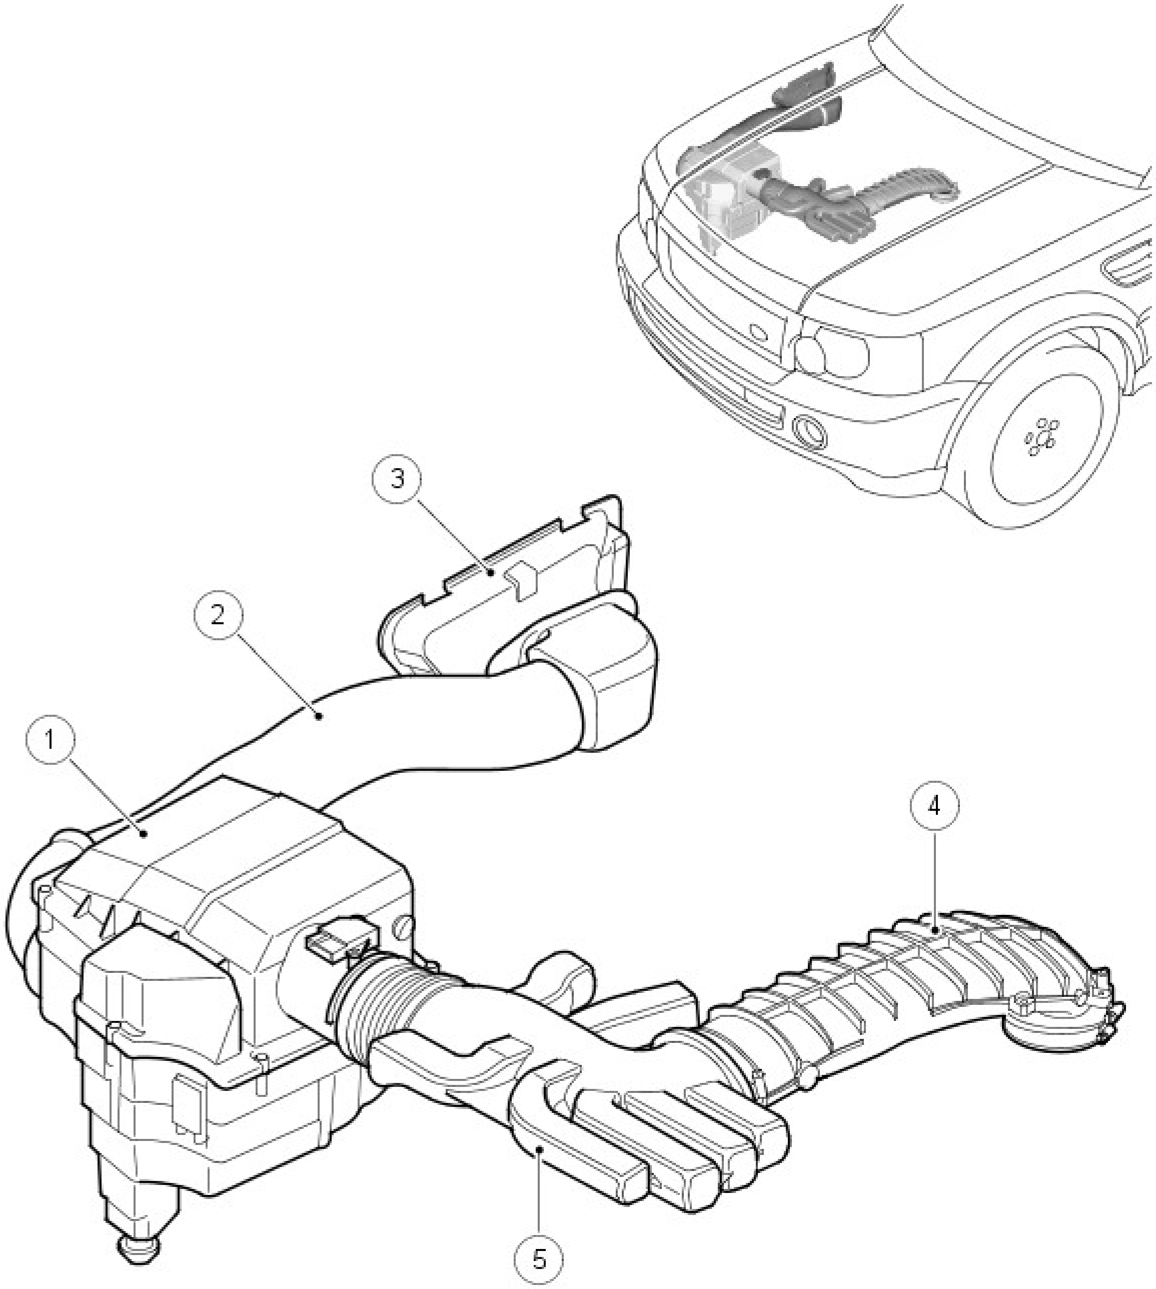
Intake Air Distribution and Filtering - V8 S/C 4.2L Petrol - Intake Air Distribution and Filtering

Description and Operation

AIR INTAKE SYSTEM



E56227

Item	Part Number	Description
1	-	Air filter box
2	-	Porous duct
3	-	Air intake
4	-	Throttle body intake
5	-	Induction resonator chambers

The 4.2 Liter V8 supercharger (SC) engine air intake and distribution system comprises:

- Air filter box
- Air intake

- Porus duct
- Air filter and filter box
- Intake duct
- Electronic throttle.

Air Filter Box

The air filter box is located in the front of the engine bay on the inside of the right-hand (RH) front wing. Air is drawn from the air intake in the wing through a porous duct and into the air filter box. The filter box contains a paper air filter element.

Air Intake Duct

The air intake duct runs from the throttle body to the air filter box. The duct comprises two separate pieces. One piece runs from the air filter box to the front of the engine and the other from the front of the engine to the rear of the engine locating on the throttle body. The front half is manufactured from plastic and incorporates a number of resonator chambers. The rear part of the duct is manufactured from cast aluminum.

Diagnosis and Testing

Overview

For information on the description and operation of the intake system, refer to the relevant workshop manual section.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of damage.

Visual inspection

Mechanical	Electrical
• Hoses and ducts (damage/connections) • Air cleaner element (contaminated/blocked) • Restricted air intake • Supercharger • Supercharger (cooling fan) drive belt • Supercharger seals and gaskets • Charge air coolers (damage/connection)	• Mass air flow (MAF) sensor • Manifold absolute pressure (MAP) sensor • Manifold absolute pressure/temperature (MAPT) sensor • Throttle body • Harness (security/damage) • Connections (security/damage)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any DTCs before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom chart

Symptom	Possible causes	Action
Vehicle does not start/hard starting/poor performance	• Restricted/Blocked air intake • Restricted/Blocked air cleaner element	Clear the restriction. Replace the air cleaner element as necessary.
Excessive intake noise	• Intake pipe disconnected/damaged after the air cleaner • Air cleaner assembly incorrectly assembled/damaged	Check the intake system and hoses for correct installation/damage.
Lack of boost	• Supercharger drive belt broken/slipping • Supercharger fault • supercharger air intake fault • Major air leakage (after the supercharger)	Check the supercharger and drive belt. Check the charge air coolers.
Noise	• Supercharger drive belt slipping • Supercharger fault • Major air leakage (after the supercharger)	Check the supercharger and drive belt. Remove the supercharger drive belt and recheck for noise. Turn the supercharger by hand and check for excessive resistance. Check for excessive play at the supercharger pulley. Check the charge air coolers.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: For a full list of ECM DTCs, refer to workshop manual section 303-14 - Electronic Engine Controls.

DTC	Description	Possible causes	Action
P010100	Mass or Volume Air Flow A Circuit	● Blocked air cleaner ● Air intake leak ● Engine breather leak ● Mass air flow (MAF) sensor sensing circuit high resistance, intermittent short circuit to ground ● MAF sensor supply circuit high resistance	Check the air cleaner for blockage, etc. Check the air intake system for leaks. Check the engine breather system. Refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P010600	Manifold Absolute Pressure/BARO Sensor Range/Performance	● Intake manifold air leak (loose or missing component) ● MAP sensor circuit(s) fault ● MAP sensor failure	Check the intake manifold for security, etc. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P017100	System Too Lean (Bank 1)	● Air intake leak between MAF sensor and cylinder head ● MAF sensor fault (low intake air flow) ● Fuel filter/system restriction ● Low fuel pressure ● Fuel injector restriction ● Exhaust leak (before catalyst) ● Evaporative emission system fault	Check the intake air system for leaks, etc. Check the fuel system for restrictions, DTCs, etc. Check the exhaust system for leaks, etc. Check for evaporative emission DTCs.
P017200	System Too Rich (Bank 1)	● Restricted air filter ● High fuel pressure ● Leaking fuel injector(s) ● Oil contaminated with fuel (too many cold starts with vehicle subsequently not getting hot enough for long enough) ● MAF sensor fault ● Evaporative emission system fault	Check the intake air system for restrictions, etc. Check the fuel system for leaks, DTCs, etc. Check the oil condition. Check for MAF sensor and evaporative emission DTCs.
P017400	System Too Lean (Bank 2)	● Air intake leak between MAF sensor and cylinder head ● MAF sensor fault (low intake air flow) ● Fuel filter/system restriction ● Low fuel pressure ● Fuel injector restriction ● Exhaust leak (before catalyst) ● Evaporative emission system fault	Check the intake air system for leaks, etc. Check the fuel system for restrictions, DTCs, etc. Check the exhaust system for leaks, etc. Check for evaporative emission DTCS.
P017500	System too Rich (Bank 2)	● Restricted air filter ● High fuel pressure ● Leaking fuel injector(s) ● Oil contaminated with fuel (too many cold starts with vehicle subsequently not getting hot enough for long enough) ● MAF sensor fault ● Evaporative emission system fault	Check the intake air system for restrictions, etc. Check the fuel system for leaks, DTCs, etc. Check the oil condition. Check for MAF sensor and evaporative emission DTCs.
P050600	Idle Air Control System RPM Lower Than Expected	● Air intake restriction ● Accessory drive overload (defective/seized component)	Check the air intake system. Check the accessory drive belt and components. Refer to the relevant workshop manual section.

DTC	Description	Possible causes	Action
P050700	Idle Air Control System RPM Higher Than Expected	● Intake air leak between the mass air flow (MAF) sensor and throttle ● Intake air leak between throttle and engine ● Engine crankcase breather leak	Check the air intake system. Check the engine breather system. Refer to the relevant workshop manual section.

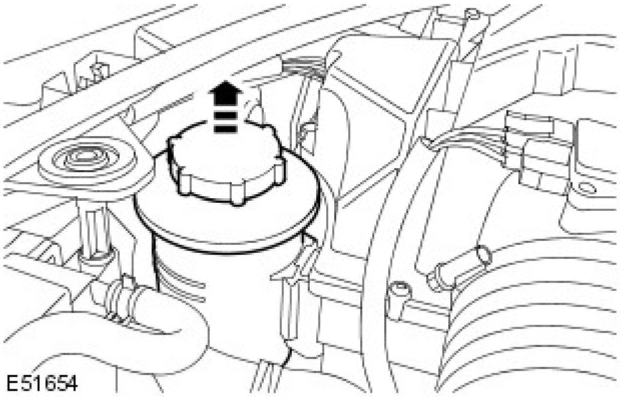
Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Release the Dynamic Response reservoir.



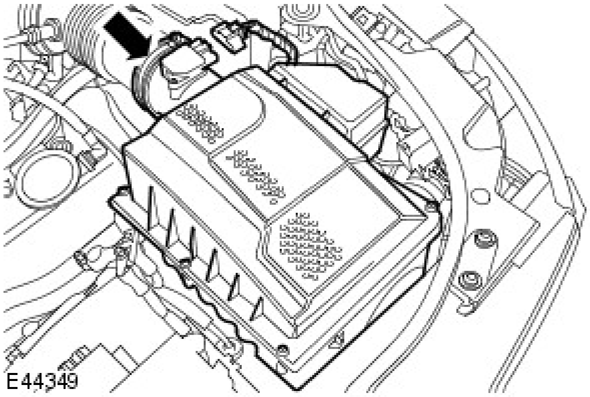
- Release the clip.
- Tie the reservoir aside.

3. Disconnect the air intake resonator.

- Release the clip.

4. Disconnect the mass air flow (MAF) sensor electrical connector.

5. Remove the air cleaner assembly.



Installation

1. NOTE: When installing the air cleaner, make sure the locating pegs fit securely into the grommets.

To install, reverse the removal procedure.

4	-	Intake manifold
5	-	Electronic throttle

The 4.4 Liter V8 engine air intake and distribution system comprises:

- Air filter box
- Air intake
- Intake manifold
- Electronic throttle

Air Filter Box

The air filter box is located in the front of the engine bay on the inside of the right-hand (RH) front wing. Air is drawn from the air intake in the wing through a porous duct and into the air filter box.

Intake Manifold

The intake manifold is located on top of the engine between the two engine banks. The manifold is manufactured from a composite material with metal insert fixings. The intake manifold comprises a central chamber with eight tracts leading to the inlet ports on the engine.

Diagnosis and Testing

Overview

For information on the description and operation of the intake system, refer to the relevant workshop manual section.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of damage.

Visual inspection chart

Mechanical	Electrical
• Hoses and ducts (damage/connections) • Air cleaner element (contaminated/blocked) • Restricted air intake	• Mass air flow (MAF) sensor • Manifold absolute pressure (MAP) sensor • Throttle body • Harness (security/damage) • Connections (security/damage)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
   - Make sure that all DTCs are cleared following rectification.

Symptom chart

Symptom	Possible cause	Action
Vehicle does not start/hard starting/poor performance	• Restricted/Blocked air intake • Restricted/Blocked air cleaner element	Clear the restriction. Replace the air cleaner element as necessary.
Excessive intake noise	• Intake pipe disconnected/damaged after the air cleaner • Air cleaner assembly incorrectly assembled/damaged	Check the intake system and hoses for correct installation/damage.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: For a full list of ECM DTCs, refer to workshop manual section 303-14 - Electronic Engine Controls.

DTC	Description	Possible causes	Action
P010100	Mass or Volume Air Flow A Circuit	• Blocked air cleaner • Air intake leak • Engine breather leak • Mass air flow (MAF) sensor sensing circuit high resistance, intermittent short circuit to ground • MAF sensor supply circuit high resistance	Check the air cleaner for blockage, etc. Check the air intake system for leaks. Check the engine breather system. Refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P010600	Manifold Absolute Pressure/BARO Sensor Range/Performance	• Intake manifold air leak (loose or missing component) • MAP sensor circuit(s) fault • MAP sensor failure	Check the intake manifold for security, etc. Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P017100	System Too Lean (Bank 1)	● Air intake leak between MAF sensor and cylinder head ● MAF sensor fault (low intake air flow) ● Fuel filter/system restriction ● Low fuel pressure ● Fuel injector restriction ● Exhaust leak (before catalyst) ● Evaporative emission system fault	Check the intake air system for leaks, etc. Check the fuel system for restrictions, DTCs, etc. Check the exhaust system for leaks, etc. Check for evaporative emission DTCs.
P017200	System Too Rich (Bank 1)	● Restricted air filter ● High fuel pressure ● Leaking fuel injector(s) ● Oil contaminated with fuel (too many cold starts with vehicle subsequently not getting hot enough for long enough) ● MAF sensor fault ● Evaporative emission system fault	Check the intake air system for restrictions, etc. Check the fuel system for leaks, DTCs, etc. Check the oil condition. Check for MAF sensor and evaporative emission DTCs.
P017400	System Too Lean (Bank 2)	● Air intake leak between MAF sensor and cylinder head ● MAF sensor fault (low intake air flow) ● Fuel filter/system restriction ● Low fuel pressure ● Fuel injector restriction ● Exhaust leak (before catalyst) ● Evaporative emission system fault	Check the intake air system for leaks, etc. Check the fuel system for restrictions, DTCs, etc. Check the exhaust system for leaks, etc. Check for evaporative emission DTCS.
P017500	System too Rich (Bank 2)	● Restricted air filter ● High fuel pressure ● Leaking fuel injector(s) ● Oil contaminated with fuel (too many cold starts with vehicle subsequently not getting hot enough for long enough) ● MAF sensor fault ● Evaporative emission system fault	Check the intake air system for restrictions, etc. Check the fuel system for leaks, DTCs, etc. Check the oil condition. Check for MAF sensor and evaporative emission DTCs.
P050600	Idle Air Control System RPM Lower Than Expected	● Air intake restriction ● Accessory drive overload (defective/seized component)	Check the air intake system. Check the accessory drive belt and components. Refer to the relevant workshop manual section.
P050700	Idle Air Control System RPM Higher Than Expected	● Intake air leak between the mass air flow (MAF) sensor and throttle ● Intake air leak between throttle and engine ● Engine crankcase breather leak	Check the air intake system. Check the engine breather system. Refer to the relevant workshop manual section.

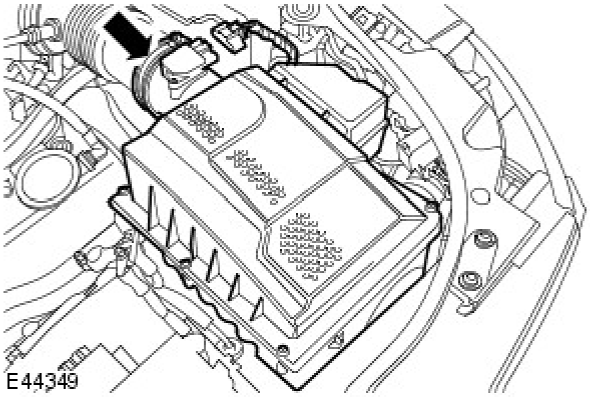
Removal and Installation

Removal

1. Disconnect the battery ground cable.
2. Release the air cleaner intake pipe.
    - Loosen the air cleaner intake pipe clip.
3. Disconnect the mass air flow (MAF) sensor electrical connector.
4. Remove the air cleaner assembly.



Installation

1. NOTE: When installing the air cleaner, make sure the locating pegs fit securely into the grommets.

To install, reverse the removal procedure.

The 2.7 Liter Diesel air intake and distribution system comprises:

- Wing mounted intake duct
- A filter minder sensor
- Camshaft cover mounted intake manifolds (x2)
- Charge air cooler
- Turbo charger

Air is drawn in from the vehicle exterior via the right-hand (RH) wing mounted intake duct, along the inside of the wing to the air filter box intake. Once the air has passed through the air filter it is drawn along a duct to the turbo charger. From the turbo charger the air is forced through the charge air cooler up to the electric throttle assembly and then to the inlet manifold assembly.

OVERVIEW

The intake air distribution system comprises:

- Twin MAF/intake air temperature (IAT) sensors
- Air cleaner and air cleaner housing
- Charge air cooler
- Twin turbochargers
- Intake port deactivation system

Air is drawn in from the vehicle exterior via the right-hand (RH) wing mounted intake duct, along the inside of the wing to the air cleaner housing intake. The air passes through the air cleaner and exits the air cleaner housing via 2 ports. The clean air then passes through a MAF/IAT sensor (1 per cylinder bank) and is drawn down to the turbochargers. The turbocharger forces the air up to the charge air cooler and out to the electric throttles, where it then flows into the respective intake air manifolds and down to the cylinder heads. The air intake manifold has a variable intake valve which allows the two sides of the manifolds to be connected/separated to balance the airflow.

PORT DEACTIVATION

The cylinder head of the engine has been designed to optimize levels of swirl across the engine speed range. If there is too much swirl as fuel is injected, the high velocity of the swirling gases prevent the jets of atomized fuel reaching the edges of the combustion chamber which will result in poor combustion and higher than normal emissions.

The TDV8 engine features a port deactivation system to achieve the correct amount of swirl in the cylinder.

Each cylinder features two intake ports one is designed as a helical 'swirl' port, configured to create the optimum swirl for good combustion whilst the other is designed as a 'filling-port', capable of supplying high volumes of air without disturbing in-cylinder swirl.

The helical port is open under all operating conditions. At low loads, gas flow is so low that the filling port is closed off raising the gas velocity through the helical port to increase in-cylinder swirl to the required rate. The filling port is opened under high gas-flow conditions to help maintain consistent optimum swirl across the engine's operating range. This ensures that even under high gas flow conditions the amount of swirl is regulated to the optimum amount.

Port deactivation is controlled by butterfly valves operating within the intake manifold. The valves are controlled by vacuum operated solenoids at the rear of each cylinder head. The vacuum solenoids are operated by a vacuum control solenoid in response to control signals from the engine control module (ECM). The solenoids are linked to the butterfly valves via a small arm and cam.

Diagnosis and Testing

Overview

For information on the description and operation of the intake air distribution and filtering system:
REFER to: Intake Air Distribution and Filtering (303-12D Intake Air Distribution and Filtering - TDV8 3.6L Diesel, Description and Operation).

Inspection and verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual Inspection

Mechanical	Electrical
● Hoses and ducts: condition and fitment ● Air cleaner element condition and fitment ● Restricted air intake ● Vacuum hoses condition and fitment ● Pipework to/from turbochargers: condition and fitment ● Turbochargers: condition and fitment ● Charge air coolers	● Fuse(s) ● Wiring harness(es) ● Loose or corroded electrical connector(s) ● Mass air flow (MAF) sensors ● Manifold absolute pressure/temperature (MAPT) sensors ● Intake air temperature (IAT) sensor - The IAT sensor is built into the right-hand MAF sensor ● Intake manifold tuning (IMT) valve

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom chart

Symptom	Possible causes	Action
Vehicle does not start/hard starting	● Restricted/Blocked air intake ● Restricted/Blocked air cleaner element	Check the intake air system for blockages or restriction. Rectify as necessary.
Poor performance	● Intake air system fault ● Turbocharger fault(s) ● Exhaust gas recirculation (EGR) valve(s) fault ● Low fuel pressure ● Restricted exhaust system	Check the intake air system for blockages or restriction. Rectify as necessary. Check for DTCs indicating a turbocharger, EGR valve or fuel pressure fault. Rectify as necessary. Check the exhaust system for evidence of damage or restriction. Rectify as necessary.
Excessive intake noise	● Intake air leak after the turbocharger ● Intake pipe disconnected/damaged after the air cleaner ● Air cleaner assembly incorrectly assembled/damaged	Check the intake air system for loose or disconnected hoses or ducts. Check the hoses and ducts for damage, splits, etc. Rectify as necessary.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: For a full list of engine control module (ECM) DTCs:
REFER to: Electronic Engine Controls (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Diagnosis and Testing).

DTC	Description	Possible causes	Action
P006A21	Manifold absolute pressure temperature (MAPT) sensor - mass or volume air flow correlation - signal amplitude less than minimum	● Air leakage in the intake path between the turbocharger and the engine	Check the intake air system for leakage after the turbocharger. Check for DTCs indicating a MAPT sensor fault. Clear the DTCs and test for normal operation.
P006A22	Manifold absolute pressure and temperature (MAPT) sensor - mass or volume air flow correlation, right-hand bank - signal amplitude greater than maximum	● Oil ingress into the intake manifold ● MAPT sensor circuit fault ● MAPT sensor fault ● MAF sensor fault ● Turbocharger fault	With the engine at idle, check the manifold air pressure and indicated torque set points using a datalogger function. If the manifold air pressure is greater than 140 KPa (20.31 lbs/in²) or the torque less than 70 Nm (51.63 lbf/ft), check for oil being drawn into the intake manifold. Rectify as necessary. Clear the DTCs and test for normal operation. Stop the engine and turn the ignition on. Using a datalogger function, monitor the turbocharger actuator angles. Command the actuator to 5% pulse width modulated (PWM) then to 95% pulse PWM and check the angle values. The angle at 5% PWM should be 0 - 20%, and at 95% 80 - 95%. If the values are inside this range, install a new MAF sensor. REFER to: Manifold Absolute Pressure and Temperature (MAPT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). If the values are outside this range, install a new turbocharger. REFER to: Turbocharger RH (303-04F Fuel Charging and Controls - Turbocharger - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P007C16	Right-hand charge air temperature sensor circuit low (the charge air temperature sensor is part of the manifold absolute pressure and temperature (MAPT) sensor)	● Charge air temperature sensor circuit: high resistance ● Charge air temperature sensor circuit: short circuit to ground ● Right-hand MAPT sensor fault	Check the right-hand MAPT sensor and circuits. Refer to the electrical guides. Check the resistance of the temperature sensor (pins 1 and 4 of the MAPT). Nominal resistance at 20 °C (68 °F) should be 2.5 Kohms. Install a new MAPT if necessary. REFER to: Manifold Absolute Pressure and Temperature (MAPT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P007D17	Right-hand charge air temperature sensor circuit high (the charge air temperature sensor is part of the manifold absolute pressure and temperature (MAPT) sensor)	● Charge air temperature sensor circuit: short circuit to power ● Right-hand MAPT sensor fault	Check the right-hand MAPT sensor and circuits. Refer to the electrical guides. Check the resistance of the temperature sensor (pins 1 and 4 of the MAPT). Nominal resistance at 20 °C (68 °F) should be 2.5 Kohms. Install a new MAPT if necessary. REFER to: Manifold Absolute Pressure and Temperature (MAPT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P007E27	Right-hand charge air temperature sensor circuit intermittent/erratic (the charge air temperature sensor is part of the manifold absolute pressure and temperature (MAPT) sensor)	● Charge air temperature sensor circuit: high resistance ● Charge air temperature sensor circuit: short circuit to ground ● Charge air temperature sensor circuit: short circuit to power ● Right-hand MAPT sensor fault	Check the right-hand MAPT sensor and circuits. Refer to the electrical guides. With the engine running and at operating temperature, check the boost air temperature using a datalogger function. Record the measurement at idle and increase the engine speed to 3,000 rpm. Record the reading and compare with the idle figure. If the value has increased by more than 20 °C in 100 ms, install a new sensor. DTC	Description	Possible causes	Action
P010F62	Mass or volume air flow sensor right/left-hand correlation - signal compare fault (difference between right and left-hand mass air flow sensors too great)	● MAF sensor circuit: short circuit to ground ● MAF sensor circuit: short circuit to power ● MAF sensor circuit: high resistance ● Air leakage in the intake path	Check the left-hand MAF sensor and circuits. Refer to the electrical guides. Check the intake air path for leaks. Check the MAF sensor for carbon or oil contamination. Install a new MAF sensor as necessary. REFER to: Mass Air Flow (MAF) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P011216	Intake air temperature (IAT) sensor circuit low input - voltage below threshold (the IAT sensor is part of the right-hand MAF sensor. The IAT sensor in the left-hand MAF is not used)	● IAT sensor circuit: high resistance ● IAT sensor circuit: short circuit to ground ● IAT sensor fault	Check the IAT sensor and circuits. Refer to the electrical guides. Measure the resistance of the IAT sensor (pins 2 and 3 of the MAF sensor). Nominal resistance at 20 °C (68 °F) should be 2.5 Kohms. As the two MAF sensors are identical, it is possible to confirm the diagnosis by swapping the units from side to side and testing to see if the DTC resets.
P011317	Intake air temperature (IAT) sensor circuit high input - voltage above threshold (the IAT sensor is part of the right-hand MAF sensor. The IAT sensor in the left-hand MAF is not used)	● IAT sensor circuit: short circuit to power ● IAT sensor fault	Check the IAT sensor and circuits. Refer to the electrical guides. Measure the resistance of the IAT sensor (pins 2 and 3 of the MAF sensor). Nominal resistance at 20 °C (68 °F) should be 2.5 Kohms. As the two MAF sensors are identical, it is possible to confirm the diagnosis by swapping the units from side to side and testing to see if the DTC resets.
P011427	Intake air temperature (IAT) sensor intermittent/erratic - signal rate of change above threshold (the IAT sensor is part of the right-hand MAF sensor. The IAT sensor in the left-hand MAF is not used)	● IAT sensor circuit: intermittent high resistance ● IAT sensor fault	Check the IAT sensor and circuits. Refer to the electrical guides. Start the engine and allow to warm up. Read the intake air temperature using a datalogger function and record the value. After ten minutes, read the value again and compare to the first reading. If the value has increased by more than 10°C per 100 ms swap the MAF sensors side to side and recheck.
P011C00	Right-hand bank charge air temperature (MAPT)/intake air temperature (IAT) sensor correlation - signal invalid (the IAT sensor is part of the right-hand MAF sensor. The IAT sensor in the left-hand MAF is not used)	● Right-hand MAPT sensor temperature circuits: short circuit to ground ● Right-hand MAPT sensor temperature circuits: short circuit to power ● Right-hand MAPT sensor temperature circuits: high resistance ● Right-hand MAPT sensor fault ● Right-hand MAF sensor temperature circuits: short circuit to ground ● Right-hand MAF sensor temperature circuits: short circuit to power ● Right-hand MAF sensor temperature circuits: high resistance ● Right-hand MAF	Check the right-hand MAPT and MAF sensors and circuits. Refer to the electrical guides. Monitor the charge air temperature and intake air temperature signals using a datalogger function. Start the engine and "wiggle" the sensor connectors with the engine running. Check the recorded values for the two sensors, the maximum difference should not exceed +40 °C to -30 °C (104 °F to -22 °F). If the IAT sensor is suspect, swap the MAF sensors side to side and recheck. If the fault remains, install a new right-hand MAPT sensor. REFER to: Manifold Absolute Pressure and Temperature (MAPT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.

If the values are significantly different, install a new right-hand MAPT sensor. REFER to: Manifold Absolute Pressure and Temperature (MAPT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation. Compare the right-hand bank manifold absolute pressure with ambient pressure. If the difference exceeds 20 Kpa (2.90 lbs/in²), suspect the ECM. Start the engine and allow to idle. Check the manifold absolute pressure in both banks and compare with the values at ignition on, engine not running. The pressures should have increased together to between 52.7 Kpa and 120 Kpa (7.64 and 17.40 lbs/in²). If this is not the case, install a new MAPT sensor. REFER to: Manifold Absolute Pressure and Temperature (MAPT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Refer to the warranty policy and procedures manual if a module is suspect.
P200813	Intake manifold runner (port deactivation) control circuit open	● Port deactivation control circuit: high resistance	Check the port deactivation valve and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new valve. Clear the DTCs and test for normal operation.
P200911	Intake manifold runner (port deactivation) control circuit low	● Port deactivation control circuit: short circuit to ground	Check the port deactivation valve and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new valve. Clear the DTCs and test for normal operation.
